The work of pumping out the shaft at the Kirkland Lake Gold property, owned by the Beaver Mining Company of Cobalt, is now under way. It is understood mining operations will be commenced in the near future. The mine was shut down a few months ago presumably due to lack of money in the Beaver treasury to meet the expenditure necessary for the successful operation of the property. The Beaver paid \$300,000 for this property and also financed the development of same to a depth of 700 ft., in the course of which \$750,000 in ore was put in sight. Since the suspension of operations at the property the machinery for the new 150-ton mill has been taken in and the work of construction on this plant is proceeding. It is expected the production of gold will commence by the end of the present summer. The new central shaft commenced last fall will be continued to the lower levels of the mine and connected up with the drifts run from the original working shaft.

Alexo Nickel Output.

The production of nickel ore from the Alexo Mine for the month of April exceeded one million pounds. This is the second month during the current year that the output has passed the million pound mark. For the year ended April 30th, 1918, the mine shipped 151 cars containing approximately 12,669,400 pounds, which is at the rate of over one million pounds per month. The ore is shipped to the Mond Nickel Company at Sudbury.

Producing \$75,000 Silver and Gold Per Day.

The silver and gold production of Cobalt, Porcupine and Kirkland Lake at the present time approximate \$75,000 every twenty-four hours. This output is made up of approximately \$50,000 from the mines of Cobalt and \$25,000 from the gold mines of Porcupine and Kirkland Lake.

Oil at Wahnapiatae Crossing.

A discovery of oil has been made on the Canadian Northern Railway about seventy miles northwest of North Bay, near the boundary between the townships of Street and Scadding and within a stone's throw of the crossing of the railway over the Wahnapiatae river. The first claims were recorded the last Wednesday in May. The new find has caused considerable excitement in the district and already a number from here are on their way to the scene of the discovery. A settler first discovered the presence of oil near the railway crossing over a year ago, soon after the occurrence of a seismic disturbance which was plainly felt throughout the north country, including the Cobalt and Sudbury districts. Attracted by the odor of oil the settler investigated and found oil oozing up through the sand. It was recently brought to the attention of men who recognized its possibilities. The geology is not favorable and caution seems advisable.

Schumacher.

Recent operations at the Schumacher mine have been of a sufficiently encouraging nature to lead to the belief

that the operations at this property may be continued despite the trying times. Due to better ore and efficient management profits from the mill have been increased to such an extent that the mine manager, Mr. Harwood, will confer with the directors in Toronto shortly as to the advisability of keeping the mill running. Costs due to suspended development are considerably lower.

Crown Reserve Develops Gowganda Property.

High grade silver ore has been discovered at the 100 ft. level of the Walsh property in the Gowganda district, under option to and being worked by the Crown Reserve Mining Company of Cobalt. As to whether or not the discovery is of special importance cannot be decided until further work has been done. A number of veins have been cut in the crosscut at the 100-ft. level and the one in which the values have been found is said to be from five to eight inches in width. The shaft will be continued to a depth of 200 ft. and further lateral work carried on from this point. The Walsh property is in close proximity to the rich Miller Lake-O'Brien.

Hill Gold Mines.

The new mill at the Hill Gold Mines property in the Painkiller Lake district of the Munro mining field is in the final stages of installation, and would even now be in operation were it not for the fact that delays have occurred in the delivery of certain parts. However, it is expected the mill will be completed and in operation within the next two weeks. The mill is designed for the treatment of about 70 tons per day, but it is the intention of the management to treat only about forty tons for the time being. Several hundred feet of lateral work has been done at the property and the shaft is now being sunk to a depth of 200 ft.

Adanac.

Work in the north crosscut at the 310 ft. level of the Adanac mine was driven a distance of 101 ft. during the month of May. A number of small veins were cut, the last vein being from one to two inches in width and contained considerable cobalt. The veins are dipping a little to the north and it is evident some little distance remains to go yet before encountering the zone of enrichment, which it was expected would have been entered by the first of the current month. The conditions met with underground are highly favorable and the trend of the work is more than ever the centre of interest in the camp. The operating costs during the month were less than \$1,800 and amount to \$17.65 per foot of work done.

Prospecting in Ogden Township.

Considerable activity is apparent in the district four miles south of the Hayden Gold Mines in the township of Ogden. Two gangs of men are working, one on a property north of Gold Lake, and the other south of Gold Lake, where the Moffat claims are being opened up. The work consists chiefly of surface exploration.

SMITH & TRAVERS COMPANY, LIMITED.

The Smith & Travers Diamond Drill Co., Ltd., and the Smith & Durkee Diamond Drilling Co., Ltd., both of Sudbury, have disposed of all their assets to a new company to be known as the Smith & Travers Co., Ltd.

During the month of May 13, Cobalt mining companies shipped an aggregate of 53 car-loads of ore, containing approximately 4,084,150 pounds of ore. Compared with April the May output shows a very marked increase, the figures for the former month being 2,320,661 pounds.

BRITISH COLUMBIA.

The Belmont Gold Mine, Surf Inlet.

One of the most noteworthy mining developments in British Columbia during the past year is that of the Belmont-Surf Inlet Mines, which consist of about nine claims situated about six miles from the head of Surf Inlet in the Skeena Mining Division. This property came into the shipping class last year and, with the installation of a complete plant, is expected to make a very fine showing in 1918. The ore is a pyritized quartz carrying chiefly gold values, with a little silver and copper. The ore is concentrated about 10 to 1 and in the \$125 and \$135 concentrate the gold values run about \$120; silver, 6 oz.; and copper, 2.5 per cent.

The Belmont Canadian Mines, Ltd., developed and bought the property and re-organized into the present company. During the period that the property has been in possession of the new company, Sept. 1, 1917, the net income has been \$86,154. Some unforeseen interruptions for a time kept down the output, which since has been maintained at about 300 tons a day.

In discussing this property Mr. George Clothier, Government Engineer, after describing the plant being installed, says, in part:

"The quartz lies in two well-defined shear-zones in gneissoid granite; the main fracture, in which the main tunnel was driven, splitting into the two about 300 ft. south of the quartz bodies. They occur in lenticular bodies varying in width up to 40 ft., averaging about 10 ft. On the main working level, the 550-ft., the quartz is practically continuous for 800 ft., in which there are developed about 400 ft. of milling ore. This is in the west or hanging-wall zone. From this level a winze has been sunk about the centre of the ore shoot to a depth of 265 ft. on the dip of the vein and 700 ft. of drifting done from the bottom both ways. This was full of water at the time of my visit, but I was informed by the general superintendent that they opened up an exceptionally fine shoot of ore, over 500 ft. in length and averaging about 16 ft. in width."

Mr. Clyde A. Hallett, Philadelphia, is president of the company, and Mr. W. M. Potts, of the same city, vice-president. Mr. J. K. Kitto, Philadelphia, is secretary and treasurer and Mr. B. G. Hawkins, of Vancouver, the assistant secretary.

Standard Silver-Lead.

Reports from Silverton, B.C., indicate that the strike made on the property of the Standard Silver-Lead Mining Company is growing in importance as the development proceeds. The shoot had been followed by drift for 150 ft. some time ago. It since has been proved for an additional length of 200 ft., making the total length 350 ft. The report states that the width of the body varies from 5 to 12 ft. The ore is of a good mining grade. The initial disclosure was on the No. 5 level at a depth of several hundred feet. Ore was followed by winze for 45 ft. It is from the bottom of the winze that development is in progress. In order to permit an ascent by raise from the No. 6 level, development was suspended for a month. The raise is 185 ft. long and has provided ventilation and an economical outlet for ore and waste. There is indecision as to whether the ore undergoing development is a new lens or part of that from which the company removed \$7,000,000 or more in lead-silver-zinc ore. It will add generously to the reserves in any event, but if its independence of the main body is established expectations may be built on resources above and below the horizon of current development. The possibilities overhead are about 700 ft.

Ore-bodies in the Standard have always been erratic in spite of their enormous yields, a fine stope being succeeded often by a short barren section and it in turn by a zone of solid lead. These characteristics have not occurred in any marked degree at the scene of current development. There have been few extremities of impoverishment and riches. Values have been distributed on a basis that approached evenness.

Silversmith Mines, Ltd.

The Silversmith Mines, Ltd., is now the name of the property situated at Sandon, B.C., and previously known as the Slocan Star. A certificate of incorporation has been issued to the Silversmith Mines, Ltd. (non-personal liability) for \$750,000. Some time ago the shareholders decided upon a re-organization and Mr. R. H. Stewart, formerly general manager of the Canadian Consolidated Mining & Smelting Co., has been appointed manager of the new company. It is announced that the mine will commence operations at an early date.

Cork-Province.

The Cork-Province near Kaslo B.C., has added a ball mill and a flotation unit to its concentrator at a cost of \$15,000. The flotation unit will be used for dressing the silver zinc tailings that have been thrown away in the past. The zinc concentrates are shipped to Kansas U.S.A., and the lead goes to the Trail smelter.

St. Keverne.

The St. Keverne group on Payne Mountain in the Slocan will be worked this summer. Oscar White, formerly of the Slocan Star, will be manager.

Cariboo.

Mining men and the public generally in some sections of the British Columbia interior are agitating for some celebration of the 60th anniversary of the discovery of gold in the Cariboo district and the building of the famous Cariboo Road. The movement started at Clinton, B.C., and is being met with favor, it being felt that something should be done to mark and commemorate an event of so much importance and interest as to merit a few pages in Canadian history, particularly in the mining history of Western Canada.

Platinum in B.C.

Owing to the importance of platinum for war purposes and its consequent augmentation in value, the former point being emphasized by the fact that both the United States and Canada have prohibited its export, general interest in the mineral has been roused among British Columbia prospectors. In this connection it has been recalled that platinum occurs, associated with placer gold, in the vicinity of Quesnel Forks, B.C., in the Cariboo district. Mr. John Hobson, when operating the Bullion Hydraulic Gold Mining Co. in that section, recovering a small quantity each year. The discovery of its sources is one of the matters which, it is believed, will be investigated by a party consisting of Messrs. J. B. Tyrrell, the well-known Canadian mineralogist and geologist, representing the Anglo-French Corporation of London; Robert A. Bryce, M.E., representing Porcupine and Cobalt mining interests, and Mr. Gordon Taylor, representing Toronto, Ont., mining interests.

With regard to the matter of platinum in Cariboo, it is interesting to quote Mr. Fleet Robertson, Provincial Mineralogist, in his annual report of the year 1902, when he said: "I found that there were very small quantities of platinum in the Fraser River bars. I traced this up to Quesnel, where the Quesnel river enters the Fraser, above which point I could find but

little in the Fraser river, as it chiefly seemed to be brought in by the Quesnel, which was traced up to Horsefly." He adds that he knows of no platinum occurring in a place in Cariboo, but that British Columbia has platinum also occurring with placer gold in Dease Lake, Cassiar, in considerable quantities and also in the Tulameen District, in which latter district it also has been found in place.

This, however, is not the only object of the visit of the party referred to, it being understood that they will inspect several propositions in the Cariboo District with a view to their development.

Convention at Revelstoke.

The international mining convention of the Pacific Northwest will be held in July of this year at Revelstoke, B.C. The convention is to be held in the open air, the scene being a beautiful park situated a short distance outside the town. If weather permits, the banquet, which is a feature of the assembly, will take place on the same grounds, the menu being wholesome, but strictly within the limits of the Canadian Food Board and cooked over open fires in typical prospector fashion. It will be attended by representatives of the mining Provinces and States of the Northwest.

Will Develop Fiddler Claims.

At least \$150,000 will be spent on the development of the Fiddler group of mineral claims situated near Dorreen, B.C., in the Skeena Mining Division, Northern British Columbia, a considerable proportion of which will be expended this year. It is understood that the Oppenheimer interests of Butte, Mont., are advancing the capital for this purpose and it is confidently expected that the property will be placed on the shipping list soon. It is situated in the neighborhood of the Rocher de Boule. The ore contents are chiefly gold.

Exhibits of Rare Minerals.

For the further encouragement and instruction of the prospectors of British Columbia, and also in order to induce the location and development of the rarer minerals in the Province, Hon. Wm. Sloan, Minister of Mines, has authorized the Mining Engineers of the Department of Mines to secure complete exhibits of these rarer metals and arrange for their display in the centres of the six mineral survey districts into which British Columbia has been divided. It is the Minister's opinion that one of the reasons that comparatively little is known of the resources of Western Canada in respect of the rare minerals, the usefulness and value of which have been emphasized by the demands of the war, is that the prospectors are not fully conversant with their characteristics. Therefore he believes that with specimens on public exhibit, and engineers competent to give visitors the knowledge which, perhaps, they lack, it will be found that the Province possesses mineral riches which, up to the present, have not been brought to light. The first of these exhibitions has been opened by Mr. R. W. Thomson, M.E., at Kamloops, B.C., There will be others at Nanaimo, Prince Rupert, Hazelton, Revelstoke, and Grand Forks.

Will Use Powdered Coal.

The use of powdered coal to replace fuel oil is the subject of experiment in British Columbia at the present time. In Vancouver City the B.C. Sugar Refining Co., one of the largest of the Provincial industries, has installed a plant to provide for the change and, it is understood, is getting satisfactory results. The Canadian Collieries (Dunsmuir) Ltd., anticipating a demand for the new fuel, is making tests of waste from its washery which has been accumulating for years in the harbor

at Ladysmith, B.C. If the results prove what is expected the Company will install special equipment for pulverizing and will proceed with the reclaiming of this coal refuse, of which there must be four or five million tons and some of which has been lying under water for seventeen years. It is considered probable that, should the experiments now under way turn out right, and providing the United States withdraws the "tankers" at present in service between California and British Columbia, the Canadian Pacific Railway Co. will arrange for the use of coal dust in locomotives now burning oil.

An interesting side-light on the increased value of coal in the Canadian Northwest is obtained from an experience of the Pacific Coast Coal Mines Co. In pre-war days the company discharged its waste into a lagoon, across which a rough cofferdam had been constructed. Mr. George Wilkinson, then manager of the company's operations and now Inspector of Mines for British Columbia, was responsible for this and his idea was that this coal, for which there then was no market, might prove useful in an emergency. Last year some 50,000 tons of it were recovered and placed on the market at \$3 a ton.

Canadian Western Fuel Co.

A new company, known as the Canadian Western Fuel Company, has been incorporated in British Columbia for the purpose of purchasing, taking over and operating all the assets in British Columbia of the old Western Fuel Company, of San Francisco, Cal. The incorporators of the new company are Messrs. G. W. B. Owen, J. B. Owen and John Hunt, and the capital is \$5,000,000. There will be no change in the management of the company as at present constituted and its headquarters will be at Nanaimo, B.C. Mr. G. W. B. Owen is the general manager and Mr. John Hunt remains the general superintendent. Mr. J. B. Owen is the manager of the Western Mercantile Company, the trading establishment opened by the Western Fuel Company when it was reorganized a year ago.

The purchase of the Vancouver Island properties of the Nanoose Collieries, Ltd., by the Nanoose Wellington Coal Company, has been announced. Mr. Lewis Williams, president of the purchasing company, has given a statement to the effect that it is the intention to push the development of the coal bearing areas controlled by the new concern to the end that the present output may be trebled.

AUCTION SALE of Valuable Graphite Property

Near Buckingham, Province of Quebec, Canada.

The undersigned will offer for sale by public auction at W. A. Cole's Auction Rooms, No. 63 Sparks Street, in the City of Ottawa, Canada, at 2.30 o'clock in the afternoon of the tenth day of September, 1918, the property known as the "Walker Graphite Mine," in the Township of Buckingham, comprising about 1250 acres of land, held in fee simple. The property is situated about six miles from the town of Buckingham, on the Canadian Pacific Railway, between Montreal and Ottawa, and less than ten miles from the landing on the Ottawa River. The quantity of ore is practically inexhaustible, and the mining facilities are exceptional.

The buildings consist of refinery, engine and boiler house, manager's dwelling, foreman's dwelling, and other buildings. The lands are well timbered and contain ample supplies for mine purposes and fuel. The right to cut basswood until the 1st day of March, 1919, has been sold.

A large quantity of machinery, plant and tools on the property will also be sold as a separate lot. Both sales will be subject to reserved bids.

Applications to inspect the property may be made to Mr. Sam. Devine, Buckingham, Quebec, Canada, and further particulars may be obtained from

M. J. GORMAN, Vendor's Solicitor,
 Union Bank Building,
 Ottawa, Canada.

Industrial Housing

QUICK SHIPMENT

A Train Load of ALADDIN Houses Per Day

Depending upon size of house, we load from one to three complete houses in each car. Normally, shipments arrive at Atlantic Coast points in about six days after leaving our mill.

QUICK RESULTS

A Gang of 120 Men Can Erect 10 ALADDIN 5-Room Houses Per Day

Aladdin Houses are Read-Cut. Every piece of material, joists, studs, rafters, sheathing, siding, flooring, interior finish, is cut to proper size, marked and numbered and ready to nail in place.

SERVICE PLUS

Immediate Action on Any City Project—or Any Housing Problem

Our plans are drawn, prepared and finished for cities of from 300 to 3,000 population. Experienced town planners, landscape architects, engineers and builders have spent months of study and work in their production. This service becomes a part of every Aladdin Housing transaction—a single house or a complete city.

Over One Thousand ALADDIN Houses Carried in Stock

All lumber, shingles, lath, millwork, siding, flooring, interior finish, plaster, hardware, paints, nails, are carried constantly in stock, ready for instant shipment.

Hundreds of American Corporations Have Built Aladdin Houses

As many as five hundred Aladdin houses have been sold to a single corporation. Re-orders are constantly received from corporations who have tested our houses by actual purchase and erection.

A Single House—or A Complete City

The Aladdin Company will quote you a definite price on a single house or complete cities of 300, 500, 600, 1,000, 1,500 and 3,000 population. These cities are now listed in our book on Industrial Houses. Cities include homes, stores, churches, schools, municipal buildings, water distributing systems, electric light plants and distribution, sewerage systems, trees, etc. "Book of Aladdin Homes" No. 331 with full information, floor plans and prices will be mailed on request. Aladdin book "Industrial Housing" mailed only to inquiries written on business or official stationery.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

Applicants for publications not listed above should mention the precise area concerning which information is desired.

Maps published within recent years may be had, printed on linen, at the nominal cost of ten cents each.

The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.

Communications should be addressed to The Director, Geological Survey, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

USERS of the Callow Cell are naturally interested in knowing how the decision of the United States Circuit Court of Appeals for the Third District, in the Miami case, will affect their interests.

As we understand the prevailing opinion of Judge Woolley in the Miami case he has interpreted the Supreme Court decision in the Hyde case as meaning that "*invention resides not alone in the critical proportion of oil, but also in air and agitation,*" and again, "*in the co-action of the critical proportion of oil and air effected by 'an agitation greater than, and different from that which had been resorted to before,' resulting in a froth concentrate of economical value,*" and further, that the Supreme Court did not limit the patent to "*agitation by mechanical means,*" but to agitation of a violent and persistent kind; "*it mixes the oil with the metal of the ore. This is old. Then, by its greater intensity and longer duration, it stirs the pulp into a froth.*"

Thus, this decision of the Third Circuit Court of Appeals has a most important bearing upon the art, because it holds that the mixing of the oil with the mineral is old, but it **leaves open the use of oil in connection with aeration-cells.** Meanwhile the idea of a "*critical*" proportion of oil has been is-

proved by practice in several mills within a short time after it was promulgated.

Judge Woolley says further, concerning the Callow Cell: "*Aeration is direct, and is not the result of or caused by agitation. On the contrary, agitation results from aeration and such agitation, though present in some measure, is not even approximately of the violence and duration of the agitation of the patent. The operation in the Callow Cell certainly possesses these distinguishing features from operation of the process where aeration is caused by agitation.*"

The Court further confirms this important dictum by saying: "*If the only agitation to which the pulp was subjected (after such agitation as in the prior art was necessary to mix the oil and ore) was the agitation of the Callow Cells, we would not say that that agitation amounted to or was the equivalent of the violent agitation of the patent disclosure and constituted infringement.*"

Apparently users of the Callow Cell may feel assured they do not infringe the method of agitation described in U.S. Patent No. 835,120 (less than 1% oil), No. 962,678 (soluble frothing agents), No. 1,099,699 (phenol or cresol in the cold without acid) since all three of the patents are of the same process, dependent upon a certain degree of violence and length of agitation and the production of the same characteristic froth, as set forth in their claims.

(Signed) J. M. Callow.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

THE CANADA METAL COMPANY, Limited

X

—drill-bits like these—

and shanks —clean, uniform, correctly made, will increase your drilling speed and cut down your steel and drill repair bills.

You can make these bits and shanks by the ALL-HAMMERING PROCESS in the SULLIVAN DRILL SHARPENER.

The Double-Arc Bit

marked by an "X" above, is a new Sullivan Bit, which is making a name for itself because of its remarkable cutting and reaming qualities. The "Double-Arc" holds its drilling speed and its mudding ability as the depth of the hole increases, in an unusual degree.

Automatic Variable Gauge Dies

are now available with Sullivan Sharpeners (see lower cut). You can make bits of 16 different gauges with one set of dies. The adjustment is by thumb-screw. It's a hammer—swaging action.

10 Convincing Facts About NEW CLEVELAND TYPE S POCKET-IN-HEAD STOPERS

1. Faster drilling.
2. Lower repair cost.
3. Drop forged parts throughout.
4. One diameter reversible piston.
5. Unbreakable valve and valve block.
6. Larger air ports than in any other stoper.
7. Greater valve surface, hence longer life.
8. Pocket-in-head reservoir.
9. Lower air consumption because of pocket-in-head.
10. SATISFACTION.

They explain some of the reasons why "New Cleveland" Pocket-in-head Stopers are successful.

CARBIDE LAMPS

ARE REAL DIFFERENT

The chief point of difference between this lamp and others is that it automatically rakes the carbide. It does for itself what the miner has to do for other lamps, only with this difference. The ITP lamp is raked at exactly the right moment and never vigorously—result—always the correct size flame and never any blowing due to excess pressure. Write us for a sample for free test. The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent, on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

TRANSPORTATION BUILDING
MONTREAL

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

Rolls vs. "One- Easy-Step"

No. 43 Marcy Mill with Cast Iron Drum Feeder

In the last few years there have been remarkable advancements in ore reducing methods.

For instance, there are two great plants treating the same ore with buildings the same dimensions.

One plant operates with a graded crushing scheme. It has been remodeled several times; finally reaching a capacity of 6,000 tons a day.

The other plant installed **Marcy Mills**—using the "One-Easy-Step" System. It treats 18,000 tons a day! The cost is low and the extraction high.

All this is evidence in the case of "Rolls vs. Marcy Mills."

Beyond doubt the roll is an efficient crusher—reducing from 3 in. to $\frac{1}{2}$ in.—but the operating costs of rolls for this duty will be found to be from 6c to 12c a ton.

If rolls are placed before Marcy Mills in crushing for Concentration or Flotation the capacity will be increased not more than possibly 10% and with the cost of operating the rolls, being at least one-third of the cost of operating Marcy Mills, there is no gain, but a net loss in using them, to obtain so comparatively small extra capacity.

The Marcy Mill "One-Easy Step" system is not only easier—it is cheaper.

MARCY MILL
CRUSHING
"ONE
EASY
STEP"

We will be glad to give you records of MARCY work in prominent operations. Write now for this data and other particulars.

KLIM
IN POWDER FORM

Use Every Bit—No Waste

For tea and coffee, and for all camp cooking and baking use Klim and eliminate all milk waste. Use Klim from the tin as required, a spoonful now, a cupful again, and you'll find that the last bit in the tin is as sweet and fresh as the first. Klim never spoils nor sours.

Klim is pasteurized, separated milk in powder form. **It's genuine—the flavor proves it.** Nothing has been removed but the water, and nothing whatever has been added—it's just the milk solids. Convenient to use, bulks small, light in weight, saves on freight charges, costs little—the form of milk best suited to your needs.

In 10 lb. tins, six to a case, from your supply house or direct.

THE CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO, July 1st, 1918.

No. 13

The Canadian Mining Journal

With which is incorporated the
"CANADIAN MINING REVIEW"

Devoted to Mining, Metallurgy and Allied Industries in Canada.

Published 1st and 15th of each month by the
MINES PUBLISHING CO., LIMITED

Head Office 263-5 Adelaide Street, West, Toronto
Branch Office 600 Read Bldg., Montreal

Editor: REGINALD E. HORE, B.A. (Toronto).

SUBSCRIPTIONS.

Payable in advance, \$2.00 a year of 24 numbers, including postage in Canada. In all other countries, including postage, \$3.00 a year.

Single copies of current issue, 15 cents. Single copies of other than current issue, 25 cents.

The Mines Publishing Co. aims to serve the mining industry of Canada by publication of reliable news and technical articles. This company publishes the Canadian Mining Journal twice a month and the Canadian Mining Manual once a year.

ADVERTISING COPY.

Advertising copy should reach the Toronto Office by the 8th for issues of the 15th of each month, and by the 23rd for the issues of the first of the following month. If proof is required, the copy should be sent so that the accepted proof will reach the Toronto Office by the above dates.

ADVERTISING.

The Canadian Mining Journal covers the Canadian mining field. Ask for advertising rates.

CIRCULATION.

"Entered as second-class matter, April 23rd, 1908, at the post office at Buffalo, N.Y., under the Act of Congress of March 3rd, 1879."

KEEP THE COAL CLEAN.

The Fuel Administration of the United States in enforcing its instructions regarding the proper preparation of coal. Six coal mines have been shut down for disregarding the clean coal regulations. Operators of many mines have been censured and warned to improve their methods. Good results are being obtained as a result of the regulations.

As the value of fuel is greatly depreciated by careless preparation, an increase in tonnage produced is worse than useless, if the increase is obtained by a corresponding increase in the percentage of waste in the coal shipped. "Keep the coal clean," should be the slogan of operators and miners alike.

Decrease in anthracite output in the United States in May was confined to grades used for domestic purposes, production of steam coal from culm banks having increased. Shortage of labor is said to be responsible for the decrease in freshly mined coal, inroads being made on labor by munition plants and other war indus-

BETTER WAGES AND MORE WORK.

Better wages and more work, seems to be the solution of the labor problem. There is no doubt that most miners could do more work per day if they wished to and if they considered that they were getting a fair share of the profits derived from their labor. At present high wages are being paid; but there seems to be good reason to doubt whether it will be possible to continue without serious readjustment after the war. It would be very unfortunate if it should be found necessary to lower the wages and it is well to look to other means for keeping down the cost of production.

The mineral resources of Canada will be more rapidly developed if we can make mining more profitable to all who are engaged in it. It is not enough that a few companies should be very successful. Every man who works in or about a mine or metallurgical plant should have an opportunity to earn a decent living and to acquire a reasonable portion of the things that will make him and his family happy and will enable his children to obtain a good education. He should be recognized as a very useful citizen who is contributing directly to the wealth of the nation by his labor. His living conditions should not be only satisfactory to himself, but such as to attract young men from other occupations. We believe that this would be possible to a very great degree if by mutual understanding it was agreed that he would exert himself to do more work. If miners could be induced to work reasonably hard for eight hours a day, they could very well be paid better wages than have been possible in the past.

With regard to this, Mr. Wm. Frecheville says: "With regard to cost (of production), the efficiency of labor plays a very important part. Probably most metal mine managers would agree with the view that their workmen could, without hurting themselves, accomplish more than they do. There is a general feeling that the men, even when working on contract, do not let themselves go to the extent that they might, the explanation being that they often fear that if they do more, and in consequence make a good thing out of their contract, the price would be cut or reduced for the next monthly contract, with the result that they would have to work harder for the same wage. There is the further fact that the present system does not seem to bring out any community of interest between the men and the mine, and we all know how better results can, as a rule, be got by anyone who is interested in the result and works with his head as well as with his hands. These difficulties exist no doubt in other industries, and in some perhaps to a greater extent than in the metal mining industry, and they probably constitute the principal industrial problem awaiting solution in the after-war days, when we hope many of the difficulties and

hand are the men holding back, and on the other side increased working costs, and opportunities of production are not being utilized to the full. To the writer it seems that probably the key to the situation lies in the fact that the men who do the work are not, perhaps, obtaining their fair share of the wealth they produce and of the good things that are going. Starting from that proposition it should not be beyond the bounds of human ingenuity to devise some way by which, in conceding higher wages, more strenuous and intelligent labor should be obtained."

Greater effort on the part of the miner is fortunately not the only way in which costs can be reduced; but unless the worker is willing and industrious, attempts to increase efficiency are sometimes disheartening. It is not uncommon for managers to encounter opposition when they introduce improved methods and machinery which would allow the miner to get more work done without increased effort. It would be well if the workmen could be made to understand that their co-operation in increasing efficiency makes it possible for their employers to pay better wages. One of the easiest ways to make them understand this is to promptly reward those who earn more. There is sometimes difficulty in doing this, but where it is possible, as is the case under the contract system, it is very illuminating.

It is not enough, however, that the miner should be induced to use improved methods and machines. He should be made to see that it is to his advantage to devise improvements himself. He should understand that while inefficiency on his part helps to keep down the wages of both himself and his fellow workers, the industrious and intelligent worker is helping to increase wages as well as the profits of those who have supplied the capital which makes it possible to carry on the work.

DEVELOPMENT OF THE MINERAL RESOURCES OF THE EMPIRE.

At a meeting of the Royal Society of Arts, held in London, in February, Wm. Frecheville read a paper on the development of the mineral resources of the British Empire. Mr. Frecheville is a distinguished mining engineer and copies of his paper which have recently reached Canada will be read with great interest here. Lines of action which would aid development are clearly pointed out in his paper. Metals for construction and money to pay our debts will be needed in very great quantities after the war and it is incumbent on us to provide for the more vigorous development of our natural resources.

"Looking at the Empire as a vast estate, large parts of which still await exploration and development, the first and obvious step would be to find out what we have. While encouraging exploration and prospecting by others, it is suggested that the estate owner should himself take some active steps in the matter, and by means of the examination of the country by skilled

coveries, the most likely ground for prospecting and generally the wisest policy to pursue to encourage the mining industry for the good of the community. In our Crown Colonies this should be done under the control of the Home Government. In other parts of the overseas Empire, the Governments of the great Dominions already give much attention to the development of their mineral resources; but the territories they administer are so huge there is ample scope for doing more if the means were available."

With regard to the great scope for expansion of the mining industry in Canada Mr. Frecheville says: "The mining centres are scattered through the known and prospected belt of country stretching from east to west, and the fact that they are absent on the little known and unprospected great northern country is in all probability not due to the non-existence of mineral deposits, but to their not having been found."

Referring to the difficulty of finding money in Canada to finance mining enterprises, Mr. Frecheville said that a very large copper deposit had recently been found in Manitoba, which had been proved to contain six or eight million tons of ore of a low grade, but which could be profitably worked on the huge scale on which Americans work their copper mines. \$5,000,000 is required to work this mine; \$2,500,000 for a railway and \$2,500,000 for a plant; but Canadians cannot provide the money. The Government was being asked to do a good deal and if they rose to the occasion they might do it. The South African Government is now offering mining areas on the Far Eastern Rand to tender, the Government taking a share of the profits on a sliding scale. Mr. Frecheville suggested that other parts of the Empire might well adopt the system.

GOLD IS NEEDED.

Since the selling price of gold remains fixed and the cost of mining and treating the ore has naturally risen during the war, it must be obvious that the present is not the most profitable time to mine gold. Anyone who imagines otherwise should consult the recent records of gold mining companies.

Since gold is not directly used in the manufacture of munitions, it is not surprising that a considerable portion of the public may be of the opinion that the war could be carried on just as well if the gold mines were closed down, and the miners employed on work that is commonly recognized as essential. As was pointed out by Mr. Hennen Jennings in an article recently published in the "Journal," the production of gold is necessary and every effort should be made to encourage it. With the public indifferent, we must depend upon the leading ability of governments. It is of interest to note that at least one leader in the United States government has strong views on the advisability of encouraging gold production. A Boston newspaper quotes Secretary McAdoo as saying:

"I fully appreciate that with rising cost of raw material and labor, and with a fixed value for their out-

ties. I should be sorry, however, if for this reason there were any relaxation in the effort to produce gold. At no time has this country so much required the largest possible production of gold as at the present. Next to food and ammunition, gold is one of the most needed war essentials. The man or the community that maintains or increases the production of gold in the face of difficulty and discouragement is performing a patriotic service no less than the more obvious, but not more useful, services that are more in the public eye."

THE COAL SITUATION IN WESTERN CANADA.

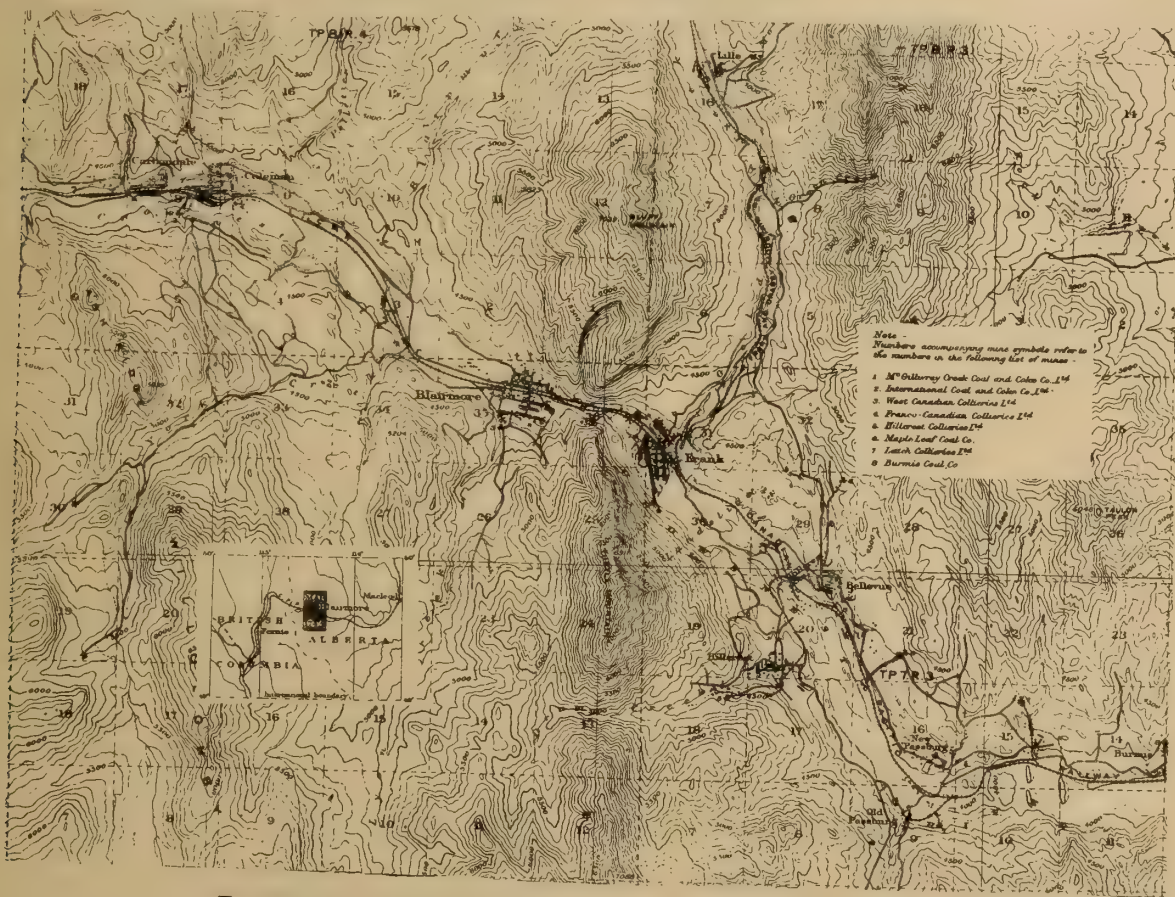

Mr. Grant Hall, vice-president of the Canadian Pacific Railway Co., has issued the following statement in regard to the coal situation in Western Canada:

"The fuel controllers say that the prospects for a supply of anthracite coal is no different from a few

tiful; when there was no abnormal demand for it for extraordinary uses; when there was no doubt of the supply from the United States. Now all precedents have been wiped out and I think the people owe it to themselves to seriously consider the situation and get in their supply, thus relieving the tension on railways and mine owners, but most of all on themselves."

THE BLAIRMORE COAL AREA, ALBERTA.

Alberta possesses by far the most extensive coal areas of any province of Canada—in fact, the greater part of the south-eastern section of the province seems to be underlain by coal. D. B. Dowling has estimated the known and mineable coal areas at not less than 30,000 square miles. On the eastern slopes of the Rocky Mountains the coals vary in character from bituminous coking and non-coking coals to anthracite. There is comparatively little anthracite; but much good bituminous coal.

The Blairmore Coal Area, Crownsnest District, Western Alberta

months ago and with this in view it seems to me imperative that consumers of coal should heed the warning. Speaking strictly from a railway point of view I would like to remind the people that prospects are very good, taking the time of year into consideration, for a good crop and you know how important it is that the crop be moved on time. Even a normal grain crop takes all the men and equipment that can be mustered when men are plentiful and with the scarcity that now exists it can easily be computed how impossible it will be to move both grain and coal in the same direction and give satisfaction to both.

"There have been times in the past when this company has helped out the domestic coal situation in the West by allowing dealers and others in time of severe weather to use from our stocks on hand, but I would like to remind all concerned that such action was in the days when coal was what one might well call a

The Geological Survey, Ottawa, has just published a topographical map of the Blairmore area. We reproduce part of it on this page on a much reduced scale. The location of the area near the Alberta-British Columbia boundary is shown on the small inserted map at the left.

This area is part of the Crownsnest Pass coal area, part of which is in British Columbia. It is generally referred to as the Crownsnest Pass District, Alberta. The mines operating here produced during 1917, 1,193,313 tons of coal. Mr. John Stirling, chief inspector of mines of Alberta, says that if these mines had been in operation fairly steadily, without increasing the present amount of development or men employed, the output might have been 1,779,888. If Western Canada needs coal, this area can supply much larger quantities than the

Copper Mining and Refining in British Columbia

By E. JACOBS.

It will be remembered that about three years ago there was appointed by the Minister of Militia and Defence "a Commission to Investigate the Feasibility of Refining Copper and Producing Metallic Zinc on a Commercial Scale in the Dominion of Canada." The members of that commission were: Hon. Lt.-Col. David Carnegie, M. Inst., C.E., Chairman, Ordnance Advisor to Shell Committee; Dr. Alfred W. G. Wilson, Chief of Metal Division, Mines Branch of Canada Department of Mines, Ottawa, and Dr. A. Stansfield, Professor of Metallurgy, McGill University, Montreal. The Commission was formed after several conferences, concerning the supply of copper and zinc for the British War Office contracts, with the Minister of Militia and Defence, General Hughes; the Chairman of the Shell Committee, Brig.-General Bertram; Mr. David Carnegie, Ordnance Advisor, and finally with Sir Robert Borden, the Prime Minister. The investigations of the commission covered a period from March to August, 1915. In 1916 the Imperial Munitions Board, Ottawa, with the approval of the Minister of Militia and Defence, authorized the publication of the report which was the outcome of the investigations of the commission and which, as stated by its chairman, included "information of value to many in the Dominion, as it contained the mature opinions of the most expert men in Canada on the subjects dealt with."

It is thought probable that, leaving out for the present the subject of the production of metallic zinc, which, by the way was successfully established at Trail, B.C., on a commercial scale before that of refined copper was also undertaken there, a general review of the situation in regard to the production of copper in British Columbia, keeping in mind the opinions expressed during the time the investigations were made, will be of interest. No reference will be made to the production of copper in Ontario, though this is of important and increasingly large proportions, for the reason that in its preliminary conclusions the commission, after having expressed its opinion that the time was opportune to commence refining copper in Canada, favored Trail, B.C., as "the best location where to begin." It may be well to quote from the report of the commission its preliminary conclusions, as under:

"Preliminary Conclusions Regarding the Refining of Copper in Canada.

"(1) We are of opinion that the time is opportune to commence refining copper in Canada.

"(2) The best location where to begin refining copper is, in our opinion, at the works of the Consolidated Mining and Smelting Company of Canada, Trail, B.C., because:

"(a) The works are owned and operated by Canadian capital.

"(b) The company is free to commence refining copper immediately, as it has no binding contracts with companies in the United States, such as exist for at least two years between the copper producers at the coast and the refineries in the United States.

"(c) The companies at the coast are all controlled by firms in the United States.

"(d) The Consolidated Mining and Smelting Company of Canada now possesses an efficient staff

"(e) As the electrolytic refining of lead has been carried on successfully at Trail for some years past the company is in a more favorable position to produce electrolytic copper more economically and at less initial cost of plant than any of the companies on the coast.

"(f) The establishment of a refinery at Trail would in no way interfere with the subsequent establishment of a refinery at the coast, should this be found advisable.

"Advantages of Refining Copper in Canada:

"(1) The establishment of a copper refinery in Canada means the beginning of a new industry, which will lead to the manufacture of copper products now imported from the United States and elsewhere, such as wire, bars, sheets, tubes, etc.

"(2) It means that the money value of the labor now enjoyed by the United States, in manufacturing the imported products, could be kept within the Dominion. The value of the imported products is upward of \$5,000,000 annually. This amount does not include the value of brass imported.

"(3) It means that as approximately one-third of the value of the copper produced in the Dominion now goes to the United States to pay the cost of refining, freight, and marketing, that amount would be saved to the Dominion.

"Note.—It costs from 8c to 11c per lb. to produce the finished product—ingot copper ready for the manufacturers—from copper ore in the mine. The market price of copper usually varies from 12c per lb. upward.)

"Copper Available.—Dr. Wilson estimates that there is more than 1,000,000,000 lb. of copper available in the known ore deposits of British Columbia, most of which will be mined in all probability during the next 15 years. The undeveloped resources cannot be estimated.

"Total Copper Mined Annually.—The total copper mined and partially manufactured in Canada is about 75,000,000 lb. annually. This will be increased probably to 100,000,000 lbs. within two years.

"The total copper mined and partially manufactured in British Columbia is about 45,000,000 lbs. annually. This, too, will be increased within the next two years."

It is of interest to note that Dr. Wilson's prediction as to an increase in the production of copper has been amply realized. The output of copper in the Dominion and British Columbia, respectively, during the last three years is shown in the following table:

Year.	Whole of Canada.		British Columbia.	
	Lb.		Lb.	
1915	100,785,150		56,692,988	
1916	117,150,028		63,642,550	
1917 (estimated)	108,860,358		57,717,535	

(Note.—The foregoing figures are those of the Dominion Statistician, who obtains actual production of metallic copper.)

British Columbia Copper Producers.

The larger producers of copper from mines in British Columbia are the Granby Consolidated Mining, Smelting & Power Co., Ltd., operating in both the Boundary and Coast districts; the Britannia Mining and Smelting Co., Ltd., in the Coast district; the Canada Copper Corporation, Ltd., (formerly the British Columbia Copper

Co., Ltd.), in Boundary district, and the Consolidated Mining and Smelting Company of Canada, Ltd., in Rossland camp, Trail mining division. For a number of years the Boundary district produced more copper than any other in Canada, but in quite recent years its output has fallen off considerably while that of the Coast district of British Columbia has increased until now the latter is a long way in the lead in the province, with every indication of making further increase, while the Boundary district is showing a steadily diminishing production. In fact there does not seem to be a reasonable prospect of any early large increase in the production from interior district mines, not at any rate until the Canada Copper Corporation shall be making a considerable output of ore from its big mine on Copper Mountain, in Similkameen district, which may not be before the close of next year.

Three Principal Producing Districts.

Reverting to the report of the commission, Dr. Wilson's "Report on the Possibility of Producing Refined Copper in Canada," dealt first with the copper resources of the Dominion, and in this connection he mentioned three principal producing districts, namely (a) Kootenays, (b) Boundary, and (c) Coast. The situation to-day is different, in that the output of copper from mines in Kootenay and Boundary districts may be expected to be smaller in 1918 than in any year since it attained to considerable proportions in these districts. The chief reasons for this are that the Consolidated Company has quite lately very much reduced, if not entirely discontinued for the time being, production of ore at its mines in Rossland camp, in West Kootenay, while in Boundary district the smelting works of the Granby Co. and the Canada Copper Corporation, respectively, are not operating at full capacity, nor does the ore these companies are now mining contain as high an average of copper as that of a few years ago from the same mines. With only one company in Rossland camp now maintaining its normal production, namely, the Le Roi No. 2, Ltd., operating the Josie group of mines, from which an output of between 500,000 and 700,000 lb. of copper may be expected this year, with little copper ore being mined in Nelson mining division this year; with decreased tonnage and a smaller copper content in ore from Boundary mines, and with the Iron Mask, near Kamloops, being the only other mine worth mentioning among the smaller producers of copper in the interior districts, it seems evident that there must be expected a serious falling off in the output of copper from these districts this year.

As to the Coast district—there does not appear to be good reason to look for any appreciably large increase in output except the Granby Company shall make it. The Britannia Company is reported to have decided not to continue the policy of considerable expansion of operations planned earlier. So far as known, there is little promise of much production from smaller mines, neither in Howe Sound region nor on Texada and Vancouver Islands. Progress is reported from two mines in Sooke district, Vancouver Island, but their output cannot be large until much more ore shall have been developed. In Quatsino division of Vancouver Island, the Coast Copper Co., controlled by the Consolidated Mining and Smelting Co., has done much development work, but until a railway shall have been constructed to provide transportation facilities and arrangements made for reduction of the ore, no production of copper can be expected from that source. Neither is there assurance of much improvement soon

as regards copper mining properties on Moresby Island of the Queen Charlotte group, nor of any other part of the upper Coast district, except it be in the district about Observatory inlet outside of the parts controlled by the Granby Co. In Omineca division, in camps within reach of the Grand Trunk Pacific railway, there are copper properties, but the only one yet sufficiently developed to make a production of more than an occasional small shipment is the Rocher de Boule Copper Co.'s mine, which has already attained to a production of between 1,000,000 and 2,000,000 lb. of copper in a year.

More Specific Information.

The general situation to-day in regard to the production of copper in British Columbia having been outlined it may be desirable that more specific information be given in regard to the chief producing districts.

Kootenay.—Dr. Wilson stated in his report, concerning the Kootenays, that in 1914 Rossland made a production of 3,779,830 lb. of copper and Nelson 586,764 lb., together 4,366,594 lb. He added: "These are both tributary to the smeltery of the Consolidated Mining and Smelting Company of Canada (C.P.R.) at Trail. The Rossland ores are essentially gold ores; they, however, contain a small amount of copper in the form of a sulphide, not much more than one-half of one per cent., but sufficient to make it feasible to recover the gold by the methods of the copper smelter."

On May 3 "The Trail News" published the following: "One of the contributing causes of heavily curtailing gold-copper ore shipments from Rossland mines yesterday was the heavy mine taxes imposed by the Provincial Government. This, together with the heavy increase in cost of powder and everything else pertaining to mining—and the further fact that Rossland ores contain but a few pounds of copper to the ton, being most in gold value, is understood to have impelled the Consolidated Co. to lay off most of the miners employed in its Rossland mines. A few will be kept at development, and some shipments of ore will possibly be made—enough, perhaps, to keep one copper furnace at the company's smeltery at Trail in operation, together with the shipments of high-grade copper ore that are being received here from various custom sources, thus also keeping the copper refinery in operation. . . . At the Trail smeltery, all the copper furnaces but one have been blown out." The notice issued at Rossland by the Consolidated Co. reads as follows: "Large increases in the various items entering into the mining and smelting of Rossland ores, such as wages, cost of explosives, coke, steel, general mine and smeltery supplies, without adequate compensation in value by way of increased metal prices, coupled with increased taxation, has made it necessary for the company to suspend shipments from its Rossland mines indefinitely. An endeavor will be made to keep a small force on development work, and to place the remainder of the company's Rossland employees at the smeltery, the Sullivan mine, Kimberley, and other lead-silver properties of the company." It will thus be seen that the production of copper in the Kootenay districts is likely to be very small this year, with only one of the five copper blast furnaces at Trail being operated.

Boundary.—As to the Boundary district—in the Mines Handbook for 1918, it is stated concerning Granby Co.'s mines, that "Ore now being mined at Phoenix yields slightly less than 15 lb. copper and about 84c gold and silver per ton. . . . On the Gold Drop only 80,000 tons of ore remains to be extracted, and the Snowshoe, Curlew, and Monarch claims are almost worked out.

Practically all reserve tonnage is in the Ironsides." District newspaper statements are to the effect that only four of the eight blast furnaces at Grand Forks are being regularly operated. Ore reserves in the Granby mines in Phoenix camp were estimated to be about 3,576,000 tons as at June 30, 1917. Total blast-furnace capacity at the Granby smelter at Grand Forks is stated to be 1,440,000 tons of ore per annum. There are three electrically-operated converter stands with ten 84 x 126 in. shells of barrel type; product is blister copper of 98.5 per cent. tenor, containing an average of 18 oz. silver and 4 oz. gold per ton.

The decreasing production of the British Columbia Copper Co., now the Canada Copper Corporation, is indicated by the following yearly output figures: In 1912, 11,146,811 lb. copper; in 1913, 8,296,902 lb.; 1914 and 1915 were broken years, with small production; in 1916, 5,196,239 lb. Figures for 1917 are not at hand. It will be seen that production in 1916 was less than one-half of that in 1912. Weed refers to the company's Mother Lode mine as being "now nearly exhausted," and adds, "It was only possible to operate the smelter profitably because of the high price of copper." The company has, however, in its Lone Star property, situate just across the International Boundary line, in the State of Washington, approximately 300,000 tons of ore developed by drilling and other work, of which quantity it is stated that in April, 1916, 170,000 tons of 1.60% copper constituted the ore reserves. Comment made is: "Average assay value of Lone Star ore is higher than that of other Boundary district ores, but ore is silicious and as it contains alumina as well it is much more refractory. Most of the Lone Star ground is still unprospected." The Canada Copper Corporation's smelter at Greenwood has three blast-furnaces, total capacity more than 2,000 tons of ore a day, but all are not in regular operation. In the converter-house there are two stands with 84 x 126 in. shells taking matte with from 25 to 55% copper and producing blister of 99 to 99.5% copper, containing 20 to 50 oz. silver and 5 to 10 oz. gold per ton.

Similkameen.—In strong and favorable contrast to the situation at the Canada Copper Corporation's Mother Lode property near Greenwood, is that at its Copper Mountain mine, near Princeton, Similkameen district. Weed states that the ore reserves here are estimated at 10,000,000 tons developed ore and 2,000,000 tons probable ore; assay value, 1.74% copper and approximately 35c a ton in gold and silver. "Careful geological study suggests the possibility of eventually doubling the present tonnage of assured ore." A published estimate of future operations is that with treatment of 1,000,000 tons per annum, a yearly output of 27,400,000 lb. of copper will be made. The life of the property, based on present ore reserves, is estimated at twelve years. A contract has been let for the construction of a railway about 13 miles in length from Princeton, and completion by the middle of 1919 is expected. Meanwhile, the erection and equipment of a 3,000-tons a day concentrating mill is to be proceeded with. Concentration will include the flotation process, a 40-ton experimental mill having satisfactorily demonstrated its suitability to Copper Mountain ore.

Coast.—Information supplied to Dr. Wilson was in effect that normal production of the Britannia mines, in Vancouver mining division, was 15,000,000 to 18,000,000 lb. of copper per annum and that when work under way in 1915 should be completed, production would be about 25,000 lb. per annum. It is probable

that the higher output has now been reached, but no official information to this effect has been received for use in this review. Higher costs of labor and materials, aggravated by increased Provincial Government taxation, are reported to have influenced the management of the Britannia Co. in the direction of curtailing the intended expansion of operations. Ore reserves were estimated to have been at the beginning of last year as follows:

Broken ore in stopes	919,322 tons, aver. 3.08% copper
Total ore developed	6,462,780 tons
Probable ore	6,756,350 tons
Possible ore	4,616,050 tons

Total 18,754,502 tons, aver. 1.97% copper

The Britannia ships selected ore and concentrate to the smelting works near Tacoma, Puget Sound, Washington. Figures for 1917 have not been received, but for 1916 they were: Product shipped, 55,186 dry tons. Average assay: Gold, 0.014 oz.; silver, 1.67 oz. to the ton; copper, 14.76%; zinc, 3.22%.

There is little to add to what has already been stated relative to the smaller mines in the lower Coast district, except that the normal production of the Marble Bay mine, on Texada island, is about 1,000,000 lb. of copper a year, though in some recent years its output has not reached that quantity. The ore is sent to the Tacoma smelter.

While there is nothing very important to state concerning copper mining on Vancouver Island, it may be of interest to mention that the Tyee smelter at Ladysmith, recently purchased by the Ladysmith Smelting Corporation, has two blast-furnaces, one 42 x 120 in. 200 tons, and one 48 x 160 in., 300 tons daily capacity. It has not yet been found practicable, though, by the present owners, to obtain sufficient ore to admit of operating except but for short periods, intermittently.

Progress in Copper Refining.

Colonel Carnegie was gracious enough to inform the Minister of Militia and Defence that the report of the commission of which he was chairman "contains the mature opinions of the most expert men in Canada on the subjects dealt with." As, however, a considerable proportion of those who busied themselves in gathering information for the benefit of the commission were laymen with but little knowledge of the subject of copper refining, it is not surprising to now find that their "mature opinions" have not since been realized. Even some of those who might have been fairly expected to be nearer facts in their forecast proved to be not entirely dependable. For instance, one well-known man, general manager for a large mining and smelting company, replying in January, 1915, to an inquiry from the mining committee of the Vancouver Board of Trade, is quoted in the report of the commission as having given reasons not favorable to the establishment of a copper refinery in British Columbia, closing his letter as follows: "For these reasons I am of the opinion that it is premature to consider the question at the present time." And yet before the close of the following year the Consolidated Mining and Smelting Co. had undertaken to carry into effect the establishment of an electrolytic copper refinery, and has since operated it successfully. There is an old adage which seems to have been lost sight of, namely, "never prophesy unless you know."

The production of electrolytically refined copper at Trail is now no longer a novelty, but is regarded as an ordinary part of the accomplishments of the metallur-

gical staff of the Consolidated Mining and Smelting Company, just as has for years been the production of refined lead, silver, and gold, and latterly, that of electrolytic zinc. Thus it has proved the practicability of establishing the industry of copper refining in British Columbia. Its own supply of blister copper has been augmented by the addition of that made at the smelting works of the Canada Copper Corporation at Greenwood, but there does not appear to be a present prospect of the output of the Granby Co. from its Grand Forks smeltery being also obtained. The outlook for a much larger supply from interior districts, therefore, so far as known to the public, does not just now seem to be favorable. The Granby Co. will no doubt continue for some time to come to ship its blister copper from its Grand Forks Smeltery to the refinery of the Nichols Copper Co. of New York, with which it has a contract.

Nor does there seem to be good reason to look for the establishment of a copper refinery on the coast of British Columbia in the near future, unless it shall be undertaken by the Granby Co., for outside of the copper production of that company and the Britannia Mining and Smelting Co. there is not likely to be any considerable quantity of copper available for refining purposes after allowing that the last mentioned company is under contract to ship to the Tacoma smeltery which already has its own copper refinery established, for four or five years longer. It may be that sources of copper supply not at present known to the writer may a little later become available, but there does not at the present time seem to be grounds for any other conclusion than that there is no warrant for expecting the copper refining industry to be established on the Pacific coast of Canada in the near future, unless it be by the Granby Consolidated Mining, Smelting and Power Co. in connection with its big smelting works at Anyox, Observatory Inlet, B.C.

CANADIAN COLLIERIES.

Mr. Henry S. Fleming, Chairman of the Executive of the Canadian Collieries (Dunsmuir), Ltd., who recently visited Victoria, B.C., deprecated criticism which has been leveled against the Dominion Government for the disallowance of the Settlers Rights Amendment Act, 1917, declaring that the legislation was confiscatory, and that its effect would have been to give settlers coal lands on the security of which the company had raised and invested \$16,000,000 on Vancouver Island. He said that the company gave \$11,000,000 to the E. & N. Railway Company for the coal lands and mines and since had put \$5,000,000 into development. This money had been raised in Great Britain and United States financial centres and any legislative interference with the property thus mortgaged would result in shaking confidence in British Columbia securities.

CAN EXPORT MANGANESE ORE.

Permission has been secured from the Dominion Government for the export from Canada to the United States of 5,000 tons of manganese ore. Hon. Wm. Sloan, Minister of Mines, of British Columbia, has been advised of this action by Ottawa. The license applies particularly to the Curle property, near Kaslo, B.C., which has been opened recently and already has a considerable quantity of the mineral ready for shipment.

The Canadian Consolidated Mining & Smelting Co. is said to have acquired under bond a fluorspar property situated about 20 miles north of Grand Forks, B.C.

GOLD SHIPPED FROM REX MINE, MANITOBA.

The Pas, Man., June 14.—The first shipment of gold from the Rex mine, which is being developed by the Mines Exploration Syndicate, of which Makeever Bros. are the managers, left here last Monday in care of the Bank of Commerce for the mint at Ottawa. It consisted of 300 ounces, valued at \$6,000, and was the result of the mill's first month's run.

Walter Neal, the engineer in charge of the property, is to be congratulated on having got the mill in operation in the short space of time of 18 months, and having overcome many obstacles in the prosecution of the work incidental to the developing of a property where the means of transportation were so difficult to overcome.

Makeever Bros. have pushed work ahead on the Rex property energetically, and the development of the district will be greatly stimulated by their efforts. This enterprising firm, through its representative, Walter Neal, has now taken over the management of the Northern Manitoba Mining and Development Co.'s property, just south of the Rex at Herb lake. A crew of men are already at work, in charge of Archie Close as foreman. They are enlarging the shaft to two compartments and retimbering. As soon as this is done sinking will be resumed and work pushed with energy.

Returns for a shipment of six tons of ore from the N.M.M. & D. Co. property, just received from Trail, B.C., show a value of \$103.10 per ton in gold.

Application has been made to the Lieutenant-Governor for power to increase the capital stock of the Northern Manitoba Mining & Development Company, Limited, from \$250,000 to \$1,000,000, such increase to be divided into 750,000 shares of \$1.00 each.

ANOTHER GOLD DISCOVERY AT HERB LAKE.

The Pas, Man.—A sensational discovery of gold has been made by Paul Gasse, who located several claims on a dyke situated at the north end of Herb Lake, and which he has traced about 4,500 feet. It shows a width of from 50 to 100 feet and pans gold freely. Samples show an assay value of \$9.00.

In addition to the large dyke, about half a dozen veins of widths varying from 6 to 24 inches have been found. These are all heavily mineralized. All these finds have been made in the granite or gneiss formations at the north end of the lake, which have hitherto been shunned by prospectors as being of little use. About thirty claims have been staked around the original discovery. Amongst the lucky ones are Edgar Stuart, W. S. Brady, Marshall Ballard, O. Badger, Julian Campbell, Mike Hackett and others. Apex Extension claim, owned by J. C. Little, of this town, and Bob Hassett, well known prospector and ex-army man adjoins the new find.—The Pas Herald.

SHIPPING COPPER ORE FROM THE PAS.

The Pas, Man., June 14.—The Ross Navigation Company is having great difficulty in navigating the Big Stone rapids and waters of Cumberland lake, and the ore from the Mandy mine is very slow in coming down so far. But, as the water should now start rising, it is expected that in the course of a few days shipments will come through regularly. The C. N. R. spur is now completed, and everything in readiness to handle the barge loads of ore as they arrive.

Two cars of ore were sent out by C. N. R. on Monday last to the Consolidated Mining & Smelting Co. at Trail, B.C., and the shipments will be continued until the 8,600 tons at Sturgeon Landing have been cleaned up.

WHO OWNS THE COAL ?

The action of the Dominion Government in disallowing the British Columbia Provincial Government's Statute of 1917, known as the Settlers' Rights Amendment Act, has created a furor in British Columbia, because it has the effect of nullifying the claim of early settlers on what is known as the Esquimalt & Nanaimo Railway Co.'s land belt to the coal rights within that section of Vancouver Island, an area of 3,296 sq. miles, and because it confirms the title of the Canadian Collieries, Ltd., to the greater part of this coal. Interest is strengthened owing to the fact that the Granby Consolidated Mining & Smelting Co. purchased from settlers, who had obtained title under the Provincial statute, since vetoed by the Canadian Government, two blocks of coal land, which it has been engaged in developing and on which already it has spent about \$300,000. The company, therefore, finds itself in the position of having made a very considerable investment on property, the title to which, to put it mildly, is questioned. The importance of the issue may be better appreciated when it is stated that in a report made by Mr. B. D. Dowling, of the Canadian Geological Department, in 1915, the actual reserve of bituminous coal within this tract of land was placed at 1,060,000,000 tons.

Without going into the history of the controversy, as between the E. & N. railway company and the settlers, which extends over half a century and is somewhat intricate, it may be explained that the company came into possession of this block of land in 1884 as a subsidy for the construction of the railroad. The Government of British Columbia, anticipating the granting of such a subsidy, had reserved these lands in 1873, two years after the province became a part of the Canadian Confederation. Between 1873 and 1884 quite a number of settlers took up parts of these lands, in spite of the reserve which they claimed, and still claim, was not good in so far as it applied to the undersurface, or coal and other mineral rights. When the company got the block, it also was specified that it should have "all coal, coal oil, ores, stones, clay, marble, slate, mines, minerals and substances whatsoever thereupon, therein and thereunder." Thus there developed a direct issue between the early settlers and the railway company which became particularly acrimonious when it became clear that the coal resources were rich and extensive. In 1904, the British Columbia Government recognized the property rights of the settlers by giving them a year in which to record their claims. Many availing themselves of the opportunity, got provincial title to the coal, which the railway company fought through the courts and in Ottawa, without success. Finally, the company agreed to leave the settlers in peace on the Provincial Government giving 20,000 acres of other public lands in lieu of that alienated. Then it was represented by many other landowners that, not understanding the position, they had failed to make their application, and that it was not just to them that their claims, which were sound, should be disregarded. Consequently, in 1917, the present British Columbia Government passed the Act, since disallowed, which gave a further period for the registration of applications to coal rights in the belt. The gates thus thrown open, 179 applications were made, covering, according to a statement issued by the company, 33,000 acres, about 90 per cent. of which refer to coal lands, and the "greater part of which, it is believed, contain coal

seams of commercial value." Some of these were investigated by the Provincial Government and a number allowed, and it is the latter which the Granby Consolidated Mining & Smelting Co. purchased and to which reference has been made.

One of the strong arguments of the Canadian Collieries (D) Co., in its petition for disallowance, was that, having purchased property, and mines, and the greater part of its coal rights from the E. & N. Company, it had pledged it as security in the issuance of a bond issue of £2,054,800 and in the sale of preference shares to the value of \$5,000,000. It was maintained, therefore, that any legislation which permitted the estrangement of any part of this property would have the effect of damaging the credit of British Columbia in the money markets of the world.

Development of Coal Properties by Granby Company.

In view of the position in which the Granby Consolidated Mining & Smelting Co. finds itself through the Dominion Government's attitude on the settlers' rights issue, it is interesting to show what it has done on the coal lands, the title to which now seems doubtful. A standard gauge railway has been built into the mine site, a distance of a mile, and part of it has been laid through sandstone rock, necessitating heavy cuts at places. At the end of the spur, the necessary grading for the different tracks at the mine yard is completed and some of the tracks are laid. A temporary tippie has been constructed at the mine yard, a little to one side of where the main tippie will be erected, and all preparations are made for the shipment of coal at any moment. Some seven hundred tons is lying at the mine mouth for shipment. Fifty acres of land have been cleared and graded for mine buildings and dwellings to accommodate employees. Nineteen substantial dwelling-houses are under construction and almost completed and foundations are in for a large number of permanent mine buildings, including office, mess house, store, lamp house, etc. A good substantial saw-mill has been erected capable of turning out 12,000 feet per day. A large brick smokestack and foundations for two 250-h.p. boilers have been completed and two sterling water tube boilers are on the ground ready for installation. Three slopes are in course of being driven for. The slope for the manway is now down a distance of 196 feet, and at the face, the coal is 11 feet in thickness and of good quality. At a point 175 feet down, a level has been driven to the right at right angles to the line of the slopes, and places are being driven back from the level to connect with the other two slopes which are being driven from the surface. This level has been driven in a seam which averages 11 feet in thickness, so that it may be said that all three slopes have 11 feet of coal at the faces. \$300,000 has been spent to date on this development and the mine will be ready to ship 300 tons a day within two months and by the end of the year should be producing 700 to 800 tons daily. When the investment at the mines is added to that at Anyox, the company's smelter centre, where by-product coke ovens are being installed, it will total in the neighborhood of \$1,000,000.

Extensive development work is being done at the Florence silver mine, according to F. R. Wolfle, manager and principal owner of the property. The mill has been operating since March 10 with one shift of men and on May 12 two shifts were put on. There are 60 men employed at the mine and mill. Mr. Wolfle expects that later in the spring the number of employees will be greatly increased. The shipments of ore from the Florence for April amounted to 370 tons.

"Foghorn" Macdonald on Life in New York and London

The July number of "The American Magazine" features the story of Major Neil (Foghorn) Macdonald, who, at the age of 53, enlisted as a private in a machine gun company at Winnipeg in the early days of the war, and who has a distinguished record for service at the front. "Foghorn" has been well known in mining centres in Canada for many years, and he has been an outstanding figure in the Canadian army from the day he enlisted. The story which appears in the "American" will be read with much interest, especially by those who are fortunate enough to know him—and the number of these is great. Unfortunately, it is not permissible to print "Foghorn's" stories as he tells them, for he delights his audiences with the picturesque western language, of which he is a master. Neil is a fighter and no soldier knows better what he is fighting for.

"Foghorn" is an exponent of outdoor life, as will appear from the following reply to an interviewer's questions:

"I haven't got anything against New York. It's a nice enough village to stay in for about a week. But if you want to come up to the fifty-seven year mark with a relish for food or a fight, you want to live in the open. That's the way I've lived. I can ride and canoe and hunt and tramp. I got up early and worked like the devil. And I went to bed when I was through, and slept like a baby. I ate honest food and plenty of it—when I could get it. My meals weren't always on time, a few days late now and then. But they never missed coming, if I waited long enough. I never wore out an office chair, and I never wore out myself—and that's something not many men of fifty-seven can say if they've lived in towns.

"As for London, or England itself, for that matter, well, if I was a German I wouldn't waste my breath saying: 'Gott strafe England!' The folks that have to live there don't need any more punishment than that. Which is a rotten shame, for they are as fine folks as you'll meet anywhere.

"What they've got in England isn't a climate. It's a calamity! They put a steam radiator in your room, to be sure, but that's just camouflage. If they ever turned any steam into it, the thing would blow up in sheer amazement. They bring you as much coal as you can hold in your two hands—if your hands are small—and they charge you a guinea for making it smoke a little. They don't have any heat in their houses, and they don't wear enough clothes to wad a gun with! They get so used to being half frozen that they think they like it. They'd have spontaneous combustion and catch fire if they ever got really warmed through.

"You can have your London and your New York for all I care. The big West and the North for me! Montana's the place to live. You could build a wall around that state and never have to go outside for anything you wanted except tropical fruits and cotton. A man's word is as good as his bond out there. They began living that way when the courts were few and feeble. And now they've trained up their courts in the way they should go, so that a man's word is still as good as his bond, even if he has to go to law to have it settled."

"Did you get your nickname of 'Foghorn' out there?" I asked.

"I guess so. I've had it so long I don't remember who began it. But I do remember one time I was telephoning from Butte to Missoula, and Bob Smith—used to be governor of Montana—was there and he said:

"'Foghorn, why in hell do you waste money telephoning clear across the state? Stick your head out of the window! They'll hear you just as well.'"

When I asked him about the army rations, we were sitting at a table in the palm room of a New York hotel. Don't mind his verbal trimmings. You wouldn't, if you heard them at first-hand. He gave a scornful glance at the food on the table and replied:

"Hell! I had more to eat in the trenches than a whole gold mine would buy here in New York! This morning, at breakfast, a waiter shoved two little rolls at me—you had to squint twice at the plate to see 'em at all.

"'What's that?' I said.

"'R-r-rolls!' the waiter stuttered.

"'Go to blazes!' I said. 'I could stick one o' them in each cheek and then have room left to whistle through 'em for more. When I get up in the morning, I'm a full-grown man with a full-grown appetite. I ain't a canary bird!'

"Over there in France, I could eat a whole box of bully beef," he went on, "twenty-four pounds to the box—and all I wanted to leave was the cans. They used to feed us well and we bought a lot of junk for ourselves, besides. Fresh eggs? Why, you could buy 'em there cheaper than you can steal 'em in New York!

"It ain't so much what you eat, anyway, as the appetite you bring to it. I walked a hundred and fifty miles once in four days with nothing to eat but half a skunk. It was good, too! Nothing the matter with it except its size. I wished it had been big as an elephant.

"The trouble with you city folks is that your menus are bigger than your appetites. Anyway, it takes all your strength to pick out some little morsel you think you can pay for. Get out into the open, and you won't care what you eat, so long as it's something you can get your teeth into."

NEW BRANCHES OF CANADIAN MINING INSTITUTE.

At the meeting of the Rocky Mountain branch of the Canadian Mining Institute in Fernie, on March 30th, the proposal to form a Northern Alberta branch was favorably discussed. On May 14th at a meeting held at the University of Alberta, it was decided that a branch be formed and the following officers were elected: Dr. J. A. Allan, chairman; N. C. Pitcher, vice-chairman; J. T. Stirling, secretary-treasurer; N. M. Thornton, A. C. Dunn, John Shanks, L. C. Stevens and Thomas Henderson.

The Manitoba branch was formed at a meeting held in the University of Manitoba on April 18th. The officers are Dr. R. C. Wallace, chairman; G. R. Bancroft and T. B. A. Price, vice-chairmen, J. S. De Lury, secretary-treasurer; E. V. Neelands, W. T. Neal, Capt. G. B. Hall, J. W. Harris, F. de Sieyes, E. W. Jackson and E. E. Kain.

GRANBY.

The Granby Consolidated Mining, Smelting and Power Company has blown in its fourth furnace at Grand Forks, B.C., according to a report from that place. Three furnaces have been smelting almost as much ore in recent months as has been handled by four heretofore. The fourth was started to provide for an increase in the volume of ore reaching the plant.

THE BOUNTY ON ZINC

Victoria, B.C.—To the operators of the silver-lead-zinc properties of British Columbia the announcement that the Dominion Government has offered a bounty of 2 cents a lb. on all the zinc mined and smelted in Canada is of special interest. Owing to the special conditions this encouragement to the zinc industry will have a direct and no doubt a beneficial bearing on conditions in British Columbia; in fact, there is no doubt that it was designed with a twofold object in view, namely, the forestalling of the threatened closing down of the electrolytic zinc plant at Trail and the maintenance on a shipping basis of the many mines of the Sloean and East Kootenay Districts of British Columbia producing ore of the character in question. There has been some criticism in the Province on the ground that the bounty will be an aid to the Canadian Consolidated Mining & Smelting Company; but those most conversant with the problems which that concern has been and still is facing in dealing with the refractory ores referred to believe that the policy is warranted; that without a subsidy it would be impossible to keep the electrolytic plant going and avoid considerable loss; that the company probably would have been compelled so to do in view of the present quotation on ordinary prime spelter; and that such action not only would have thrown a large part of the Trail plant into inaction, but would have had a similar effect on many of the British Columbia mines which have been largely developed since the beginning of the war.

The refining of zinc in British Columbia dates from the beginning of the war, or rather a very short time afterwards. The story of the phenomenal rise in price of zinc is well known. Great Britain and her allies contracted for all there was available in the United States and quotations soared to 40 and 50 cents a pound. About that time the Imperial Munitions Board, having information regarding the very large bodies of zinc bearing ores of British Columbia, came to the Trail smelter interests and said, in effect, "If you are in a position to build, equip, and operate an electrolytic zinc plant we will guarantee you a market for all your zinc at 15 cents a pound for a specified number of years." To this the company agreed and the plant was installed. The expense involved went over six figures and, as a result, it became possible to handle successfully the silver-lead-zinc ores of the Province. The company fulfilled its contract with the Imperial Munitions Board. For a time it was supplying zinc at 15 cents when the outside prices were 40 cents a pound and over, but it had the satisfaction of knowing that it was in no way subjected to the fluctuations of the market and, while its understanding with the Board endured, it would not be affected by the metal unloaded by plants which sprang up all over America following the shortage to which reference already has been made.

There came a time, however, and it was not long ago, when the contract expired. Then, if the company was to continue its production, the electrolytic zinc of British Columbia would have to meet in open competition the prime spelter of the Belgian or distillation process. The quotation, which approximately still prevails, 7 cents a pound, according to the company, would not permit the maintenance of the electrolytic plant. It was because of the development of this situation, and the possible consequences of the cessation of its operation, which induced the Dominion Government, from all accounts, to adopt the policy indicated. With the

2 cents bounty the company will be in receipt of 8 cents a pound for its product (at present prices) and, no doubt, with this advantage, will be able to carry on. If the price rises the bounty diminishes and is eliminated entirely when market price reaches 8 cents.

Advocates of the bounty in the Canadian Parliament said that it was not proposed that it should continue for all time. It was a temporary expedient having the object of tiding the industry over a critical stage. Experiments were in hand in relation to the electrolytic process which, it was hoped, would make it possible to recover the zinc at less expense than at present and thus make the balance more even as between the output of the electrolytic and the Belgian processes. It has been stated that the subsidy will operate to the disadvantage of the French Complex Ore Reduction Co., which has been supported financially by the Provincial Government, and which is expected to solve the problem of treating the complex ores of the Canadian West. The answer given is that the bounty applies throughout Canada and that the product of the French Complex Company, in common with that of all others in the Dominion, will derive equal benefit.

By way of further explanation of the Canadian situation it may be said that there now is no special market for electrolytic zinc. The Imperial Munitions Board is not taking it, because it has supplies sufficient to meet all its needs. The reserve was considerably increased when large quantities intended for the Russian Government had been left on the hands of the British authorities.

WILL USE COAL INSTEAD OF OIL.

The possibility of fuel oil being unobtainable from California because of war exigencies is occupying the attention of most of the large industrial corporations of British Columbia which have been dependent on that form of fuel. The Powell River Pulp Company, one of the largest industries of its kind in the Northwest, has arranged to make a rapid change from oil to coal, should developments make it necessary. The same is true of the Whalen Pulp & Paper Mills while Mr. W. P. Hinton, vice-president of the Grand Trunk Pacific Railway Co., who was in the West a few days ago, states that his company has made representations at Washington, D.C., with a view to ascertaining the attitude of the United States Fuel Administration to the reported shortage of California fuel oil. Mr. Hinton explains that his company is particularly interested because of the steamers which it is operating in the Pacific Northwest. It is the intention to reconvert the G.T.P. locomotives using fuel oil on the 800 miles of line westerly to Prince Rupert to coal burners, and in this connection the company is interested in the development of the Telkwa and other Northern British Columbia Collieries, which are tributary to the Grand Trunk Pacific Ry.

An increase of wages has been demanded by employees of the Canadian Consolidated Mining and Smelting Co. in several of its mines. In most instances the miners have accepted the company's offer of substituting the Rossland mines scale in the lead mines, which means an increase of approximately 15 cents a day. Some, however, have refused this proposal. At the Sullivan mine, Kimberley, B.C., an increase of 50 cents a day was asked, which would give muckers \$4.15 a day and miners \$4.65.

WHY THE ELDORADO TALC MINE HAS BEEN IDLE.

Under a Madoc date line, the "Globe" recently published the following:

"The spirit of the British people is splendidly illustrated in a story that comes from the little mining village of Eldorado in the County of Hastings. The people of Canada will be surprised to hear that at the outbreak of war a brother of Sir Douglas Haig, the British Commander on the Western front, was in charge of a talc mine in this county, but they will not be surprised to learn that he went home to do his bit. Notwithstanding that he was sixty years of age, John Haig, elder brother of the Field Marshal, closed up his mining business and left for Britain, where he volunteered as a private. He gave his age as fifty and did not look a day older, it is said, the outdoor life having preserved his youthfulness. He was rejected, but did not give up the idea of going to the trenches. His brother, Sir Douglas Haig, did not know John was trying to enlist, for the latter apparently never told him. At all events, he did not use his influence to get a commission, but by his persistence and personality, he eventually secured a commission as second lieutenant, and is to-day a captain in a British infantry regiment, "somewhere in France." Mrs. Haig crossed the Atlantic with her husband and is nursing wounded soldiers, according to residents of the Eldorado district."

In this connection, it is interesting to note that the president of Eldorite Ltd., the company operating the Eldorado talc mine, is Sir Douglas Haig. His brother, John A. Haig, is managing director and was in charge on the property. The company owns the mine and mill at Eldorado, having taken over in 1914 the property of Canadian Talc and Silica Co.

RE-EDUCATION OF RETURNED SOLDIERS.

Ottawa, June 23.—The party of American technical educators who have been touring Canada, studying the work of industrial re-education of disabled soldiers, returned to Ottawa Friday morning and spent the day in conference with W. E. Segsworth, head of the Vocational Branch of the Department of Soldiers' Civil Re-establishment. They left for New York yesterday. They visited, Ottawa, Montreal, Ste. Agathe, Toronto, Winnipeg, Saskatoon, Edmonton, Calgary.

A member of the party said: "We have worked very hard, and our studies have been most valuable. One great surprise we had was in reference to the scope of the problem. Most of us, owing to having read a great deal of propaganda literature from France and other countries, were inclined to think that this work of re-education was limited to crippled men—that is, men with arms and legs off. We find, however, that these are only a small proportion of the disabled men who need re-education. A gunshot wound in the body or the head may produce a disability which in specific cases impairs vocational efficiency to a greater extent than the loss of an arm or leg. We were much impressed with the work that is being done in Canada, and were especially struck with the wonderful optimism of the men undergoing the training."

VIPOND.

Good ore is said to have been encountered at the 425 ft. level of the Vipond. Assays of samples across the workings show values of between \$20 and \$50 per ton, according to a wire received in Toronto by H. B. Wills.

JAMES DOUGLAS IS DEAD.

New York, June 25.—Dr. James Douglas, for many years president and lately chairman of the Board of Directors of Phelps, Dodge and Co., copper mine owners, died at his home here to-day in his 81st year.

Dr. Douglas was rated one of the foremost metal and mining authorities in the world. He was also a historian and writer of note and a philanthropist. He amassed a large fortune in his business.

He was born in Quebec, Canada, Nov. 4, 1837, was a distinguished graduate of Queen's University, Kingston, Ont., where he graduated in 1858, later receiving the degree of doctor of laws from McGill University for his work in the field of hydrometallurgy. In this he was associated with Dr. T. Sterry Hunt.

James Douglas, besides being an A.B. of Queen's University, studied medicine at Laval University, Quebec, and was professor of chemistry at Morrin College, Quebec. He acquired his first experience in mining and metallurgy through his connection with the Harvey Hill mines and other mining properties in Lower Canada, and left Canada in 1875 to take charge of the metallurgical operations of the Chemical Copper Company, a concern operating at Phoenixville, Pa., where he was first to separate, on a commercial scale, the precious metals from the copper by the electrolytic method of refining.

Dr. Douglas was Chancellor of Queen's University and its most munificent benefactor.

No. 3 MINE, CROWSNEST, RE-OPENED.

No. 3 Mine, Crow's Nest Pass Collieries, in which an explosion causing the death of 34 miners occurred on the 5th of April, 1917, has been opened to the face after fourteen months of work. When the inquest took place a few weeks after the accident only 22 bodies had been recovered. All now are accounted for, the majority having been found as the level was cleared and the last four about ten days ago when the face was reached. It is thought likely that the inquest will be re-opened, the verdict returned last April having been that "death was caused by an explosion, but from the evidence adduced the jury is unable to assign the primary cause." It is claimed by those who have held that the explanation of the disaster would be found when the scene at the most remote working place could be surveyed that the position in which the last four bodies were discovered to an extent bears out their contention. The evidence, however, seems to be conflicting. The men practically died at their posts. In each case their posture was such as would indicate that they had had some warning and had instinctively tried to shield their heads with their hands. One of their safety lamps was broken, and it is argued that this may have happened prior to the outbreak and be responsible for it. Mr. George Wilkinson, Chief Inspector of Mines, has left Victoria to make a careful examination of the mine and of the additional evidence secured.

Mr. E. P. Mathewson, until recently general manager of the British America Nickel Corporation, Toronto, has been appointed consulting metallurgist of the American Smelting and Refining Co., and its subsidiaries. His headquarters will be at the company's offices in New York.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

Mixing Canadian and American Lead Ores in B.C.

The wisdom of the imposition of an import duty on all raw ores coming into Canada was referred to during the closing days of the last session of the House of Commons. There is no doubt that, generally speaking, this would meet with considerable favor in British Columbia. It would not, however, be welcomed by the Canadian Consolidated Mining & Smelting Company, the largest smelter of Western Canada. The argument against it appears to be very strong, and it is considered doubtful whether, under the circumstances, the Federal Administration would adopt such a policy. In the first place, referring only to this Province and without any special knowledge of the conditions in the other Provinces, the imports of ore from the United States are not sufficiently large to warrant it. Secondly, the importations that have taken place, if the representations of the smelter officials are to be taken at their face value, have their basis in good sound reason. British Columbia lead ores carry excess zinc. A lead furnace cannot operate with over 12 per cent. zinc in the charge. As the British Columbia ores carry more, they must be diluted and consequently it is necessary to import from Washington lead ores nearly free from zinc. It goes without saying that the Canadian company in order to get this foreign lead must outbid the American smelteries nearer at hand and the former maintain that what they are doing is not to the disadvantage of the Canadian operators, from whom the complaints have come, but rather to their advantage as it is to render possible the treatment of their product.

Will Investigate Smelter Charges.

Within the next few months it is hoped that all matters of difference between the Canadian Consolidated Mining & Smelting Company and the mine operators of British Columbia will be satisfactorily adjusted. The Dominion Government has authorized the investigation of the company's schedule of charges and, in fact, its affairs in general, by a Commission. The personnel has been announced and seems to be satisfactory to all parties. It had been thought that its deliberations would have been in progress before, but delay has occurred owing to the fact that the Commissioners want a more exact definition of their powers. The inquiry, however, is to take place. It is assented to by the company, the management of which has agreed to throw everything open to scrutiny and it is believed that the outcome will be the establishment of a better understanding.

Dr. Stansfield Investigating B.C. Iron Smelting Possibilities.

Dr. Alfred Stansfield, D.Sc., A.R.S.M., F.R.S.C., Professor of Metallurgy at McGill University, Montreal, who has been commissioned by the British Columbia Government to make a special investigation and report on the adaptability of the iron ore of the Province to electric smelting, has arrived in Victoria and has the work in hand. He intends visiting Heroult, California, in the course of his researches, this being the only place in America where ores are being smelted electrically. The conditions at Heroult are believed to be much similar as to the quality of the ores handled and in other respects to those found in British Columbia which will make Dr. Stansfield's personal observations of value in the compilation of his report as to

costs of plant installation, quality and cost of product, etc., officials of the Heroult plant have assured the Canadian expert that he will be given every facility for the pursuit of his work at that point.

Making Pig Iron at Port Moody.

Pig iron is being cast from an electrically operated furnace in British Columbia, the new plant being that installed by the Aetna Iron and Steel Company at Port Moody. The pig is manufactured from scrap and the first runs were very satisfactory. It is a six ton furnace, with a capacity of about twenty tons of pig iron a day. Power is obtained from the Western Power Company of Canada, 1,300 h.p. being used in operation. Contracts for 2,000 tons of pig iron have been obtained, a portion of which will go to Japan.

Canadian Collieries New Plant in Operation.

The Canadian Collieries (D.) Ltd., has practically completed development work in connection with the opening of a new coal mine at South Wellington. The Douglas seam has been struck with a thickness of between 10 and 12 feet at the face. On Monday, the 17th June, the new tippie, screening plant, etc., was in operation for the first time and within a short time the output will be maintained, if expectations are realized, at between 750 and 1,000 tons a day. The product of this company at both its Extension and Comox Collieries, Vancouver Island, runs to about 70,000 tons a month.

Canadian Western Fuel Co. Opening a New Coal Mine Near Nanaimo.

The Canadian Western Fuel Company, of Nanaimo, B.C., has commenced operations on the sinking of a pair of shafts for the opening of a new mine on the company's farm near Nanaimo. These shafts are of ample dimensions, and are situated 150 feet apart. They are being sunk to tap the Wellington seam and will mean the area south-east of Jinglepot mine. Extensive drilling operations have been under way for some time to prove the measures and locate the best position to place the shafts. Excavating of the surface subsoil to bed-rock has been completed and concrete collars placed around the mouth of the shafts. Work on the hard stratified bed-rock commenced on Monday, the 17th of June. The seam will be uncovered at about 350 feet depth and if conditions are normal, coal should be reached in about four months. The cost of opening and equipping will involve an expenditure of about \$300,000. The company is producing upwards of 70,000 tons a month from its mines now in operation and looks forward to a considerable augmentation of this total. This will make the third new mine opened in the vicinity of Nanaimo, Vancouver Island, during the past year, the other two being now in coal. One was developed by the Canadian Collieries (D), Ltd., and the other by the Granby Consolidated Mining & Smelting Co.

The coal produced by the Vancouver Island (B.C.) mines during the month of May totaled 143,379 tons. This is 4,718 tons less than was produced in April, which is accounted for by the May holidays.

The tonnage produced by the various collieries was as follows:

	Tons.
Canadian Western Fuel Co., Nanaimo Colliery...	63,807
Canadian Collieries (D), Ltd., Comox Colliery.	50,163
Canadian Collieries (D), Ltd., Extension Coll'y.	19,781
Pacific Coast Coal Mines, Ltd., S. Wellington.	7,660
Nanoose Collieries, Ltd., Nanoose Colliery	1,968

143,379

The coal produced by Vancouver Island Collieries for the five months up to and including May, 1918, totalled 717,266 tons, as follows:

	Tons.
Canadian Western Fuel Co., Nanaimo Colliery.	328,299
Canadian Collieries (D), Ltd., Comox Colliery.	232,255
Canadian Collieries (D), Ltd., Extension Coll'y	97,781
Pacific Coast Coal Mines, Ltd., S. Wellington.	42,764
Nanoose Collieries, Ltd., Nanoose Collieries...	16,167

717,266

In spite of the fact that the Jingle Pot Mine, Nanaimo, has been closed all year; that Nos. 1 and 2 Slopes of the South Wellington Colliery of the Pacific Coast Coal-Mines have been abandoned; that No. 4, Extension Colliery, of the Canadian Collieries (D), Ltd., also has been abandoned; that No. 6 Mine, Comox Colliery, Canadian Collieries (D), Ltd., has been closed; and that some of the other mines have been put on single shift because of lack of labor, the tonnage of the Island Mines has been maintained to last year's standard, within a few thousand tons. To date the Western Fuel Company has made a gain over last year's tonnage of 60,000 tons and the Nanoose Collieries a gain of 9,786 tons.

NORTHERN ONTARIO.

High Grade Ore at Green-Meehan.

In addition to the mining of considerable low grade ore at the Green-Meehan property, there is also considerable high grade being encountered. The property is now being worked under the name of Edwards and Wright and under this management a discovery of high-grade silver ore was made the last week in April in a vein encountered at a depth of 245 feet. The vein was found in the diabase, close to and running parallel with the diabase-Keewatin contact. Since that time considerable lateral work has been done with favorable results and last week another vein carrying commercial values was reported to have been found. Owing to the favorable turn in developments in this section of Bucke township a good deal of attention is being shown to the immediate vicinity and much activity is anticipated.

Adanac.

According to an official advice, Mr. Alfred R. Whitman, geologist, has stated concerning the Adanac mine that "The indications seem to be entirely favorable, and that there is every encouragement to continue the North crosscut at the 310-ft. level. The flat shearing for over 200 feet back from the present face of the crosscut shows such strength and consistency, dipping towards the south that it can probably be regarded as distinct evidence of the correctness of former calculations regarding the dip of the diabase contact which the crosscut is approaching. The flat shearing which is coming in from the west dipping from the south-east instead of being contradictory evidence, rather tends to confirm the contour of the contact on former plans drawn. The vertical joining also tends to confirm the evidence of inclined shearing. The most economical exploration will be to continue the present north crosscut for probably 150 feet further before driving branch cross-cuts. When that point is reached the branch cross-cuts if driven should go both to the right and left equal distances." The conditions at the property are considered to be highly favorable for the development of commercial ore in the near future.

Private Wire to New York.

The Cobalt branch office of Messrs. Kiely, Smith &

Amos has been purchased by the brokerage firm of Hamilton B. Wills. Mr. A. A. Amos, who formerly handled the business, is being retained by the new owner as business manager. A direct wire service, the first of its kind to connect Cobalt and New York, has been installed and the inauguration was in the form of greetings between the Mayor of Cobalt and Mayor Hylan of New York City.

Extending Cobalt Area.

Considerable enthusiasm is apparent regarding the discovery of native silver made since the taking under option of forty acres of land on the west side of the Nipissing Central Railway from the N.C.R. by the Mining Corporation of Canada recently. This company is also negotiating for the purchase of two other claims, while a number of other Cobalt mining companies are also becoming interested in the district. Deals for properties now pending are: the Pride of Cobalt, and the Stratheona to the west of the track, and the Ruby Silver Mining and Development Company to the east, which property adjoins the Green-Meehan on the southwest. It is pointed out that a contact zone extends from the shore of Lake Temiskaming at a point known as Devil's rock and runs northwest for several miles through the township of Bucke. Considerable shearing occurs along this zone and a number of promising veins are in evidence. Enthusiasts declare that this heavy shear zone in Bucke township is the direction in which to look for the mother lode of Cobalt. While conservative mining men are sceptical, they look upon the peculiar structure of the Bucke township contact as decidedly interesting and worth investigation. In the meantime considerable exploration work is contemplated and the results of this will determine the correctness or otherwise of these different theories.

Kerr Lake Makes New Record.

During the month of May the greatest amount of silver for any single monthly period in its history was produced at the Kerr Lake Mine, the output amounting to approximately 268,213 ounces. As the company's working force is comprised of only about 105 men, the production from the property is around 2,500 ounces per man for the month. The cost of production at the property works out at a little over 25 cents per ounce and as the price of silver is close to the dollar mark, it therefore costs about twenty-five per cent of the total revenue for production, leaving a net profit in the neighborhood of seventy-five per cent. This indicates a net profit for the month of May of close to \$200,000, or at the rate of over \$6,000 daily. Compared with the month of April this is an increase of about sixty-seven thousand ounces of silver.

The company has introduced the "cafeteria" system of serving meals to its employes and has had it in force for the past fourteen months. The results of this method have been highly satisfactory, permitting of fewer waiters in the mess rooms and giving entire satisfaction to the management and employes alike.

Prospecting in Doherty District.

Considerable activity is apparent in the Doherty district. However, owing to the scarcity of men the work so far has consisted chiefly of trenching and sinking of test pits. In a number of instances discoveries of Cobalt bloom, and low silver values have been made. Results to date are considered to be highly encouraging.

Nipissing.

According to the monthly report of the Nipissing Mining Company for May, ore of an estimated value of

\$338,347 was mined and bullion and residue of an estimated value of \$581,625 shipped. Favorable developments at several levels in shaft 73 were encountered, a number of new veins being found. With one exception they are not wide, but produce both high and low grade mill ore. One of the veins is from two to four inches in width and contains assays from 2,000 to 3,000 ounces to the ton. All development faces continue to maintain their average width and assay. Extension of stopes at veins 96 and the Little Silver are giving extra tonnage. Exploration work at shaft No. 63 is proceeding but nothing of any value has been encountered to date. The diamond drill has completed a series of holes in R. L. 404 and is now drilling the first of a series of holes in R. L. 402. The total production for the month of May was \$338,347 and establishes a new high record for the current year and compares with an output of \$329,617 for the month of April. The production so far this year is the greatest in the company's history despite the fact of its being the fifteenth year of existence. An aggregate of fifty million ounces of silver now lies to its credit. That high grade ore still plays an important place in the aggregate production of the Cobalt camp is amply demonstrated by this month's statement under review, which shows 195 tons treated, which had an average silver content of 2,760 ounces to the ton.

Dome Mines.

The annual statement of the Dome Mines, Limited, was given out at the annual meeting held recently in Toronto. The ore reserves are estimated at \$9,945,000 as compared with \$11,979,000 for the year preceding. One dividend was paid during the current year. The surplus at the end of March, 1917, was \$697,051, as compared with \$524,797 at the end of the 1918 period. The most interesting facts appear to be that the ore reserves showed a decrease during the twelve months under review of \$1,033,242 owing to a revision of previous estimates. This statement is made evident by the fact that although the production amounted to \$1,030,758 the decrease in reserves amounted to \$2,034,000. Another disappointing statement is that in opening up the ore body "indicated" over a year ago by diamond drilling, which was supposed to have been 117 feet wide and to contain around \$17 to the ton, development work proved that the drill rods had deflected downwards and westwards and the hole is a drift hole in a narrow ore channel 12 to 20 feet wide instead of a crosscut hole in a horizontal plane as planned; showing plainly the unreliability of diamond drilling to prove value of ore bodies. A decidedly favorable feature in the report is the fact that 321,352 tons of broken ore remains in the mine, the costs of which has been absorbed in the current working costs. When the time arrives when the resumption of operations can be economically proceeded with, the large tonnage of ore broken will permit of operations being conducted profitably from the day of commencement. It has been decided not to recommence operations at the property until economic conditions improve and the management are disposing of some \$300,000 worth of supplies they have on hand and which while idle would show considerable depreciation in value. The main shaft is sunk to a depth of 1,250 feet at which point a crosscut is being run to the boundary of the Dome and Dome Extension to prove the ore bodies which, according to diamond drilling appear to be of good width and value at this point. While the ultimate successful future of the property is substantially assured, the development

will have to await a return of more favorable conditions.

Hollinger Pays Dividend.

A big surprise was sprung on the shareholders of Hollinger Consolidated Mines when a dividend was announced and paid on June 17th to shareholders on record as of June 10th. It is understood the payment does not represent the resumption of any regular dividend policy just at present, but that distributions will depend entirely on conditions. The outstanding capital of the company is a little over \$24,000,000, so that the distribution will amount to about \$246,000. The payment of the dividend was all the more surprising on account of it coming at the time when rumors were current to the effect that curtailment of operations at the property might be necessary.

Dome Extension.

Diamond drilling is reported under way at the Dome Extension mines on which the Dome Mines dropped their option during the past year awaiting a more favorable time for development. The drill hole is being sunk near the Dome line and has already been driven about fifty feet to bed rock. The operation is designed to discover the direction of the vein system.

Kirkland Lake.

The frame work for the mill at the Kirkland Lake Gold property of the Beaver Consolidated Mines is completed and part of the structure is already closed in. The work of installing the machinery has also commenced. The Beaver owns seven-eighths of the stock in this company. Three shifts are now being worked in the three-compartment shaft which is down to a depth of 200 feet in the barren rock. This working will, when completed, be the main shaft of the mine. Ore has been developed in the workings of this property to a depth of 700 feet in the old shaft. It is expected the new 150-ton mill on the property will be completed and in operation by the fall.

Vipond—North Thompson.

According to recent information the Vipond-North Thompson property is about to close down. Operations underground are being materially curtailed. The reason for the curtailment is the scarcity of labor and high cost of material, all of which makes it more desirable to leave the gold in the ground until such time as the margin of profit is more satisfactory.

Apex.

A meeting of the Apex directors was called for June 25th to consider plans for the development of the Bilsky property in Porcupine. It is evidently the purpose of the management to exploit the promising claim, but this will require further financing.

That Gowganda Road.

The work of repairing the roadway between Elk Lake and Gowganda is now under way under the supervision of Government engineers. Definite assurance has been given the mining interests of Gowganda that the road will be placed in good shape for traffic. Up to the present time upwards of a hundred thousand dollars has been spent on this thoroughfare. It is not known how much will be required to place the road in a satisfactory condition now. This matter, however, has been left chiefly in the hands of the engineers in charge. The main thing is that transportation to this increasingly active and promising mining district is being improved.

Gold in Teddy Bear District.

The formation in evidence in the Teddy Bear district is said to be very similar to that of the Lightning River

district. It is now presumed that the Teddy Bear gold finds occur in an extension of the rock formations outcropping in the Lightning River section, and if this proves to be true the whole will constitute a fairly large prospective area. The Teddy Bear is situated about seven miles west from the Ontario-Quebec boundary and the river empties into Lake Abitibi.

Metachewan.

The Mining Corporation of Canada is understood to be negotiating for the purchase of the Davidson property in the Fort Metachewan district. Mr. Charles Watson, manager of the company, recently visited the district making examination of the property. The Davidson property is well known by reason of the fact that it represents the first important gold discovery in this new district. Other discoveries of gold had been made prior to that on the Davidson, but they did not appear sufficiently important to attract prospectors or capital on anything but a small scale. The water power on the Montreal River in close proximity to the Fort Metachewan gold district has been optioned to the Mining Corporation. A considerable volume of water pours over the falls which has a drop of approximately 45 feet. By erecting a dam this head could at small expense be increased to about 60 feet without flooding a great deal of country. It is estimated that upwards of 5,000 h.p. could be developed. Should developments in the district warrant it this water power could be made available at reasonable cost.

McIntyre.

Official figures show that the McIntyre-Porcupine mines produced during the first quarter of the current year approximately \$430,000. This is at the rate of \$143,000 a month or \$1,716,000 per annum. This would appear to indicate a net profit of \$750,000 or \$800,000. The last dividend, payable June 15th, amounted to about \$180,000. Net earnings are therefore just about sufficient to make four such disbursements annually, or twenty per cent. on the company's issued capital. This achievement under present conditions goes far towards proving the strong physical condition of the mine.

Miller Independence.

A new vein about eight feet wide has been discovered at the north side of the Miller Independence property at Boston Creek. The new vein carries visible gold and gold tellurides. Heretofore the Miller Independence has been exploring veins which were narrow and the tonnage available was comparatively small. However, the new vein just discovered, providing it proves consistent with depth will remove this difficulty. The vein is situated on low ground and is well defined with a strike approximately east and west. The work of sinking a new shaft has commenced on high ground a short distance south from this vein and owing to the latter having a considerable dip to the south it is expected it will be encountered before reaching a very great depth.

Gold from Martin Property.

A gold bar, the first shipped from the property of the Martin mining company, situated on Lake Keniwisik, some 46 miles from the railway, near Amos station on the Transcontinental railway in North-Western Quebec has been sent out. Mr. Martin, the contractor who constructed the mill of the Hollinger Gold Mines, with a number of friends, owns the mine. The mill consists of two stamps, and the mining at present is being done from surface, the deepest shaft being down a depth of about thirty feet. A force of twelve men do the mining and milling and the employees are all shareholders of the company.

Elliott-Kirkland.

Drifting at the 400-ft. level of the Elliot-Kirkland property is under way and ore of a commercial grade has been encountered, thus establishing the fact that the vein is the westward continuation of the ore body of the Kirkland Lake Gold.

Kirkland-Porphry.

Work has been suspended at the Orr property in Kirkland Lake under option to the Kirkland-Porphry. A cash payment of approximately half a million dollars falls due about the 1st of September, and various rumors are current regarding the future financing of this big payment. Recent developments at the property have been of a decidedly encouraging nature and the present suspension of work would appear to be in no way due to lack of merit in the property. The continuation of the vein was recently cut at the 400-ft. level and showed a width of about 32 feet, 22 feet of which gave values of over \$20 to the ton.

Patricia.

The mill at the Patricia mine in Boston Creek district is being given a try out. Last week during an early test run a mishap occurred causing a breakdown. The part has been repaired and this week the mill is expected to receive a thorough trial. Meantime underground work is being carried on at record rate. Drifting along the 200-ft. level is proceeding. Stopping operations are under way and the ore being encountered is of a high grade.

Hattie Gold.

A new gold discovery has just been made on the property of the Hattie Gold Mines, Limited, situated in the township of Coulson, north-east of Matheson. The vein is about six feet in width and contains visible gold and tellurides. The company has a gang of men trenching and stripping and the intention is to commence sinking as soon as possible, for which purpose a plant will be installed. It is proposed to drive the shaft to a depth of 300 feet.

Ontario Kirkland.

Arrangements have been completed for the erection of an electrically driven mining plant at the property of the Ontario Kirkland Mining Company, formerly known as the Hurd property and lying about two claims to the south from the Wright-Hargreaves. The work of construction for the transmission line is under way as is also the erection of additional camp buildings. There are a number of veins in evidence on the Ontario Kirkland on one of which a shaft has been sunk to a depth of 100 feet where results met with are understood to have been up to expectations. The initial development calls for the sinking of the shaft to a depth of 300 feet, where lateral work will be carried on.

Lake Shore.

Two gold bars of an approximate value of \$45,000 were shipped from the Lake Shore mine this week. These bars weighed 92 and 93 pounds respectively, and the fact of this shipment is taken as conclusive evidence of the satisfactory operation of the Lake Shore Mill.

Ankerite.

According to reports just to hand from Porcupine the suspension of operations at the Ankerite property of the Coniagas Mining Company has been decided upon. This decision was reached following a visit of some of the directors to the property. The cost of operations during the present abnormal period for both labor and material is said to be the reason for the contemplated temporary suspension of work.

The Canadian Ingersoll-Rand Co. have just issued a new catalogue of their direct lift vertical air hoists. The booklet is well illustrated, and gives complete details of the different types of valve used for various classes of work up to five tons capacity—the dust proof single acting, the dust proof air balanced, the dust proof double acting. Complete tables are given, including a useful table of the free air consumption of the hoists.

Sullivan Machinery Co. have published a new catalogue on Coal Mining Machines, No. 73. This bulletin describes in full detail the Ironclad Sullivan Coal Cutters, for both room and pillar and longwall mining. The Sullivan Machinery Company was first to bring out an electric chain mining machine, for operating in rooms, on the longwall or continuous cutting principle, which is now generally recognized as the most efficient method of cutting coal in use in this country. This bulletin describes the direct current and alternating current Ironclad, and Turbinair Ironclads, by means of which compressed air drive is made efficiently applicable to coal cutter work for the first time. Explosion proof Ironclads carrying the Government approval, as the result of U.S. Bureau of Mines tests, are also described, and the protective devices for gaseous mines illustrated.

A unique and handy little device for opening up the water hole in hollow steel has just been placed on the market by the Denver Rock Drill Manufacturing Company, Denver, Colorado, whose exclusive sales agents in Canada are the Canadian Rock Drill Company, Ltd., of Toronto. It consists of a punch and hammer set in an air feed cylinder, which drives the punch into the steel and withdraws it in combination with the hammer action. It is designed for use with their Model 8 Sharpener to be mounted on the pedestal back of the clamping vise, but it may be mounted separately or even adapted to other machines. The operation is extremely simple and a slight alteration of the control handle will either drive it forward or withdraw it. This device will open the water hole in a bit or shank in one-tenth the time required to perform such an operation by hand.

The U. S. Railroad Administration announced under date of May 28th that the pig iron rates will apply on pyrites ore from Sault Ste. Marie, Ontario, ex Goudreau, Ont., to Cincinnati, Cleveland, Columbus and Detroit, effective May 30th, and to the other Central Freight Association points effective June 30th, by the Minneapolis, St. Paul and Sault Ste. Marie Railway. The tariffs of the Duluth, South Shore and Atlantic Railroad will be issued to become effective on statutory notice.—“American Fertilizer.”

Shanghai, China, June 24.—An agreement has been virtually concluded between the Chinese and Japanese Governments, it has been learned by The North China News, under which the iron mines at Feng Huan Shan will be worked by the Chinese Government, and steel will be manufactured by the Chinese and Japanese. It is said that the Japanese will provide 20,000,000 yen to defray the expense of carrying out the work.

This means, it is said, that the Japanese will virtually acquire control of the entire output of the mine. At present they are negotiating for the right to participate in the working of the property. Pending decision, the final signing of an agreement has been delayed.

ASSAY OF TUNGSTEN MINERALS.

H. W. Hutchin of the Camborne Research Committee in a paper written for the Institution of Mining and Metallurgy, London, describes the use of cinchonine in the assay of tungsten minerals.

The assay of tungsten minerals has developed in the main along two lines of attack, viz., attack with acid and attack with alkali, either by fusion or digestion. The acid attack permits the determination to be made by means of the ignition of ammonium tungstate or mercurous tungstate, whilst the alkali attack confines itself to the mercury determination. The methods for the assay of tungsten mineral, as sold to the metallurgical works, whether the determination is based on an acid attack or an alkali fusion, are well established and satisfactory; but the position with respect to the intermediate products of the mine in the various stages from ore-bin to finished products was, until comparatively recently, very unsatisfactory. The weakness of the acid attack with poorer products lay in the frequency of low results, so low in some cases as to be reported absent when present in fair amount. On the other hand the fusion method was so hedged about with restrictions that it was too lengthy an operation for everyday use. The substitution of a selective attack by digestion with caustic soda solution for a fusion, by Hutchin and Tonks, was an improvement, but still left the position open to the objection that there was no readily available and dissimilar method to which reference might be made.

With the use of cinchonine that objection disappears; in the acid attack, cinchonine serves as a means of separating dissolved tungstic acid from the acid liquors of the assay, and the weakness of the acid attack is thus counteracted. In addition, cinchonine may be used as an alternative to the mercury method in the determination of WO_3 in the methods based on an alkali attack.

The base cinchonine, a bulky white powder, is almost insoluble in water, but readily soluble in dilute HCl. A convenient strength of solution is 5%. It is prepared by weighing out a definite amount of the base, diluted with water and the minimum of HCl added until solution is complete: warming the solution assists the operation. When dissolved the solution is diluted to the required volume. The solution keeps indefinitely and 5 cc. is sufficient for quantities of WO_3 up to 100 mg. Quinine in the form of dichloride may be used and answers just as well.

AUCTION SALE

of

Valuable Graphite Property

Near Buckingham, Province of Quebec, Canada.

The undersigned will offer for sale by public auction at W. A. Cole's Auction Rooms, No. 63 Sparks Street, in the City of Ottawa, Canada, at 2.30 o'clock in the afternoon of the tenth day of September, 1918, the property known as the "Walker Graphite Mine," in the Township of Buckingham, comprising about 1250 acres of land, held in fee simple. The property is situated about six miles from the town of Buckingham, on the Canadian Pacific Railway, between Montreal and Ottawa, and less than ten miles from the landing on the Ottawa River. The quantity of ore is practically inexhaustible, and the mining facilities are exceptional.

The buildings consist of refinery, engine and boiler house, manager's dwelling, foreman's dwelling, and other buildings. The lands are well timbered and contain ample supplies for mine purposes and fuel. The right to cut basswood until the 1st day of March, 1919, has been sold.

A large quantity of machinery, plant and tools on the property will also be sold as a separate lot. Both sales will be subject to reserved bids.

Applications to inspect the property may be made to Mr. Sam. Devine, Buckingham, Quebec, Canada, and further particulars may be obtained from

M. J. GORMAN, Vendor's Solicitor,
Union Bank Building,
Ottawa, Canada.

Oxy-Acetylene Welding and Cutting

Conservation vs. Waste

Oxy-Acetylene Welding Outfit, employing Prest-O-Lite ready-made Acetylene and Compressed Oxygen, both in portable cylinders.

OXY-ACETYLENE Welding is proving a great economic factor in the Factories, Mills, Railroads, Mines and Machine Shops of Canada. The Nation's scrap pile is one of the worst enemies of Conservation. Hundreds of thousands of dollars' worth of damaged, worn or broken tools, castings, pipe and machine parts lie rusting on the scrap piles of this country. Much of this enormous waste is now being eliminated by Oxy-Acetylene Welding. Losses

due to breakdowns—resulting in "tie-ups" of operating equipment—are also being greatly reduced.

Prest-O-Lite

PROCESS

is ideal for all classes of metal repair work. It handles repairs quickly and efficiently—often right on the spot—makes broken or worn parts strong as when new—saves times which would be wasted waiting for replacements—abolishes the "Scrap Pile."

The welding outfit is portable—available for outside work as well as for shop use.

No matter what other welding method you now use, a Prest-O-Lite outfit put to work in your shops will quickly pay you profits.

Write NOW for special literature and data that will point out ways to reduce waste and increase efficiency.

World's Largest Makers of Dissolved Acetylene

PROVINCE OF ONTARIO

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Preliminary returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth \$71,060,942, of which the metallic production was \$56,845,788.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

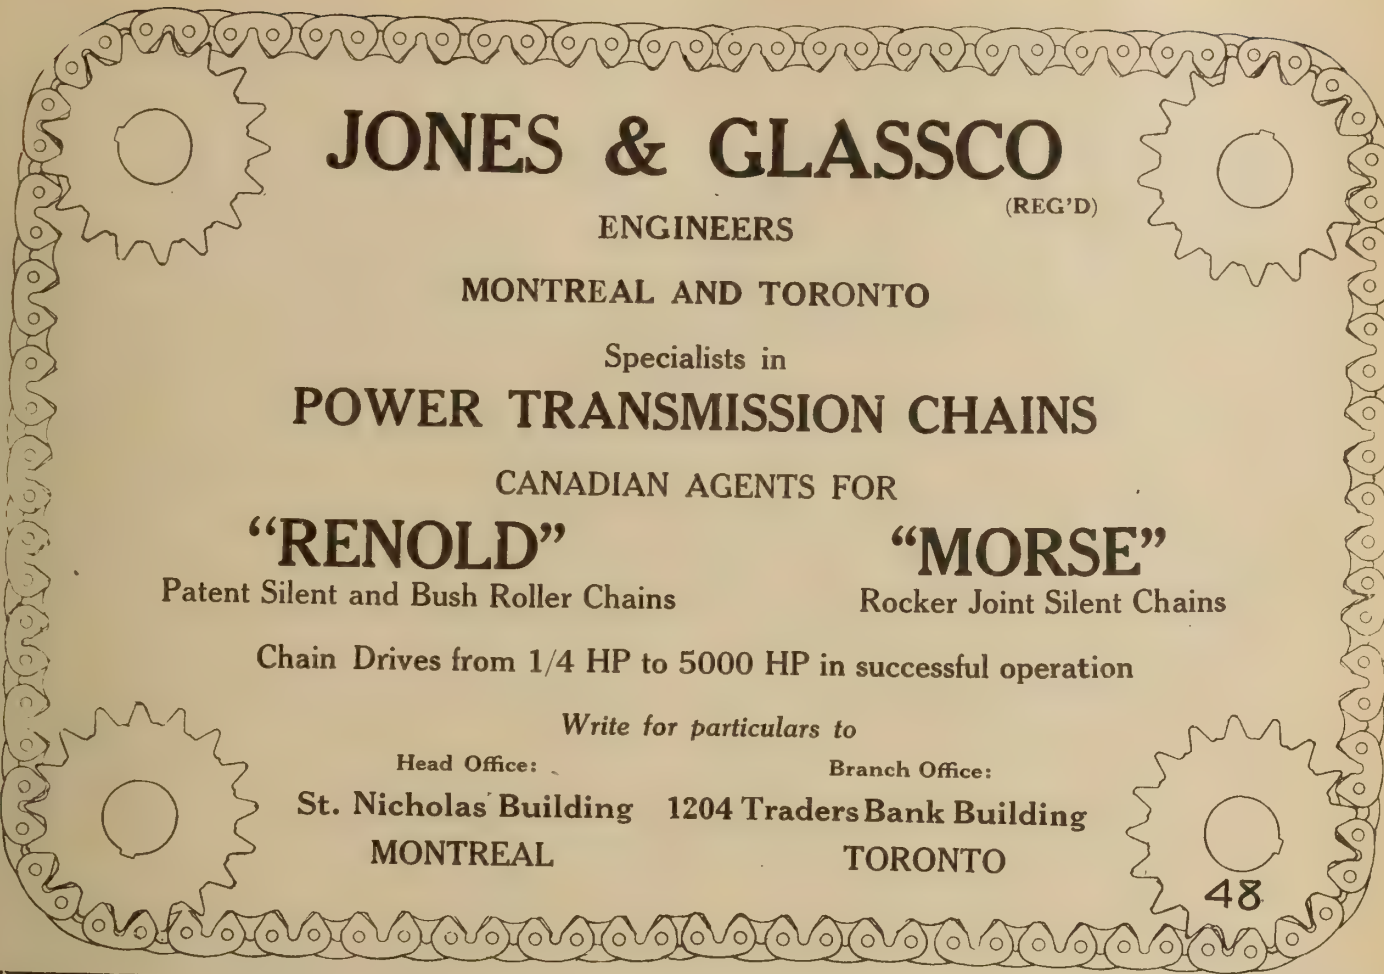

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

X

—drill-bits like these—

and shanks —clean, uniform, correctly made, will increase your drilling speed and cut down your steel and drill repair bills.

You can make these bits and shanks by the ALL-HAMMERING PROCESS in the SULLIVAN DRILL SHARPENER.

The Double-Arc Bit

marked by an "X" above, is a new Sullivan Bit, which is making a name for itself because of its remarkable cutting and reaming qualities. The "Double-Arc" holds its drilling speed and its mudding ability as the depth of the hole increases, in an unusual degree.

Automatic Variable Gauge Dies

are now available with Sullivan Sharpeners (see lower cut). You can make bits of 16 different gauges with one set of dies. The adjustment is by thumb-screw. It's a hammer—swaging action.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

The Jackhammer

FOR BENCH WORK, SHAFT SINKING,
OR FLAT HOLES

Small upkeep, can be run wet or dry; valves, rotation, control, are of simple type, giving no trouble.

Can be quickly transferred to and from mounting for horizontal holes. Works well in all kinds of rock—nickel, copper, or asbestos bearing.

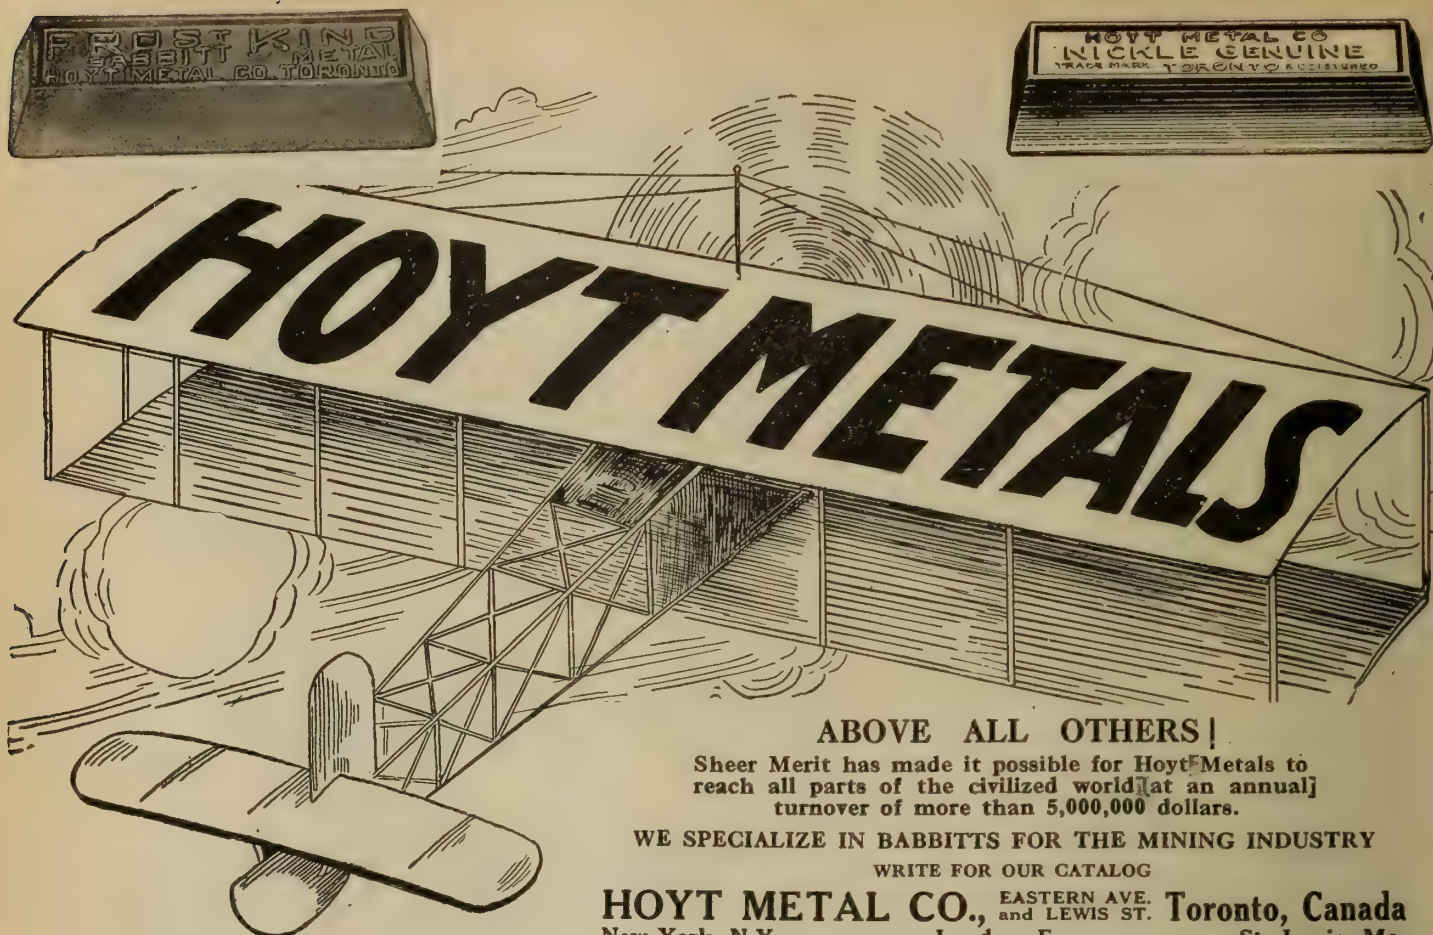

The Jackhammer will often handle jobs usually given to heavier drills.

SPEEDING UP!

A MOST VALUABLE LESSON THIS WAR HAS TAUGHT

SPEED, EFFICIENCY, ECONOMY

The war has given us an overwhelming example of the importance of these three great lessons. Speed is most essential, but no speed that has staying power is attained without efficiency. Economy is also needed, but it is economy of time, materials and labor, not merely economy in first cost that counts.

By using the "New Cleveland" Stoper, you will attain speed equal to double that of any other drill on the market. Its staying power is equalled by none. Its drop forged parts of simple design, which are practically unbreakable, give you economy in time and repairs; also the air consumption is low because of the "Pocket-in-head."

Give us an opportunity of proving these facts to you. No obligation on your part.

IMPERIAL WELDING AND CUTTING EQUIPMENT OXY ACETYLENE PROCESS

**Avoid Shut-Down or Delay
When Emergencies Arise**

The tool equipment of every mine is incomplete without an Imperial Welding Outfit. Within a few hours after the most serious break, metal parts will be inseparably joined and work continued, as a result of its use. First in Economy, Efficiency and Safety, the initial cost of an Imperial Equipment is often repaid in a single operation.

Write today for catalog, containing valuable data on cost of operation, work actually done, etc.

PRINTING AND PUBLISHING

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing and distributing Annual Statements, Special Reports, Descriptive Pamphlets, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction.

We shall be glad to furnish estimates to enquirers.

Electric Hoists

Steam Hoists

Steam hoists hold their own in many fields, but the application of electricity to hoisting machinery has advantages, including the facility and economy with which power can be transmitted to places which could hardly be reached by any other method. We have accurate data on every important point in power house equipment, and no other company is as well prepared to assist in an investigation of any of the problems involved in the application of power to hoisting.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping. Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all Infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have Infringed our patents, notice is given that a settlement for such Infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

MASSCO

ASSAY EQUIPMENT

The laboratory or assay department cannot be too careful in selecting equipment. Operations here are just as important and sometimes more important than those in the mine.

Use Massco Assay Equipment with full confidence. It has passed all of our tests—it will meet your approval.

The Samson Jaw Crusher

The intermediate crusher for the laboratory. Will rapidly crush the hardest rock as well as sticky ores, giving a uniform product. Has a large capacity and will not choke with sticky material that does not adhere to the plates.

Can be cleaned while running at full speed. Furnished in two sizes. The Massco for hand power, capacity 150-250 lb. per hour, weight 250 lb. The Number 00 for belt drive, capacity 300-500 lb. per hour, weight 300 lb.

The McCool Pulverizer

For grinding ore samples or preparing control pulps. Grinds from $\frac{1}{4}$ in. to any fineness. The only pulverizer with equal wearing on both discs. Dust proof, All parts readily accessible for cleaning.

CHEMICALS

We carry in stock the highest grade C.P. Chemicals for Laboratory requirements. We are selling agents for the Shattuck Chemical Co., who manufacture high-grade Molybdic Acid, 85%; Molybdic Acid, 100%; Ammonium Molybdate, Uranium Salts, Phospho-Tungstic Acid, Sodium Tungstate, Potassium Permanganate, etc.

All guaranteed to be strictly in accordance with analysis shown on each label. The Molybdic Acid is a remarkably high-grade product for phosphorous determination.

The Geo. Taylor Hardware Co., Cobalt, New Liskeard and Cochrane, carry in stock Massco Clay Goods, Crucibles, Muffles, Scorifiers, Roasting Dishes, Lindsay Oil Furnaces, Heusser Balances and Samson Laboratory Crushers. Send them your inquiries.

Use every bit—That's real food conservation

KLIM means milk conservation in camp. It is pasteurized separated milk in powder form. It never sours or spoils, it requires no refrigeration or special care, every bit can be used. Whether you use a whole tin in a day, or in a week, or in a month, the Klim at the bottom of the tin will be found as good, as sweet and as fresh as that from the top. Klim contains no preservatives or adulterants. It is simply the solids of separated milk—nothing but the water removed, nothing whatever added.

Klim is Genuine—The Flavor Proves It.

Get Klim from your supply house. Order with other food supplies. In 10 lb. tins, 6 tins to a case.

At a recent conference with mining engineers in New York, Mr. R. V. Norris of the fuel administration said in regard to the coal shortage that the situation is serious and is going to continue to be serious. With a shortage of labor amounting to 30% production has been increased 20%; but greater increase is necessary. The railroads have done well and Mr. Norris stated that "the zone system of distribution has saved us 160,000,000 car miles a year."

The labor problem in every producing district is a serious one; but it is folly to attribute all our troubles to labor shortage. As has been shown by the coal operators in Western Canada, our coal mines could produce a much larger tonnage if the demand warranted continuous operation throughout the year. While men and machinery were idle at Western Canadian mines last summer, the Canadian railroads were busily hauling Pennsylvania coal westward to Winnipeg and beyond. This state of affairs has very properly been exposed and has resulted in action being taken by the

DANGER OF COAL SHORTAGE IS NOT YET REALIZED.

There has been a complete failure on the part of the public and (as the Government of any democratic country merely reflects the opinion of the general public) there has also been a failure on the part of the authorities to realize the fundamental importance of coal in the prosecution of the war. Great Britain, the United States and Canada all show a falling off in the production of bituminous coal this year as compared with 1917, and what the coming winter has in store for us it is not pleasant to contemplate. Governmental action so far has consisted in suggesting increased production through increased efficiency of the remaining workers, in the greater use of mechanical appliances, and in the adaptation of the transportation facilities to the seasonal demands for coal, with particular reference to the needs of domestic consumers. All these measures are but palliatives, and no one seems to have had the courage as yet to tackle the root of the trouble, which is the shortage of men digging coal at the face. There is the neck of the bottle; there is the true restriction and limitation of bituminous coal production which threatens worse troubles next winter than were experienced last winter.

Under the circumstances it would be amusing, if it were not so serious, to read of discussions in Winnipeg and other Western cities as to the hardships inflicted upon the householder by enforcing the substitution of soft coal for anthracite. The Winnipegger will be glad to get anything that will burn next winter. The Fuel Controller is doing all he can to alarm the people of the western cities as to the necessity to get in their winter coal during the summer, but apparently some wise people think the Fuel Controller is a bugaboo. It is not possible to exaggerate the dangers of disregarding the Fuel Controller's advice in this matter, nor is it possible to overstate the importance of the collieries of the Canadian West raising every pound of coal that can be mined before the frost comes.

In the recent registration questionnaire it was evident that the Government realized the importance of farming, but what will be the advantage of raising wheat and other produce if there is no coal to transport it? Coal is the first need of modern warfare. It comes before man-power, food production, munitions or anything else, because without it all these other departments of war's varied needs are immobilized or non-existent. As Lloyd George has inimitably phrased it, "coal is the paramount lord of war." It is strange when the leader of our democracy expresses so clearly the place of coal to-day that so little attention has been paid to the increasing of its production, and that the authorities have been principally exercised over the suffering of the individual householder that arises from

but when coal production declines to a point where it threatens the production of war munitions and hampers the movement of troops and munitions, it throttles all national endeavor at its source.

Coal-mining to-day is not an industry within the general acceptance of that term. It is a department of national defence. Without it, the presence of our troops on the firing line cannot be. Why, then, should the production of coal, of all things, be distinguished by a decline that other and less essential occupations do not show. Steel, wheat, men, ships, guns, shells, money, all these things, and many others are but a transmutation of coal, merely the finished product of materials that have been mined, assembled, and manufactured with the help of coal. Coal is basic, fundamental. When will the fact be realized?—F. W. G.

THE GOSPEL OF UNITY.

One of the most notable figures in America to-day is Mr. Samuel Gompers, President of the American Federation of Labor. Mr. Gompers before the war was an extreme pacifist; but he quickly woke up when Germany set the world afire. Since then he has helped citizens of the United States to realize the dangers that confronted them, and he will always be honored for his part in preparing his country for the battle for freedom, which his vision enabled him to see in what, to many of his fellows, seemed to be merely a European quarrel. Mr. Gompers visited Canada recently and while here he made it clear that he has not been fooled by the sophistry and pretences of the Socialists. In view of what he has done and is doing his words have considerable weight and his appeal for unity was well received throughout the country. He closed his address to the Canadian Club with the following words:

"I ask and appeal for the unity of the people of Canada. I cannot find words to express to you my appreciation of the magnificent courage, of the wonderful contribution which the manhood and womanhood of Canada have given to this great cause voluntarily. I appeal for still stronger and greater sacrifices if needs be. I am making the same appeal to my fellow-countrymen in the United States. I wish that I could go abroad to my fellow-workers of Great Britain and of France. I wish that I could go to the front and give a word of cheer and heartening to the fighting boys there. But I am advised that the best service I can give is to remain at home and occasionally go to the men who are in accord with us and help to spread the gospel of unity of spirit and purpose, and solidarity, and sacrifice, in order that we shall not fail; and we dare not fail.

"The clock has struck. The time is tolled. Every man to his post of duty, where he can give the best possible service for the common cause. Men must fight. The men at home must sacrifice—must work, give service, buy bonds, spare all that can be spared, that our

fighting men over there shall be supplied with everything that they may require to put up the fight that shall win. It is either to buy bonds and pay taxes for freedom, or to pay tribute and indemnity for the Kaiser and unfreedom—that is the choice. And for us, who not only understand what freedom means, but who have grown out of the loins of men whose forbears were the men who fought for freedom—for the men of to-day who have freedom, enjoy freedom and practise freedom, there is no choice. Men of Canada, fight on, carry on, and victory will be yours and ours, for the whole world and for the generations yet unborn."

B.C. LEGISLATURE MAY RE-ENACT LEGISLATION RE COAL LANDS.

Discussing the disallowance by the Dominion Government of the Provincial Statute giving the early settlers within the Esquimalt & Nanaimo Railway Belt the right to apply and, their claims on examination proving sound, to receive Provincial title to the coal rights in their lands, Hon. John Oliver, Premier of British Columbia, recently stated that he saw no reason why the Provincial Legislature, at its next session, should not be asked to re-enact the legislation. This is taken to mean that the Province will insist on its power to give the settlers the privilege indicated. It also means that the present British Columbia Government is likely to maintain the principle of Provincial authority in the case in question. The issue is one of vital import not only to the settlers, whose coal lands are at stake, but as well to the Granby Consolidated Mining & Smelting Co., which holds Provincial title to valuable coal areas, and to the Canadian Collieries (D) Ltd., which claims title to all the non-alienated coal lands in the Railway Belt by virtue of the terms of the subsidy granted to the E. & N. Railway Company in 1884.

B.C. MINERAL ACT NOW APPLIES TO TUNGSTEN, ETC.

The Mineral Act of British Columbia has been enlarged by Order-in-Council to apply to tungsten, fluorine, vanadium, radium, and uranium, or any combination of these elements "with themselves, or with any other elements." This action was taken by the Provincial Government on recommendation of Hon. Wm. Sloan, Minister of Mines. Without exception, these are minerals the importance of which has been accentuated by the war, some to a greater extent than others. It having been brought to the attention of the Department of Mines that there are occurrences of fluorspar and of scheelite in British Columbia it was decided to lose no time in bringing these and other minerals, heretofore outside the scope of the Act, but imperatively needed in the manufacture of munitions of war, within its provisions. It may be stated by way of explanation that the Provincial Mineral Act, and its definition of mineral, were drafted twenty years ago when the minerals in question were unconsidered so that they have been in the anomalous position of being unstackable under the Act in a legal sense, although common sense and the necessities of the times demanded their inclusion. Incidentally it is pointed out that the British War Board has asked the Canadian Government to produce as much vanadium as possible, while the need of tungsten also is great. Not an inconsiderable market for fluorspar exists at the smeltery of the Canadian

Coal Production in Nova Scotia During the First Half of 1918

By F. W. Gray.

The production of coal during the first six months of 1918 in Nova Scotia shows a decline from the outputs of the corresponding period of 1917 of approximately 330,000 tons. The falling off is principally to be found in the production of the larger coal companies and it is slightly offset by one or two increases. The net result, however, is a decrease. In the writer's review of the Nova Scotia coal trade for 1917 it was forecasted that the yield of 1918 would in all probability show a decline from 1917 of 350,000 tons, and unfortunately this forecast has been almost realized in the first half of the year. During the next six months, barring accidents, it is not to be anticipated that the rate of decline will be quite so rapid as it was during the first six months, but no increase can be expected, and a further diminution of the rate of production is only too probable. It would look as if the 1918 figures would be about 400,000 tons below those of 1917.

Weather conditions in January, the explosion at the Allan Shaft Colliery, and some very minor labor troubles have partially caused this falling off from last year, but the real and important reason is the shortage of underground workers, and more particularly the insufficient number of men qualified to work at the coal face.

It has not been fully realized, how specialized is the occupation of the workman who "digs" coal, nor how largely the drain of voluntary and draft enlistments has fallen on this class of underground worker. In the organization of a colliery there are men who are classed as producers, and other men who are classed as "non-producers." The use of this last-named term does not imply any lesser importance of the work to which it is applied, but it is very essential that the respective proportions of producers and non-producers should be correct. Enlistments have taken away an undue proportion of the producing class, and while some readjustment is possible by transferring men from the non-productive classes to the productive class, this readjustment can only have a very limited range, as a large part of the underground non-productive class, and practically all the surface workers are unfitted for work at the coal face, either by being too young or too old, or by physical inability and in some instances by a distaste for the work of the actual miner. As the producers dig the coal, and the non-producers handle and prepare it for market, it is evident that the output of coal is limited and controlled entirely by the available number of producers. If all these men were taken away there would still be a very considerable number of workers left at the collieries, but there would be no coal for them to handle.

The disproportion between the respective classes has now become so great, that it can only be overcome by closing down some mines, and concentrating the workmen in the collieries selected for this purpose. If this readjustment is forced by the conditions existing, and it seems inevitable, then a certain number of older men, or physically ineffective men, will be thrown out of employment.

A statement issued by the Standard Silver-Lead Mining Co. in Spokane, Washington, indicates that that company operated at a loss of \$7,010 during the month of April, as against a profit of \$26,255 in the

EXEMPTION OF COAL MINERS CONTINUOUSLY EMPLOYED.

Coal mining is classified in Canada as a work of national necessity and coal miners are dealt with as a special class in the enforcement of the Military Service Act of Canada. The course to be pursued in regard to application of conscription to the miners has been a matter of serious consideration to the tribunals charged with power to grant exemptions, temporary and permanent, in British Columbia, and other western mining Provinces of the Dominion. The attitude assumed by His Honor Judge Thompson of British Columbia recently, may be taken as indicative of the generally accepted policy in this respect. In the Crowsnest Pass Coal District he was confronted recently with a blanket appeal for exemption for 36 men having the backing of the United Mine Workers of America and based on the contention that the appellants were engaged in a work of national importance. After hearing all the evidence as to the actual time being worked by each man, the amount of coal produced and the individual earnings, he allowed 31 applications for a limited period, renewal being conditional on their maintaining their average production of coal.

In giving judgment Judge Thompson established the following rules:

1.—In cases where I grant exemption it shall be conditional upon the appellant being continuously employed in his occupation, either that in which he is now engaged or some other occupation in the mine. Any person ceasing to work for more than 24 hours will be deemed to be not continuously employed, unless he can show some just cause or reason for his non-employment. This prohibition does not apply to recognized holidays and the holding of funerals.

2.—A lay-off of 24 hours without just cause or reason being shown shall not occur more than once a month. In case of illness a certificate signed by some medical practitioner must be produced within 48 hours and if demanded by the military or civil authorities produced and filed in the office of the chief of provincial police at Fernie, B.C.

3.—In the event of a strike or cessation of work by workmen other than exempted men whereby the latter are prevented from working, exemption shall cease, subject, however, to the provisions in rules 9 and 10. (These are certain rules laid down in the agreement subsisting between employer and employe in this District.) Judge Thompson here observes: "This may seem a harsh ruling, but it must be remembered that this appeal has been made by the United Mine Workers of America and it will be the duty of the officials of the brotherhood to see that no such strikes or cessations of work occur."

4.—No exempted man shall occupy an official position or carry on work which will necessitate his absence from work at his usual occupation in the mines. In the event of any person to whom exemption is granted desiring to change his employment from one employer to another he may do so upon application being made in writing to me and a certificate allowed by me.

5.—In the event of any dispute arising between the military authorities and any person to whom exemption is granted, or in the event of the military authorities drafting, detaining or arresting an exempted man for alleged noncompliance with these rules, or from any cause, the matter shall be brought before me as speedily

Mining in Kootenay, B.C.

By E. Jacobs.

With only half of the year gone, it is too early to venture an opinion as to what the value of the 1918 mineral production of British Columbia will be. There does not, however, seem to be any good reason to expect as large a total value for this year as there was for 1917; indeed, it will not be surprising to find that there will be a decrease that will show the optimism of some of those who have expected a larger value to have been without foundation.

It is quite likely the production of coal will be appreciably larger, but not of metalliferous minerals, neither placer nor lode. Nor is it to be expected that the total of dividend distributions of metalliferous mining companies will be as large as in 1917, for the amount declared for the first half of 1918 (\$1,345,796) is \$236,479 less than one-half of the total for 1917, which was \$3,164,550.

The chief metalliferous mining districts of the province are those of East and West Kootenay, Boundary, and the Coast. The outlook appears to be that so far as the Kootenay and Boundary districts are concerned, there will be a considerable decrease in the production of metals, except, perhaps that the output of zinc may be larger. If nothing shall happen to interfere with the continuous production of coal from Crowsnest mines, it may be expected that there will be an increase in the value of the year's output of non-metallic minerals that will in part offset the decrease in that of metals, but it is unlikely that it will wholly compensate for the latter.

Data relative to the output of all mines in Boundary and Coast districts is not usually obtainable until after the close of the year, so that any attempt to review conditions in those districts would, in the absence of such information, of necessity, be largely guess-work. It is believed, though, that there has been a falling-off in production in Boundary district; that there may be a similar result disclosed when the output of the metal mines of the lower Coast district shall be known, and that the upper Coast district will probably show an increase, which will be largely the result of the operations of the Granby and Surf Inlet companies. Without authentic data, though, to exhibit the actual position, the reference to the upper Coast mines should be regarded more as a surmise than as a statement founded upon definite knowledge of what the mineral production has been to date, and what it may be expected to be for the remainder of the year.

So much of the ore produced in Kootenay districts goes to Trail for treatment, that a far better idea of the situation can be given, for statements of the quantities received are published regularly, and these supply a basis on which to form an opinion as to whether there has been an increase or a decrease. The following summary review of ore receipts at Trail during five and one-half months of this year may be taken to indicate what the general results for the first half of 1918 have been:

Ore Receipts at Trail.—Ore receipts at Trail were not as large during the second quarter of the year as in the first similar period. As the figures available at the time of writing are only up to June 14, inclusive, complete comparisons are not practicable just now, but the following figures will be near enough to give a generally correct idea of the position in regard to

the quantities of ore received at the Consolidated Mining and Smelting Co.'s works at Trail. The monthly totals are as under:

Ore Received in 1918.	Daily Average.	
	Tons.	Tons.
In January	27,404	884
In February	33,989	1,214
In March	41,725	1,346
In April	37,039	1,235
In May	21,162	683
In June (two weeks only) . . .	8,222	587

The chief cause of the decrease was a considerably lessened production from the Consolidated Co.'s own mines. For instance, receipts of ore from mines at Rossland, by far the greater part of which comes from the Centre Star and Le Roi mines, owned by the company, averaged 770 tons a day for March and only 71 tons a day for two weeks of June; then East Kootenay mines, chief among which is the company's Sullivan zinc-lead mine, had an average of 225 tons a day for June against 347 tons for March, while Boundary mines shipping to Trail (the only important producer being the company's Emma mine) averaged but 38 tons a day in June as compared with 111 tons in March.

On the other hand, there was a distinct improvement so far as mines in Ainsworth and Slocan divisions are concerned. The total of Ainsworth mines for the months of February and March was 2,965 tons, while for April and May it was 5,004 tons. Slocan's total for February and March was 2,292 tons, and for April and May 2,884 tons, while for two weeks in June it was 1,368 tons. More ore come from United States mines, too, their February-March total having been 1,513 tons and that for April-May 1,731 tons.

It should be kept in mind that the foregoing figures do not include the whole production of the several districts included. While there may not have been any considerable quantity of ore shipped elsewhere from mines in East and West Kootenay districts, it is well known to those familiar with local conditions that the chief sources of ore-supply for the Boundary district copper smelting works, at Grand Forks and Greenwood respectively, are the mines of the Granby Consolidated Co. and the Canada Copper Corporation, the former having four blast furnaces in operation and the latter one or two.

EAST KOOTENAY.

Only one mine in East Kootenay district other than those owned by the Consolidated Mining and Smelting Co., during the period under notice, made an output of ore worth mentioning, namely, the Paradise, in Windermere division, which shipped to Trail 1,352 tons out of a total from the district of nearly 43,000 tons. Several small mines together shipped 79 tons, but with the exception of that from the Paradise, above mentioned, the whole of the remainder was from mines of the Consolidated Co., in the proportion of about 530 tons from the St. Eugene and 41,000 tons from the Sullivan, the latter quantity being of zinc ore except as to 229 tons which was lead ore. From time to time newspaper reports have been published, making it appear that one or other of several properties in the three mining divisions comprising the East Kootenay district—Fort Steele, Windermere, and Golden divisions—

the fact remains that the combined output of all of them, exclusive of the Paradise, which was reopened last year after many years of unproductiveness, has not this year reached to 100 tons of product shipped, and this notwithstanding that there is now a railway running through the district from north to south—from Golden, on the main transcontinental line of the Canadian Pacific Railway Co., to that company's Crowsnest branch in the southern part of the district.

WEST KOOTENAY.

It has already been shown that Ainsworth and Slocan divisions of West Kootenay have in recent months made a larger production of ore, while Rossland's output has dwindled until the figures for June show a most serious decrease. Not that Rossland mines have become exhausted, but that conditions are so unfavorable at this time for continuing the mining of ore in which the chief valuable content is gold that it has been decided to suspend for the time the production of such ore at the larger mines of that camp. Dealing with the several mining divisions separately the following comment is made:

Ainsworth.—Monthly totals of output in 1918 of mines in Ainsworth division, that is of ore or concentrate shipped to Trail, are as follows: For January, 584 tons; February, 1,319 tons; March, 1,646 tons; April, 2,255 tons; May, 2,749 tons; June (two weeks only), 963 tons; total to June 15, 9,516 tons. Of this total, about 5,200 tons was from the Consolidated Co.'s mines—from the No. 1 mine nearly 4,800 tons, and from the Highland 400 tons. The New Canadian Metal Co.'s Bluebell Mine, situated near the eastern shore of Kootenay lake, opposite Ainsworth, shipped about 2,700 tons of oxidized lead ore taken from a deposit opened between the surface and the deeper workings. The Florence Mining Co., operating on the west side of the lake, about two miles north of Ainsworth, shipped 680 tons, probably for the most part concentrate. The Bell, in the western part of the division, made an output of 255 tons of zinc ore, and there was shipped to Trail from the old dump of the Montezuma, on the south fork of Kaslo Creek, 106 tons. Seven other properties were shippers, with a combined output of nearly 300 tons; among them the Cork-Province group which is stated to now be better equipped for concentrating its lead-zinc ore and for maintaining an output.

Slocan.—Monthly totals of ore and concentrate, both lead and zinc, received at Trail are as follows: For January, 712 tons; February, 1,717 tons; March, 575 tons; April, 1,295 tons; May, 1,589 tons, and June (two weeks only), 1,368 tons; total, 7,256 tons. The larger shippers were the Standard, more than 3,000 tons; Surprise, nearly 1,200 tons, and Lucky Jim, between 1,500 and 1,600 tons. No information has been obtained as to what quantities the Standard and Surprise shipped to the United States, but since ore was received at Trail from the former during only three months of the half-year and from the latter only two months, it is thought that the figures just given represent only a part of the output of concentrates from the mills of those mines, respectively. The greater part of the ore and concentrate from the three mines mentioned had zinc as its chief marketable content. Quite recently it was announced that production had been suspended at the Lucky Jim mine, owing to expiry of contract previously in existence with the Consolidated Co.

In all there were nineteen shippers from Slocan district to Trail during the half-year, but only three, in

addition to those already named, made an output in excess of one hundred tons; these were the Galena Farm and Lucky Thought, both in the neighborhood of Silverton, Slocan Lake, and the Rambler-Cariboo, in the eastern part of the district.

Late news concerning Slocan mines includes the information that another important shoot of silver-lead ore has been found in the Standard mine, which for several years was the largest producer of silver-lead in the district; that there has been a similar recent experience at the Rambler-Cariboo mine, and that the newly-organized company which has acquired the Slocan Star mine has commenced development work in the lower levels of that mine. The Galena Farm mine is expected to keep up a steady production until weather conditions in the winter shall again bring about a suspension of operations.

Nelson.—This division continues disappointing so far as ore-production is concerned, its total shipments in 1918 to date to Trail having been less than 1,400 tons. As more than 800 tons of this quality was from the Consolidated Co.'s Molly Gibson mine, and 170 tons from the Monarch, near Beasley siding, it will be seen that the large area of country in the division south of the Kootenay river, with a total of less than 350 tons shipped to Trail, of which 319 tons was lead ore from the Emerald mine, near Salmo, has done very little in recent months to add to the mineral production of the country. It may be that the Yankee Girl, near Ymir has been shipping to other smelting works, but with that possible exception there does not seem to have been much, if any, ore mined outside of the comparatively small quantity received at Trail. It is not surprising that the several gold mines about Nelson, and in Sheep Creek camp, have not been producers, but there are copper properties in the neighborhood of the city from which an output was looked for. Reports have been published making it appear that more zinc ore had been opened in the Hudson Bay mine, near Salmo, but no particulars of results have been received for inclusion in this review. Little is heard now of molybdenite, discovered several years ago in the southern part of the division and for a time stated to be important. Generally, productive mining in Nelson division seems to have been at a low ebb in the first half of the current year. Nor does there seem to have been any important progress made toward the utilization on a commercial scale of the electrolytic zinc process at Nelson of which much had been heard prior to 1918.

Rossland.—There is little to add to that already written concerning mines in Rossland camp, where the Consolidated Co. is now making only a small production. The Le Roi No. 2, Ltd., however, is keeping up its output, having sent to Trail about 8,150 tons of ore in five months of 1918, which compares with a little less than 11,000 tons during the whole of its fiscal year ended September 30, 1917.

It is of interest to note that Mr. J. J. Warren, managing director of the Consolidated Mining and Smelting Co., was lately reported by a Vancouver newspaper to have stated that only development work was being done in the company's Rossland mines, with about 150 men employed. The newspaper report continued: "When asked if the provincial taxation legislation had had anything to do with the closing of the Rossland mines, Mr. Warren said there had been some talk about this, but the decision to suspend shipment of ore from the Rossland mines had not been influenced by taxa-

tion legislation, but was because operating costs had increased more than enough to wipe out the profit margin on gold-mining under present abnormal conditions and there had not been any appreciation in the value of gold. When normal conditions shall have returned, Rossland mines will be able to ship large quantities of ore with a fair margin of profit. The increased cost of coal and coke alone for each ton of ore treated was approximately 60 cents. Steel had doubled in price, powder nearly so, and labor costs had also gone up. The result was that a gold mine was now about the worst kind of mining asset for a company to possess."

Other Camps.—There is little productive mining going on in other West Kootenay camps, from the whole of which not much more than one hundred tons of ore has been received during this year. Several small properties in Arrow Lake division, others in Trout Lake, and still others in Lardeau, have sent small lots of ore to Trail, while in all three divisions some development work has been done. Now and again a report is published of something being done in Revelstoke division, but the only property in that part of the district that was among last year's shippers is not on this year's Trail list.

Upper Coast District of British Columbia

The British Columbia Department of Mines recently published a bulletin entitled "Preliminary Review and Estimate of Mineral Production, 1917," in which was printed preliminary reports on the six Mineral Survey Districts into which the Province has been divided. That on District No. 1, by Mr. Geo. A. Clothier, resident engineer, with headquarters at Prince Rupert, follows:

District No. 1 is the old Cassiar District and includes seven Mining Divisions of the Province, namely, Bella Coola, Queen Charlotte, Skeena, Portland Canal, Atlin, Stikine, and Liard. It has 300 miles of direct coastline, from Seymour inlet to Portland Canal, which latter forms the south-eastern boundary between Alaska and British Columbia. In this distance there are hundreds of islands, and thousands of miles of canals and inlets cutting into the Coast range, affording the best possible conditions for prospecting. Shipping facilities and transportation are, of course, ideal, and it is because of these natural advantages that the large mining companies operating on the Coast have engineers in the field in search of suitable properties. The prospector on the Coast has therefore the double advantage of comparatively easy prospecting and a ready market for a prospect of merit.

The district, in 1917, produced about 830,000 tons of ore, of which amount, all, except about 1,700 tons, was treated at the Granby Company's smelter at Anyox; this company producing and treating from its own mines alone about 812,000 tons, which includes the low-grade quartz mined and shipped to the smelter for flux. The important new shipper added to the list in 1917 is the Belmont-Surf Inlet Mines, Limited.

Bella Coola Division.

The Bella Coola Division has had no mining outside of a little prospecting and the recording of about forty mineral claims. The only portion of the Division which I was able to visit was Seymour inlet, to look over some iron groups. I examined two properties and found some

good surface showings of fine, clean magnetite, well located for economical production and handling.

Skeena Mining Division.

The Skeena Mining Division has made an exceptionally good record during the year 1917, due to the very successful operations of the Granby Consolidated Mining, Smelting, and Power Company.

It has added one more producing property to its list in the Belmont-Surf Inlet Mines. This company has expended upward of \$1,000,000 in purchasing, developing, and equipping the quartz property on Princess Royal Island. The placing of this property on a shipping basis presented some difficult problems, and credit is due to the staff of the company for the installation of the up-to-date plant now in operation, and which will be dealt with more fully in a later report. The concentrator was put in operation in October, and to date the company has shipped to the Tacoma smelter 700 tons of concentrates, which will give returns of between \$90 and \$100 a ton in gold, silver, and copper value. With the additional tube-mill now being installed, the mill will treat 300 tons every twenty-four hours, producing between 800 and 900 tons of concentrates a month. The flow-sheet is partly water-concentration and partly oil-flotation, the latter using the Belmont-Jones type of machine. The saving is from 92 to 94 per cent. and will be improved.

The company has also under option and development a very promising-looking property, with similar ore to and adjoining its present holdings. The management expects to ship a total of 1,700 tons this year.

There are several groups of claims in the immediate vicinity on which there are said to be fine surface showings, but which I was unable to examine on account of the heavy snowfall.

I have been reliably informed that up Khutze, Aaltanhash, and Klekane inlets, off Graham channel, on the mainland, are several promising surface showings.

About twenty-five miles from Hartley bay, on the north-west side of Douglas channel, the Drum Lummon Copper Mines, Limited, a Vancouver company, is developing a property which shows bunches of high-grade copper ores of chalcocite, covellite, and bornite in quartz, which itself lies in more or less regular bunches, replacing the granite on either side of a fracture-zone through it. They have installed a very serviceable small equipment of gasoline-engine and compressor which will run a couple of hammer-machines, also an engine and fan for ventilating. Development to date consists of 365 feet of crosscut tunnel to the vein and 59 feet beyond, with 104 feet of drifting on the vein. The drift shows continuous ore for the whole distance, pinching in places to a foot in width and widening to 10 feet. The face at present looks very promising indeed, being 10 feet in width of quartz containing disseminated high-grade copper sulphides which would concentrate probably 10 into 1, making a very high-grade product. I was unable to examine the surface on account of the snow. The Mines Department has assisted the company to build a wagon-road from the beach to the mine, a distance of about a mile. The property looks very promising and is just at the critical stage now, where the next few thousand dollars can be spent to the very best advantage. The company has just sent a trial shipment of about 8 tons to the smelter, of ore sorted from development work.

MILITARY GAS MASKS ARE NOT SUITABLE FOR MINERS.

Mining men who are familiar with the oxygen mine rescue apparatus used by rescue men at mine explosions have been making inquiries of the U. S. Bureau of Mines, Department of the Interior, as to whether or not the military masks worn by the soldiers as a guard against poison gas attacks would not be serviceable at mine disasters. The military mask is so much lighter in weight and therefore so much easier carried that the miners are wondering if they cannot be used instead of the heavier oxygen mine rescue apparatus.

In answering queries of this character Mr. George S. Rice, Chief Mining Engineer of the Bureau, has the following to say:

"Military gases which may be discharged from pipe, or in later usage through the agency of shells, are poisonous in character, and perhaps may be immediately irritating to the eyes and skin. On the other hand, these gases being discharged in the open air are rapidly diluted so that high concentrations are generally only momentary except in dugouts which must be cleared by fanning out. Moreover, there is never a material deficiency in oxygen.

"The mine atmosphere after explosions or during fires contains the highly poisonous carbon monoxide gas, one of the most difficult gases to absorb chemically, and may be in high degrees of concentration for a long period, and also, what is more important, there is usually so serious a deficiency in oxygen after explosions that even if there were no poisonous gas present a man could not live.

"It is self-evident, therefore, that the purpose of the military mask is to absorb the poisonous gases present and these gases are sometimes very complicated in composition and a great variety of them are used. The supplying of oxygen other than atmospheric oxygen is not necessary. On the other hand, the first requisite of the mine rescue apparatus which is used at the military front in tunneling operations compels the supply of sufficient oxygen, viz.: 20 per cent. of the atmosphere and the exclusion of high concentrations of gases. Hence the necessity of having the apparatus self-contained, shutting off all the external atmosphere.

"It may further aid in explaining the situation to state that very large numbers of the regular oxygen mine rescue apparatus are being used both by the enemy and the Allies in tunneling and contra-tunneling operations as well as other special purposes.

"A third service requiring special apparatus is the Aviation Service. There are no poisonous gases to contend with, but the need is for oxygen to supply the deficiency at high altitudes.

"It will, therefore, be seen that so far as mine rescue and mine recovery work is concerned it is idle to consider that the military masks could be used as a substitute; they are of no value for the purpose, although with certain changes a commercial form may be developed which may be adaptable for use in special gases or vapors in metallurgical plants. Mr. G. A. Burrell, of the Bureau is now working out the problem of such a commercial mask, but it must be understood that special absorbents will be required for special gases, which calls for a knowledge of the exact atmosphere in which the men who would use the masks would work."

MAY DEVELOP CHROMITE DEPOSITS IN B.C.

There are indications that some of the chrome deposits of British Columbia are to be developed, Walter

J. Nicholls and associates of Spokane, Wash., being authoritatively reported to have secured control of claims situated at Cascade, B.C. The property is reported to have been purchased after an examination and report by George Crerar, a mining engineer of Spokane. The chrome of Cascade has been the subject of report by the Provincial Mineralogist, the deposit to which he refers, which no doubt is the same as that in question, being within 4,000 feet of the C.P.R. and in the Grand Forks Mining Division. Of this, Mr. P. B. Freeland, resident engineer, said last year: "Little development done. Ore in lenses carrying 30 to 50 per cent. chromium. Worth investigation. Had 250 tons on the dump, and were trying to get permit to ship. Associated serpentine rock carries 3 to 10 per cent. chromium." In view of the rush call for chromite by the Imperial Munitions Commission, and the consequent increased interest in the mineral in the Province, it is interesting to recall that Mr. W. M. Brewer, resident engineer at Nanaimo, B.C., reported in 1915 that chrome ore exists on Scotty Creek, near Clinton, B.C. The claims, he said, had been staked but abandoned and then re-opened. Little development, however, had been done. Selected samples ran 33 per cent. chromic oxide. Some low grade ore might be concentrated, but development was not such as to admit of an estimate of the quantity.

BRITISH COLUMBIA MINING DIVIDENDS.

The five leading mining companies of British Columbia, according to an authoritative compilation, have declared dividends for the first half of the year 1918 as follows:

Granby Consolidated Mining & Smelting Co.	\$749,924
Canadian Consolidated Mining & Smelting Company, Trail, B.C.	523,872
Howe Sound Company (Britannia Mine)	198,415
Hedley Gold Mining Co.	96,000
Crow's Nest Pass Coal Co.	62,126

The Britannia mine, as represented by the Howe Sound Co., leads in the ratio of dividend to capitalization, its dividend rate being 5 per cent. per quarter, or 20 per centum per annum. Granby leads as the largest dividend paying mine in British Columbia, its dividends declared to date having aggregated \$10,198,895. Both Granby and the Consolidated Mining & Smelting Co. pay dividends at the rate of 10 per cent per annum.

The Molly Gibson-Burnt Basin Mining Company is sending supplies and men out to their property at Paulson with a view to putting the mine on the shipping list in the near future. For the present ore will be hauled over the wagon road three and a half miles to the railway. The formation and character of ore is similar to that of the Rossland camp, gold being the principal value.

At a meeting of the Board of Directors of the American Institute of Mining Engineers, it was decided to drop all enemy aliens from membership. The meeting, which was under the chairmanship of Sidney J. Jennings, President of the Institute, was attended by twenty-three of the twenty-five directors, among them the Chairman and four members of the Naval Consulting Board. The action of the Board of Directors is said to affect the status of twenty-one German scientists and one Austrian professor, who held either honorary or active membership in the Association.

Lessons From The War*

By Eugene Schneider.

I should have scrupled to accept the Presidency of the Iron and Steel Institute, aware as I am that my personal merit does not suffice to make me worthy of that very high honor, and that a far-distant residence renders it difficult for me to discharge the responsible duties of the office, had I not understood that, prompted by a sentiment for which I am deeply grateful, you wished, in selecting my person, to emphasize the absolute, hearty, loyal no less than thoughtful and resolute union existing between Great Britain and France.

Your kindness has given voice to the thoughts that we share in common. United by mutual sacrifices, bereavements and hopes, we intend to remain undivided in victory. My hearty desire, as President of the Iron and Steel Institute, is, with the cordial assistance and support of both my predecessors and my colleagues on the Council, to draw still closer the economic bonds uniting our two countries; the unbroken development of such an alliance tending in the most efficient manner to disappoint our enemy in his insatiable lust of conquest.

Nor does it seem to me without profit, in order to prepare for the coming struggle, to seek even now in the tragic examples of the war for reasons and means of doing better than we have done hitherto.

Science and Industry.

Two years ago Sir William Beardmore told us, in his address, how the war had a long series of lessons to teach us, in the most varied provinces, ranging from ethics to politics and industry. In the last-named province, Sir William showed how scientific co-operation, that is to say co-operation between laboratory research and manufacturing development, is one of the questions most emphatically thrust upon us by the events that we have been witnessing, and one demanding as prompt as possible an answer, in view of our industrial destinies after the war.

I believe that the greater number of the industrialists interested in the manufacture of steel or any kind of manufacture in which the material used is steel or iron, on either side of the Channel, share Sir William's views. But the difficulty of the question certainly does not lie in the generalization of these views; it seems to me, on the contrary, to reside in defining clearly the connection to be established between two groups of men who, up to now, have had few direct relations; the scientists on the one hand, and the industrialists on the other.

In the definition we are seeking for, difficult problems of organization are involved; for a solution may be considered as satisfactory only inasmuch as it realizes a complete harmonious balance between the different forces which we are using to obtain the sought-for results. Some are connected with the efforts of individual enterprise; others are the outcome of collective action, duly disciplined and, as it were, codified, and of the rational use of habits and traditions. We have no right to neglect that inheritance of the past. We should, on the contrary, in rearing our new fabric, avail ourselves, to the best of our ability, of any material at hand, provided it be serviceable.

We must first make sure that our future organization is so skilfully contrived as to provide individual enterprise with an open field broad enough or, as a mathematician would say, with a high enough degree

of liberty. Industrial or scientific invention is, indeed, in almost every case, the product of a creative power in an individual endowed with active imagination. To quote an example, it is beyond doubt that we owe to the personal exertions of Henry Bessemer the manufacture of steel in a converter and also to those of Nasmyth (in England), and Bourdon (at Le Creusot), the invention of the steam-hammer.

However, science and industrial technique are both growing ever more complex. It is increasingly difficult, even for an exceptionally endowed mind, to store up, digest and finally use the mass of human knowledge contained to-day in one of the numerous branches that have sprung up on all sides out of the common stem formed by the discoveries of the scientists, engineers and industrialists of the later nineteenth century.

Our engineers, scientists and members of our industrial staff have less and less the possibility of getting at the knowledge of facts by direct observation and thus apprehending them in their reality; they must often needs accept ready-made doctrines and live in a world of theory. There lies the main danger, especially in a time such as the one we live in. The fate indeed of our industry depends on the right use of the "human material" we may have at our disposal, to the training of which we shall have to attend; and we must therefore solve, at the shortest notice, the most complex problems that have ever been set before man: I mean, we must discipline labor in both our countries, so that our different industries, at which war and the economic consequences of war have struck and will strike heavy blows, may recover their balance with the shortest possible delay; while we make sure in spite of that indispensable discipline and the extreme specialization it involves, that we are recruiting powerful individualities whose exertions are necessary to progress.

In that respect, the iron industries form the basis of the gigantic fabric we are to rear; they are, so to speak, the gauge of industrial prosperity in a country, since whenever industry expands there is a demand for plant, and recourse is always had to metallurgy to develop plant. I may add that metallurgy is also the protecting shield that allows our two nations to resist the onslaught of German imperialism, and that it plays such an important part in the tremendous struggle, that few people realize it exactly, outside those who are in familiar and everyday contact with the real facts.

Important Role of Metallurgy in the War.

Of course, almost everyone knows that the present war requires a far greater quantity of metal than any preceding one; but it seems to me that it may be interesting to enquire into certain of the more hidden causes of this new condition and into some of the consequences necessarily entailed, all the more so as this enquiry will provide us with concrete examples, calculated to expose the parts played on the one hand by scientific research and invention, and on the other by industrial organization.

It is certain that the expenditure of ammunition exceeded, at the very outset, all anticipations founded on comparisons with previous campaigns. This circumstance appears to be due to stable, unbroken fronts, rendered possible by the huge number of men in the field. Military operations, under those conditions, assume, with few exceptions, the character of a siege-war.

* Extracts from the Presidential Address, Iron and Steel Institute, London, May 2, 1918.

The two enemies invest each other, and can effect no very ample movement unless part of the continuous rampart they are besieging or defending be previously broken through. As that rampart is not a mere line of walled defences, but is constituted in fact by an extensive area where is to be found a sporadical system of great depth formed by tier upon tier of varied works and guns of all sizes, one may well understand that, to neutralize a sector in view of an infantry attack, necessitates the expenditure of a greater number of shells than when the object, as formerly, was simply to demolish or fire a few houses in two or three villages. Instead of the 20,000 gun-shots with which Napoleon won the battle of Wagram, or the 1,500,000 shells that the Siege of Sebastopol cost the Allies, we must fire to-day several million shells to drive the enemy a few miles back on a very narrow front.

This, after all, is due to the fact that the accuracy of our gun-fire, and the high power of our explosives, are held in check by an adequate organization of the shelters afforded to the infantry, the size of the targets being reduced to a minimum.

The principal cause, apart from the difficulty of finding the range, of the present huge expenditure of shells is that the increasing accuracy of our guns has not been sufficient to counterbalance the diminished vulnerability of the objects aimed at.

Our artillery engineers, left to their own inspiration, and confronted with this fact, have certainly been tempted to seek for the solution in an improvement in the accuracy of their guns.

The problem is of profound technical interest. But, before grasping the solution, how many varying factors must we take into account: the laws bearing on the combustion of gunpowder; the effect of priming; the transmitting of pressures in a gaseous mass in motion; the particular effects when the shell is near the muzzle; the effects of the flexibility of the gun and the gun-carriage; the varying resistances due to the varying directions given to the shell, etc.

The work may and must be done; but it will take up a considerable time, for how many erroneous theories will crop up in the minds of the enquirer before they hit upon the royal road leading to the desired result, that is to say, to the lessening of differences in muzzle velocity, angles of elevation, and disturbing motions in the projectile during its flight?

To a common-sense man it plainly appeared that to carry on such researches exclusively was out of season, and that we must provisionally admit, as a necessary fact, an expenditure of shells deemed until then impracticable, and find, in the use of improved methods of manufacture, the immediately indispensable resources.

New Metallurgical Plants at Creusot and Caen.

Accordingly, I resolved to build new metallurgical plants at Le Creusot and Caen, with the view of producing a considerable tonnage of steel projectiles in the form of rolled bars, and of transforming directly all or part of the bars into nosed and heat-treated projectile blanks ranging from the 75 mm. calibre upward (370, 400, 520 mm., or 15, 15.75, and 20.5 inch respectively).

No doubt such metallurgical plants, situated far from our mining districts of the North and of Lorraine, will suffer from certain industrial reactions when peace allows most of our ironworks in the East to begin to work again. But I thought it permissible to neglect those future difficulties, in order to contribute to the defence of our allied countries to the utmost of my

capacity. Moreover, I do not think it impossible that the metallurgical future of France will afford the means of procuring a satisfactory prosperity, not only to the ironworks working with the ores of Lorraine, but to such as receive their supplies from other districts of our country, provided, of course, that the manufactured products are adapted to local conditions of extraction, fuel, and motive-power respectively.

Together with other French friends, we proceeded to build powerful blast-furnaces, and steel works equipped with 60-ton open-hearth furnaces, and this effort has enabled us to provide our armies with the necessary projectiles, in spite of the enemy holding more than 70 per cent. of our iron and steel works.

A similar question is raised with regard to deterioration in the inner tubes of guns. The intense firing to which they are subjected more or less quickly erodes the junction cone and the grooves of rifling, so that the accuracy and range decrease in a continuous manner, and a gun is useless after firing from 10,000 to 2,000 shots, according as it is a small or large calibre gun.

The engineers and ballisticians have naturally sought to reduce the effects of deterioration by a study of the very complex causes, the temperature of combustion of the powder, the maximum pressure, the calibre, etc. But it is evident that, knowing so little as we do about these things, the solution of the problem remains remote, and that, had we managed by laboratory experiments, to fix upon a quality of metal capable of withstanding the special erosion of guns, it was practically impossible to make the guns in course of manufacturing benefit by the discovery. We therefore took for granted deterioration, and consequently provided for the manufacture of spare tubes of guns.

Does this mean that we systematically avoided research? Quite the reverse, but we began by tackling problems admitting of an immediate solution, so to speak, and among the latter, above all such as tended to increase production. I am convinced that such a policy will have to be pursued still more strictly after the war.

So we have built in France extremely powerful plants for the manufacture of cast-iron or open-hearth steel. The Caen blast furnaces are to turn out, per unit, 450 tons per day, whereas, before the war, out of 123 such furnaces at work in France, but a few could turn out 250 tons. My new steel-works at Breuil, near Le Creusot, are equipped with 60-ton open-hearth furnaces, whereas the 30 to 35-ton type was already considered as very powerful.

Moreover, we are endeavoring to manufacture special high grade acid open-hearth steel for aeroplane motors and more generally for machinery intended to bear very high stresses and the results hitherto attained show that success is ahead. It is in that direction that our laboratories are working. It is not a question of merely finding some new metal, as the result of the skilful alloying of iron and rare metals, but on the contrary we are studying means for controlling the open-hearth process as securely as the mere melting in a crucible.

It would be tiring to review here all the questions we are now asked to solve. Perhaps, however, we may be allowed to select two more instances, in illustration of our idea of the part to be played by the engineers whose exceptional gifts help our technique to progress.

The greater part of the steel-ingots we are to produce will go to the rolling mill for conversion into bil-

lets or merchant bars. Hitherto, the different operations in the rolling mill department, and in particular the drafting of grooves on the rolls, had been left to the care of men of experience, no doubt, but who were guided by empirical notions based a little on tradition and much on sentiment. The manufacture of projectiles showed us the benefit to be obtained by a thorough and scientific study of the problem of hot-drawing of blanks or slabs. It is enough to say, for instance, that, with a properly selected speed of rolling, section of dies, piercing punches, drawing rings and punches, we are able to draw in one heating the largest projectile (520 mm. (20 15/32 inches) Schneider mortar) and to use in the process half as much power as was formerly deemed necessary.

To realize such a reduction of power in the rolling-mill department is, from an economic point of view, extremely interesting, but it is necessary to study methodically all the phenomena taking place during the various stages of rolling at the cogging mill and finishing mill. We must acknowledge that engineers in certain countries, had, if not anticipated us (for research had begun at Le Creusot as early as 1899) at any rate got ahead of us. The work of some of them is certainly calculated to give a sound basis to a really practical study. It is necessary, if we wish the rolling-mill department to profit by it, for younger engineers, having the requisite scientific equipment and eager to solve an interesting industrial problem, to attack it without delay.

They have a starting point: the empirical rules of those that preceded them. These must absolutely be taken into account. They have at their disposal the means of measurement furnished by the electric motors of our mills and all our laboratory apparatus, pyrometers, extensometers, etc.; they must needs reach the goal.

When we represent, on a diagram, as functions of the number of passes, the values of the sections of the rolled product and of its chief sizes, we are often surprised that the points thus obtained do not form continuous curves, when we know very well that, special steel being excepted, the tenacity of carbon steel varies in a continuous manner as a function of the temperature. The simple readjustment of the curves thus obtained often conduces to a decrease in the number of passes, and to a better distribution of the power. It is obvious that the profit to be reaped from the study will be immediately felt.

Defective Heating is Inexcusable.

I should like to say a word about another problem of an industrial type destined to be solved by our most skilled engineers. It is that of heating: heating industrial furnaces, heating boilers. It is an extraordinary fact that the art of making a fire and turning it to a good use is still in its infancy and that our heating apparatuses are often very crude.

We know the laws of combustion, gasification, radiation and convection; but many builders of furnaces go on copying old models instead of investigating the working of their apparatus. How many times have we not heard that a cast of open-hearth steel had gone wrong because "the furnace was not properly heated."

I lay down as a principle that an open-hearth furnace should always work well. If the defect in heating is due to the choking-up of the regenerators, we must manage to get the dust to settle and allow, if necessary, the addition of heat over the top of the bath, with the aid, for instance, of oil-burners or any other process, such as the use of a cleaner of some artificial draught;

for how can we admit that we cannot provide against an inconvenience which has been removed elsewhere?

If the defect in heating is due to the exceptional poverty of the gas, we must dispose of the means to better it, and these are numerous. In short, a systematic study of steel-furnaces will certainly lead to the remedying of many weaknesses in design and construction so that we may control their working and be as sure of their temperature as a stoker is sure of the pressure of his boiler.

The metallurgical works of the future must no longer afford the picturesque but regrettable sight, still too frequent to-day, of a crowd of chimneys all emitting an abundance of black or white smoke. The latter is steam. Perhaps apart from locomotives, no engine should emit steam in the open; the recovery of the calories contained in waste steam expanded to atmospheric pressure and at a temperature of not more than 30° C., yields a power at least equal to that produced by the prime mover itself. This we have determined experimentally on the exhaust turbines driven by the steam winding machines in use in some of our collieries. Even the steam of our hammers can be utilized whenever there is a workshop with a large number of moderately-powerful engines.

The black smoke is the result of badly-constructed furnaces, or of insufficient discipline in the personnel of stokers. The latter may be remedied in a simple automatic way by the institution of a bounty system calculated according to the number of charges, as shown in the deprimometer. As to the building of furnaces, great improvements might be effected by the systematic application of a few well-known results of industrial physics. We may perceive, here, under one of its characteristic aspects, the question of "industrial output" as opposed to "mechanical output." In the greater number of cases, it is possible to represent by a figure the useful effect of some isolated engine or thermic apparatus; but the useful effect of a metallurgical plant is a function of a far greater number of variables, including at the same time measurable quantities of the physical order and "imponderables," such as the technical value of the personnel and their moral qualities.

The time is at hand when our works must yield their maximum useful effect, and, therefore, we should give all our attention to any loss, even those which formerly appeared negligible on account of their comparative smallness. Multiplied by the enormous tonnage of our future production, they will form a considerable total. For instance, the mere recovery of waste oil in a vast metallurgical works may give rise to a not inconsiderable profit.

Right Use of Sources of Heat and Energy of Each Country is a State Affair.

But those are the minor aspects, one might say, of the question. More exactly, the problem of the industrial output may be studied from different points of view, the first of which is certainly a right use of the sources of heat and energy at the disposal of each country. That is a veritable State affair, concerning the whole community. In particular, with regard to ourselves, France does not dispose of a stock of mineral fuel corresponding to her wealth of iron ore. In 1913, whereas 23 million tons of ore were extracted, her native coal mines provided only four million tons of metallurgical coke, which, together with three million tons imported coke, made up merely the seven million tons necessary to her production in cast iron (five million tons).

It behoves us, therefore, to cast up the account of our resources in hydraulic power, so as to reserve for metallurgical purposes the greatest possible part of our coal production. Those resources may even now be easily appropriated for the traction of trains and tram cars, lighting purposes, and the distribution of driving force over extensive zones, since a 60,000 voltage is in use, and one of 120,000 voltage will be so very soon. Whereas the water-falls now utilized yield only from 700,000 to 800,000 H.P., future plants should allow a yield, at low water, of a minimum of 4,500,000 H.P. And as 1,000 hydraulic H.P. economize per year 10,000 tons of coal, in round numbers, the profit to expect from those plants will rise to 30 million tons, that is to say, a figure approximating our total coal extraction before the war.

Metallurgical and mining industries are interested in this question not only indirectly in the way we have pointed out, but also directly, by the use of hydro-electric current to control engines and even to produce metal.

The engineer's task, as we conceive it, begins here in an endeavor to combine harmoniously the use of thermic power as produced by the blast-furnace and coke-ovens, and hydro-electric power; the latter having the defect of being transmitted by very long lines exposed to many risks. It will, therefore, be well to provide very powerful thermic generating sets, ready for running at a moment's notice, capable of carrying on the work in the chief departments, pending the time when the thermic emergency stations have brought up to a maximum figure their normal reduced power.

That part will devolve upon groups worked by Diesel motors of 2,000, 4,000 and even 6,000 H.P., the price of oil-fuel being, in that case, a negligible matter. We are studying in France such motors and their realization seems assured.

Direct Use of Hydraulic Power.

Hydraulic power will, in certain cases, be directly utilized in our metallurgical works, without previous electric transformation. Workshops turning out projectiles have already been equipped with hydraulic presses worked directly by water forced at high pressure through pipes. More powerful presses may be worked in a similar manner, and even rolling mills might be driven by high-pressure hydraulic turbines, transmitting their energy, in the case of reversible mill engines, through the medium of a Föttinger transformer. May I recall here that a similar installation was realized by us several years ago at the Terni steel works for the manufacture of armor-plate (the power-transformer being electric).

The Electric Furnace.

The electric blast-furnace is not yet widely used in industry, but the development of electric furnaces destined to the production and refining of steel is certainly assured, especially in works using hydro-electric current as motive power. It is likely that various combinations of the electric furnace with the Thomas converter or the basic open-hearth steel will in future be the characteristic feature of that special iron metallurgy which is the necessary consequence of a dual source of heat. It will be the topography of the region or more exactly the place of the works on the "electric map" of France that will determine the proportionate demand to be made from either of the two sources.

Those are entirely new vistas opening up before our engineers. Nor should they, on that account, forget the questions of internal organization, more immediate and more varied in their form.

Union of Empirical Knowledge and Scientific Research.

Some say pure science is disinterested, or, in other words, indifferent to results; that its goal is the truth, the pure, simple, naked truth, and that it is pursued for the pleasure of the pursuit; like a sportsman who enjoys the pleasure of a day's shooting but who is indifferent to the game he bags.

This is perhaps exaggerated. At any rate, the aims of the metallurgist are more practical; he too aims at scientific truth, but a truth which can be applied to some useful end; he is not like the pure scientist, all indifferent to the game he bags. I am convinced, also, that in no other branch of industry can the union of empirical knowledge and scientific research be attended with better results than in that of metallurgy.

The opinion is no doubt excessive. For my part, I am inclined to think—and I believe I have shown you on what facts my opinion is grounded—that our metallurgical industrialists can derive much profit from scientific research, on condition that the questions are stated and treated in the proper manner—that is to say, in taking into account the results already attained, regardless of their origin, however empirical it may be, and, above all, in limiting the field of research to the immediately realizable object in view.

It was certainly to suggestions such as those that I have just outlined that the foundation of the National Physical Laboratory was due, and we cannot help wishing that this magnificent institution may completely fulfil the purpose that seems to be at the basis of all general progress in contemporary industry, and, above all, in metallurgy—namely, to establish and maintain a harmonious balance between the efforts devoted to disinterested general scientific research on the one hand and those spent in the pursuit of immediately utilizable results in the vast and varied provinces of technology.

It is certain that this balance is a function of the particular genius of each nation, and that, even if an organization similar to the National Physical Laboratory was founded in my country, the part played by that institution in our industrial and technical development would be quite different from that which it plays in Great Britain.

Whereas, indeed, our French engineers and scientists are still imbued with the classical bias obtaining of old among us, and always seek to realize their scientific ideal by setting up doctrines of unexceptionable symmetry in accordance with the strictest rules of Cartesian logic, the British engineers and scientists, having outgrown that too rigid and geometrical discipline, more often obey the call of their independent imagination. The results thus attained constitute a vast province extremely varied in aspect, but it is plain that it is more than ever indispensable to sacrifice a little of the picturesque, and to set bounds to that splendid riot of individual enterprise, not with the view of marshalling individual minds in due order according to the German methods of work, and then stripping them of all spontaneity; but only to realize a unity of purpose necessary to their right use and quite consistent with the free play of each mind.

With regard to us French people, we must guard, not so much against the excesses of our scientific imagination, as against our exaggerated love of generalization and of what we call "pure science," to which we are always tempted to give up the seat of honor even at the cost of neglecting a little too much technological researches which are, after all, those alone whose results are of immediate benefit.

I am afraid that I shall appear most exacting to our younger engineers, fresh from college, and fired with enthusiasm for the "scientific sport" that they have practised for many terms, and even more so no doubt to older scientists inured to disinterested research. But I am convinced that I am in the right, and I should be most happy to bring some of you to share my opinion, for a close collaboration of scientists and metallurgists on both sides of the Channel is certainly one of the chief factors in the rapid restoration of the balance of the world so gravely disturbed during the last years by the folly of German Imperialism.

FURTHER AID FOR FRENCH REDUCTION CO.

Legislation was introduced to the British Columbia Legislature of 1918, recently prorogued, giving the Government power to guarantee the bonds of the French Complex Ore Reduction Co., Ltd., to the extent of another \$25,000. The Province already has endorsed this company's issues up to \$40,000. With this capital a plant has been erected at Fairview, B.C., near the city of Nelson, which has been equipped especially for the handling of the peculiarly fractious zinc-lead ores of the Slocan District by means of the French electrolytical process. The cost of plant, however, so exhausted the company's financial resources that it was unable to enter into the custom business on such a scale as to defray overhead expenses and keep ahead and it became necessary to close down. The position was aggravated by the fact that with the phenomenal rise in the quotations on both zinc and lead, following the outbreak of war, the Consolidated Mining and Smelting Co., of Canada, the largest smelting concern of Western Canada, was enabled to install an electrolytical process and to handle the silver, lead and zinc ores of the district. Under these circumstances the French Complex Ore Reduction Co. was compelled to cease operation, but its management is looking forward to the time, which in its opinion seems to have practically arrived now, when the Trail company will be unable to pay the prices it has been giving, and when its cheaper process will be able to demonstrate its value. It is claimed for the French process that it is capable of recovering from 90 per cent. up of the zinc contents of these ores, and that it can be run at a profit when the quotation on zinc falls to 5c. per lb. or thereabouts. The Government, having placed its credit behind the company in the first instance, has indicated, by the legislation referred to and which, no doubt, will be passed, that it is prepared to give the company and its process every chance to "make good."

The Western Fuel Company produced 29,967 tons more in the first three months of 1918 than in the opening quarter of the previous year; the Nanoose Collieries show an increase of 9,172 tons; while the output of the Canadian Collieries and the Pacific Coast Coal Company has fallen off slightly. This, however, is expected to be more than offset by the opening of two new mines, which now are being developed and equipped, one at South Wellington, by the Canadian Collieries (D) Ltd., and the other at Cassidy's Siding, Vancouver Island, by the Granby Consolidated Mining, Smelting and Power Co.

In the Crow's Nest District, the Crow's Nest Pass Coal Co. produced 24,708 tons more in the first quarter of this year than in the first months of 1917, while the Corbin Coal and Coke Co. also has increased its production to the extent of 8,716 tons.

Training of Metallurgists in Schools and in Metallurgical Works*

By H. C. H. Carpenter.

Non-ferrous metallurgy may be divided into two main parts which are quite distinct and well defined. One begins where the other ends. The first may be described as ore-treatment, and its field of operations is the extraction of metals from their ores. It may conveniently be regarded as having fulfilled its function when a marketable metal or alloy has been produced. The second includes the working up of the raw merchantable products of the first by mechanical processes into a variety of finished materials, the founding of alloys, their mechanical and heat treatment, etc. On the whole, while I do not think that there is any generally accepted designation for work of this somewhat composite character, the term metallurgical engineering seems to me to encompass it with sufficient accuracy.

Training in Schools.

The function of the technical school or university to which intending metallurgists come from secondary or higher grade school is (1) to provide the necessary training in the fundamental sciences, physics, mechanics, chemistry, physical chemistry, mathematics, geology and mineralogy, and this should be done before any attempt is made to give any instruction at all in any of the applied sciences. For these two years are necessary. (2) On the above foundations should be raised the structure of the knowledge of the principles of the applied sciences: fuel (including refractory materials), metallurgy, both ferrous and non-ferrous, the strength of materials, power production, and applied electricity. For these two more years will be needed. (3) Every attempt should be made—and made as soon as the students have reached the necessary standard—to get them into the way of acquiring knowledge for themselves, of testing its reliability—and, generally speaking, to instil in them habits of independence of mind, resourcefulness and initiative. I doubt whether the teacher at any educational institution of the kind referred to can render a greater or more absolutely fundamental service to the student who contemplates entering a works, than to awaken and strengthen in him the capacity to acquire knowledge for himself, and to be able to judge when he has acquired it, the precise degree of reliability attaching to it. Whatever the circumstances with which such a man may be faced, and however difficult it may be for him either to act or to give his opinion when called upon to do so in any given situation, if he has this twofold quality—the power to acquire knowledge and the capacity of estimating just how much weight should be attached to it—he will nearly always be about right, and he will certainly never be far wrong. Both these qualities are really indispensable—the one creative, the other destructive in its operations. Each has its function; neither is complete without the other. The necessity for the former is self-evident; but it may be thought that I am unduly stressing the importance of inculcating the habitual use of the critical faculty. May I therefore recall to you the words of one of the noblest and most successful workers in applied science—I refer to Pasteur. Speaking on the occasion of his seventieth birthday to colleagues and pupils at the Institute which bears his name and was founded in his honor, he used these memorable words, which have been

*Extracts from Presidential Address, Institute of Metals, London, March 13, 1918.

more helpful to me in my scientific and technical work than any others that I can call to mind: "Cultivate the spirit of criticism. By itself it is neither a generator of ideas nor a stimulus to great things. Without it nothing will avail. With it will always remain the last word."

To my mind, then, these three elements of training—a sound and broad scientific foundation, an adequate superstructure of knowledge of the principles of metallurgy and cognate branches of the arts and the applied sciences, and the awakening and development of the mental characteristics just touched upon—are what a technical college or university should concentrate upon. Less than this would involve the omission of some essential element of training, more than this it would be unwise to attempt, for it could only be successful with students of unusually high ability, and they can always be relied upon to make good whatever their training. How can these aims best be achieved? I can, of course, only discuss the matter in general terms, and in what follows may I ask you to remember that I am simply endeavoring to contribute something from my own experience that may be worth stating.

Educational influences—using the term in a very broad sense—as a rule operate on the student in the following ways: (1) By contact with his teachers; (2) by contact with his fellow-students, and (3) by the discipline of laboratory work and other ways in which the essential principle is that he has to make the efforts himself. Let me review these briefly.

No. (1) will no doubt at once suggest lectures, and these, though they do not exhaust this category, are at any rate an important feature of it. Are lectures really necessary? To some, no doubt, it may appear that as there are good text-books on the most important aspects of metallurgy, and a vast number of original papers, all that is required is to see that the student studies a proper selection of these. The mere imparting of knowledge, however, such as can be found in text-books, is not, in my opinion, the function of a lecturer. If the student—particularly at the beginning of his specific metallurgical training in the third year, such as I have presupposed—could really master original papers, and especially those dealing with intricate and disputed points of theory, and if he could weigh the evidence as he reads, I should agree that the case for lectures was very much weakened and that their necessity was open to question. But this is just what most students cannot do and what they require training in, and from this point of view lectures constitute a valuable instrument of education. In an hour's lecture it is possible to bring to a focus a wealth of considerations bearing on some given point of theory or practice, and thus to put before the student an aspect of the subject which so far as I know cannot be presented in any other way; and if the lecturer is successful, he will have created in the student's mind—I am, of course, assuming that the student is a willing accomplice, a condition that does not always hold good—a new point of view such as will cause him continually to use his mind on it—in a word, that will make him think, that rare and most precious of happenings. Once this habit is achieved—sometimes it is never achieved—lectures do not require to constitute so large a part of the student's education, and therefore in his fourth year it should be possible to diminish them. In this case they can advantageously be partly replaced by the less formal colloquium in which the students themselves largely take charge of the discussion of problems and important questions. The value of this training in

arousing habits of independence of mind, criticism, and the exercise of judgment is so obvious as to require no elaboration.

(2) That students can and do educate one another is the experience of any teacher who takes the trouble to observe it. This is obvious in a variety of ways, and certainly shows most markedly in successive examination tests. The difference in standard between succeeding years of men is sometimes astonishing, and I have always found that the high standard years are attributable to the influence of one or more students of unusual ability who have raised the level of the remainder. I am not suggesting that this is consciously done on their part—I do not think it is. It occurs simply as the result of the normal intercourse of men who are working together and competing against one another for such a period as four years; and I must say I regard this as one of the most valuable results of the educational system that we have.

(3) Experimental work in the laboratory, if properly chosen and carried out, is a most important—indeed an absolutely essential—element in the training of metallurgical students. It constitutes, in fact, from the point of view of the time taken, much the largest part of the training. I have said it must be properly chosen, because if it is to exercise its maximum educational effect, either it must be related as closely as possible to the principles enunciated in the lectures or the matters discussed in the colloquia, or it should be designed with at any rate some particular end in view. There is, if I may say so, a tendency to make analytical work too prominent a feature of laboratory training. The educational value of a training in accurate quantitative analytical work I should be the first to insist on, but analysis is seldom an end in itself. It is a means to an end, and this is apt to be lost sight of. And the fact that the view is held in many works that the only thing a metallurgist who comes to them from a technical college or university can do is to analyze—and not always that—is a well-justified criticism that we teachers should take to heart and do our best to remedy. What is required, in my opinion, is a course of practical work so chosen as to exemplify and give rigorous training, on the one hand, in the principles of metallurgical processes, and, on the other hand, the testing of metallurgical theories. In such a course analytical methods have their due—but not more than their due—share, and the student gets into the way of viewing analysis in its proper place and proportion. There is to-day an urgent need to see that the training in physical and physico-chemical methods of testing and investigation is the very best that can be devised. Metallography, the testing of materials, and chemical analysis are the handmaids of our industry, and the role of the first named becomes more important every year.

Training in Metallurgical Works.

I have sketched, all too imperfectly and briefly, the broad principles of metallurgical training such as, in my opinion, should be given at educational institutions, and the underlying principles of methods by which such instruction can advantageously be given. I have said nothing as to the training that the student should get in the works itself, and I propose to touch on this aspect of the matter only very briefly, because here my responsibility ends and that of the works begins. The few remarks I am going to make are in the nature of an appeal to the management of the works into which the students enter.

I think the most suitable period at which to link up the training given at the educational institution with that of the works is at the end of the student's third year at the former. By this time he has had instruction in the fundamental sciences and a year at his professional subject, and he should have acquired something of the habits of judgment and independence of mind upon which I have laid such stress. He ought, therefore, to be ready to appreciate what he sees and get some value out of it. He has a three months' vacation, and this time can most advantageously be spent at a works. There is generally little or no difficulty about arranging this, and my own students do it regularly. They then return to their fourth and last year of study at the educational institution with, at any rate, some idea of the kind of work that awaits them at the works, and this should give a reality particularly to the character of the practical work in this year which would otherwise be less vivid. It must be emphasized, however, that the three months' period referred to cannot do more than familiarize in a very general way the student with the nature of works practice. The actual training in this cannot, however, begin until after the end of the fourth year, and this is the point at which I wish to make my appeal. The students who leave us, though they have all had the same training, are men each with his own special character and mental endowment. It is the function of the works they enter to find out what special aptitudes each man has, so that at the end of his period of training in their practice he can be entrusted with work which will make the very best of him. Give him, therefore, for a sufficient time an opportunity of acquainting himself with every side of that practice—not the laboratory methods only, but the practice of each of the operating departments. Give him time to find his feet and to acquire the works atmosphere, and let him have adequate opportunities of obtaining information on any details he wants as to the why and wherefore of any given operation he sees but does not completely understand. Do not stint this period, for it is difficult to over-estimate its importance and possible return to you in years to come. A discerning management will have little difficulty in judging how they can best utilize the services of such a man after this probationary period, during which he should be paid at any rate a living wage.

Some of these men may develop special aptitudes in connection with the requirements of the operating departments. They may—and this is the most vital element of training that no educational institution can ever give, but only the works itself—be found capable of working with and getting the best out of the operating staff and the labor in these departments, which can only be done by the exercise of human sympathy and insight in addition to technical knowledge. In a word, their interest will be the practical operations of the plant rather than the scientific processes which underlie them. Such men are not very common, and they are worth finding out, for they are quite capable of producing reforms in works practice.

Others—in spite of their prolonged training—may never develop sufficient independence of mind or confidence in their powers to enable them to take up a position to which much responsibility attaches, whether in the operating departments or the testing laboratory, but they will usually work well and faithfully under direction and produce results upon which reliance can be placed. Do not despise them. They fill a role which brilliant men would find irksome. They do work which has to be done, and are content to do it.

Others again—and these are usually the men of the greatest originality and imbued with the desire of improving upon existing processes used in the works by discovering new methods—find the most suitable exercise of their faculties in the laboratories where facilities for research work are to be found. These men are to be encouraged, even if results are slow in coming. Some of the leading works of so eminently practical a nation as our brothers in the United States of America have recognized, not only the importance, but the necessity of establishing laboratories where work of this kind can be carried out, and where the theoretical basis of each works operation is investigated more fundamentally than can be done even in a university or technical school, and where no practical results are looked for under a period of from five to ten years. Men who are capable of doing this work are rare indeed, but most of all are they worth discovering and employing in such labors. They are the men who, if I may apply a striking phrase recently uttered by the President of the Royal Society, will produce not merely a reform in your practice, but a revolution.

PERSONAL

Mr. Fraser Reid is now in charge of the Ankerite gold mine as well as of the Coniagas silver mine, operated by Coniagas Mines, Ltd. He will be assisted at the Ankerite by Mr. Douglas A. Mutch.

Mr. D. H. Angus has resigned his position as general manager of Tough-Oakes Gold Mines, Kirkland Lake.

Mr. F. J. Brule, assistant general manager of the British America Nickel Corporation has transferred his office from Sudbury to Deschenes, Quebec, where the company's refinery is to be erected.

Mr. G. L. Fraser has been appointed general manager of the Vancouver Island coal mines of the Granby Company.

Mr. C. H. Taylor has returned to Toronto from Panama.

Mr. M. M. Summerhayes has been appointed manager for the Blueston Copper Mining Co., Nevada.

Mr. A. A. Cole, Mining Engineer for the T. & N. O. Ry. Commission, has returned to Cobalt after a visit to Toronto.

Mr. A. R. Globe, assistant manager at the Hollinger mine, has resigned.

Mr. Charles Morris has been appointed mill superintendent at the Hill Gold mine. Mr. E. H. Williams is manager.

Mr. A. E. Flynn, mining engineer of Haileybury, Ont., is investigating ilmenite deposits in Eastern Quebec.

CHROMITE MINING IN QUEBEC.

Shipments of chromite from the Quebec chromite mines are increasing and the output this year will be considerably larger than that of 1917. The output last year was 35,726 tons valued at \$495,981. The demand for chromite continues excellent, in fact it is impossible to satisfy the requirements.

MORE QUEBEC ASBESTOS MINES IN OPERATION

In addition to steady production at the mines which were in operation last year, several which have been idle for some years are being reopened. The Berlin mine at Rumpelville, the Regent mine at Robertson and the Eastern Townships mine at East Broughton are being reopened and their mining and milling equipment is being replaced.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA

MORE LEAD, ZINC AND COPPER NEEDED FOR SHELLS.

As the Kootenay and Boundary Districts of British Columbia are centres for the production of lead, zinc and copper it is expected that mining activity in these sections will be considerably accelerated as a result of the orders received in Canada from the British Government for a large increase in shrapnel production. It is anticipated that the Trail Smelter of the Canadian Consolidated Mining and Smelting Company will be worked to capacity, and that the operators of the silver-lead-zinc properties of lower British Columbia, will be kept busy in order to do their part in bringing the output up to 220,000 shells a week, which is what the British War Office has requested.

RAMBLER-CARIBOO MINES.

The annual report of the Rambler-Cariboo Mines, Ltd., Slocan, B.C., covering receipts and disbursements from May 1, 1917, to April 30, 1918, has been issued. It shows receipts from shipments of \$78,767, derived from lead ore worth \$63,732 and zinc ore worth \$4,226. Surplus brought forward from last year was \$21,849, making total receipts of \$100,634, including \$17.25 for transfer fees. Disbursements at the mine reached \$62,343 and one dividend of a cent a share, or \$17,500 was paid, making total disbursements, less special discount, of \$42,798, and leaving cash balance of \$20,833 in New Denver, Spokane, and Colfax banks. Ore in transit is worth \$20,000, so that the total liquid resources at time report was issued were approximately \$40,000. For damage done to tramway and buildings by snowslide during the winter \$6,580 was written off as well as \$5,991 for depreciation of buildings and plant. Two of the most pertinent paragraphs of the directors' report read as follows:

"In the past most of our net profits came from the shipment of clean ore, but during the past year we unfortunately encountered but small amounts of clean shipping ore and the operation of the mill on concentrating ore has but little more than paid expenses.

"We will be prospecting during the coming year on what we think is promising ground, and hope to pick up some good, clean bodies. In that event the earning power of the company would improve rapidly."

DEVELOPING MOLLY GIBSON GOLD-SILVER MINE.

Considerable development work is being done on the Molly Gibson gold-silver property in the Nelson, B.C., Mining Division. A tunnel is being driven about 160 feet below the upper workings, to get in below the orebody and allow the rock to be stoped down and taken out by gravity, thus reducing considerably the cost of operation. Those interested believe that it is destined to prove one of the big gold producing mines of British Columbia. It is claimed that a shipment to the Trail smelter yielded \$22.76 per ton in gold and silver. The Provincial Mineralogists' Report for 1917 refers to the Molly Gibson Mine, which is situated 32 miles from the Granby smelter and 56 miles from Trail, as follows: "This mine was closed till the end of June. Work was started in July at the mine, and at the mill in August. All the development work was for enlargement of stopes. Some 367 tons of crude ore

1,759 tons of feed and produced 134 tons concentrates, which was not shipped. A new flotation process was installed and a Hardinge ball-mill is now on its road to the mill. The average number of men employed was fifty."

There will be eight parties of the Geological Survey Branch of the Mines Department, Ottawa, in the field in British Columbia this summer. Several of these are at work already and the others will be equipped as soon as possible. As there are only about 25 such parties at work throughout Canada this year the comparatively large proportion assigned to this Province is taken as an indication that the Federal authorities are recognizing to a greater extent than ever the importance of the most westerly of the Canadian Provinces from a mining standpoint. This view is emphasized by the fact that a permanent Geological Station, under Mr. Charles Camsell, of the Geological Survey Branch, has been established in British Columbia.

Ore Testing Mill for B.C.

Reference has been made in these notes to the intention of the Dominion Government to establish an ore testing mill in British Columbia. It was thought that an appropriation of \$40,000 would be made at the last session of the Federal Parliament, Ottawa, to carry out the project. This action, however, was not taken, so that the mill will not be started this year. Assurances have been received that the financial support necessary will be forthcoming in 1919. It is said that the officials of the Mines Department, Ottawa, realize the need of such a plant in this province; that they appreciate that the operators of the complex ore mines of the Slocan, Boundary and other districts would be materially aided in putting their properties on a paying basis were the means provided by which they could obtain accurate information as to the most economical method of treating their ores; and that it is believed that it is in the general interest of the mining industry throughout Canada that the step referred to be taken with the least possible loss of time.

Increased Wages at Trail.

The Canadian Consolidated Mining and Smelting Co. has granted to the employes at its Trail Smelter a war bonus which gives them an additional 15 cents a day for every working day in the month of May and for six months, starting with June 1st, 1918, an extra 25 cents per day. It is explained that this action has been taken because of a realization that there has been a further increase in the cost of living within the past several months.

Searching for Platinum in B.C.

The quest for platinum in British Columbia is to be vigorously prosecuted this summer. Mention has been made heretofore of the fact that the Dominion Government has put competent engineers in the field for the purpose of investigating reported occurrences of the mineral as well as of the fact that the intention is to examine the placers of the Tulameen District, British Columbia, and some sections of the Cariboo. Since it has been learned that the Department of Mines, Ottawa, proposes to purchase two additional drills and that the intention is to place these drills on placer ground in British Columbia with a view to the establishment of platinum values. If occupied ground is selected a covenant will be obtained from the owners that, in the event of the mineral being located, energetic work in

its recovery will be inaugurated without delay. It is not expected that the Government will demand a monetary return for the development of privately held property believed to contain platinum because of the need of this mineral for munition purposes and the consequent necessity of giving the miners every possible encouragement to produce it.

Building Flotation Plant and Railway for Copper Mountain Property.

The Canada Copper Company continues to carry on its programme of development of its large low grade copper mineral claims situated on Copper Mountain. It now is engaged in the construction of a railway, about fourteen miles long, to the property from the town of Princeton, B.C. There connection will be had with the Kettle Valley Railway. An oil flotation plant, with a daily capacity of 3,000 ton of ore, is being built near Princeton on the line of the new railroad. Cut timber for the structures required for the housing of the mill plant is being supplied by the company's own saw-mill located in the vicinity. The contract for the railroad has been secured by W. P. Tiernay & Son who have 200 men employed and are reported to be making good headway. As soon as the road is advanced far enough machinery will be shipped in for the concentrator and will be installed under the supervision of Mr. Van H. Smith, who has had experience along similar lines in Montana, Utah and other of the Western States. As a result of this activity and the prospect of an early start in the production of copper, its concentration, and the shipment of the concentrates to the company's smelter at Greenwood, B.C., the town of Princeton and the whole surrounding district is experiencing something of a boom, all available houses being rented and a general atmosphere of prosperity being apparent.

A year ago it was announced that the presence of at least 5,000,000 tons of ore in this Copper Mountain property had been proved. Since then there has been considerable increase. Starting with the exploration of the ground by diamond drill work, the company followed with a comprehensive system of tunneling, lateral operations and raises. "This makes possible," General Manager Oscar Lachmund has pointed out, "the ready removal of the ore above tunnel level by glory hole methods and the rest by various stoping methods. The ore lies in parallel bodies adjoining the dikes that traverse the country in northerly and southerly directions. The average content of the ore is 1.75 per cent. copper, although bunches in some sections contain 4 to 5 per cent. The recoverable values in gold and silver are about 20 cents to the ton."

SPINNING ASBESTOS IN QUEBEC.

The Dominion Asbestos Spinning Co. has started at East Broughton, Quebec, a plant for the manufacture of asbestos yarn, carded asbestos and sheet packings. Asbestos cloth, brake linings and packings will be manufactured when the necessary machinery can be obtained.

NICKEL REFINERY IS IN OPERATION.

On July 1 the International Nickel Company of Canada began to treat matte at the new refinery at Port Colborne. A large quantity of matte from the Copper Cliff smelter has been shipped to the refinery and supplies of all kinds are now on hand, and one furnace is in operation.

"The Strathcona Park Amendment Act" is a measure passed by the 1918 Legislature of British Columbia which is of special interest to the prospectors of the North-West. This opens to mining development a highly mineralized section of Vancouver Island, comprising 530,066 acres. It was closed some years ago in order that it might be preserved in its natural state as a National Park. It is claimed by the present Government that the location and the exploitation of its mineral cannot interfere, at any rate to any material extent, with its value as a park, and consequently permission now is given to miners to record claims within its limits and to proceed with the work of their development and the taking out of ore.

USES OF GRAPHITE.

Graphite is in various ways essential to the success of military operations. Large amounts are required for the manufacture of crucibles, for foundry facings, for dry battery fillers, and for a protective polish for explosives. Its most familiar uses, in lead pencils and stove polish, consume comparatively little of the total output.

The crystalline graphite for making crucibles should contain as high as 85 per cent. of graphite carbon and should be free from mica, pyrite and iron oxide, which are particularly harmful impurities. It should also preferably contain a large proportion of flakes 1 millimeter or more in diameter, so that its fragments may interlock and thus be more easily bound together by the clay with which it is to be mixed.

The collieries of the Nicola-Princeton District show a similar improvement, the Middlesboro Collieries increasing their output 14,963 tons, although the Princeton Collieries have dropped about 3,000 tons.

Sheet zinc, f.o.b. smelter, 15.00.

THE LUCKY JIM SCANDAL.

Northwest Mining Truth, published in Spokane, Washington, has been active in exposing stated irregularities in connection with the Lucky Jim Zinc Mines, Ltd., which had for several years been operating the Lucky Jim mine, situated in the eastern part of Slocan mining division of British Columbia. The Lucky Jim is one of the oldest of the Slocan operating mines, having in the nineties shipped lead-zinc ore to the Pilot Bay smelting works for concentration there. The late Geo. W. Hughes acquired the mine in the early part of the present century and made considerable money out of the zinc ore he mined and shipped to Kaslo for preliminary concentration at the Kootenay Ore Company's sampling mill there. In later years Mr. G. Weaver Loper, of Spokane, obtained control, and he induced many Manitoba men, chiefly residents in Winnipeg, to buy shares in the company he organized. Eventually a first mortgagee took action to obtain possession of the property, but the persistent fight put up by Loper resulted in the Supreme Court of British Columbia appointing Mr. A. G. Larson, of Spokane, well known in West Kootenay district in which he had been superintending mining operations, chiefly at Rossland, for many years. Worked under Mr. Larson's direction, the Lucky Jim paid off two mortgages and a considerable proportion of the unsecured liabilities. Meanwhile Spokane and other shareholders in the company, after having resorted to the courts and taken other means to attain their object, finally succeeded in ousting Mr. Loper from control and possession of the company's books, etc. Searching investigations eventually proved that there had been a serious over-issue of shares.

A letter, dated March 30, 1918, sent by Mr. Walter J. Nicholls, of Spokane, to the Spokane Stock Exchange, as published by Mining Truth, reads thus:

"The audit made of the books of the Lucky Jim Zinc Mines, Ltd., shows an over-issue of 3,094,299 shares and this stock is all transferable, the capital stock having been increased to 6,000,000 shares. I suggest that should you list this issue, that you provide that only shares represented by the new form of certificate registered by A. W. Allen, assistant-secretary, be admitted. Some of the old certificates may be issued for a greater amount than shown on the stubs, consequently you should specify that only the new forms are listed."

In this connection, Mining Truth makes the following editorial comment: "Directors of the Spokane Stock

Exchange have been asked to restore Lucky Jim Zinc Mines, Ltd., to the official list, and, quite properly, the request has been denied. It will be repeated, however, again and again, in the hope that those most vitally interested may be given an opportunity of working off a discredited issue upon the general public. There should be no temporizing and no palliation of the disgraceful episode. In all the mining history of the Northwest no other such astounding scandal has occurred—under the very noses of sworn officers of the law and with a brazen disregard for decency that puts the guilty outside the pale of consideration. Originally capitalized for \$2,500,000, in \$1 shares, that capital has been 'lifted' to \$5,594,000 by a barefaced system of illegal transfers without counterpart anywhere. The fact that genuine stockholders, harassed and bewildered, have failed to protest expansion of capital stock to cover the defalcation does not alter the situation in any way. The whole matter is so disgustingly dishonest that the Spokane Stock Exchange cannot afford to burden itself with the stigma that must attach to even tacit acquiescence in such flagrant violation of law. Any disposition to restore the corporation's stock to good standing could only be characterized as connivance in a most disreputable affair. Compounding of felony is inimical to the best interests of an institution whose prime duty should be protection of the investing public. Until the blame has been placed and the sunlight of truth let in, there is no place for Lucky Jim upon the official list of any organization of self-respecting men."

The editor of Mining Truth has communicated with the Prosecuting Attorney for Spokane and also with the Presiding Judge of the Superior Court of Spokane County. The former, it is stated, declined to act unless some one would first "swear to an information charging anyone connected with Lucky Jim affairs with a crime," but the Judge of the Superior Court will probably bring the matter before a full bench of the Court, with a view to calling a Grand Jury or taking some other steps in the matter.

The editor of Mining Truth also communicated with the British Columbia Registrar of Joint Stock Companies, and has published the following reply from that official:

"The over-issue of this stock certainly is a bad case. My information is that the company, under the present management, is doing all in its power to rectify the situation and prevent the persons who bought the unauthorized shares from suffering loss.

HOISTS, BUCKETS, CARS

MINE HOISTS, made in 7 sizes, from 10 to 50 horse power, and with any diameter of drum up to 48 inches at bottom of flanges.

MINE BUCKETS, made any size, shape, or style, to suit the customer.

MINE CARS, made in a large variety of sizes and styles to suit the particular work for which they are intended

MINE CAGES, with safety devices, made to order, to fit the customer's shaft.

MINE SKIPS, self-dumping and self-righting, made in a variety of sizes and styles.

Our large catalog describing all of above is yours for the asking.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

- Fuel Testing Laboratory.**—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.
- Ore-Dressing Laboratory.**—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.
- Chemical Laboratory.**—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.
- Ceramic Laboratory.**—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.
- Structural Materials Laboratory.**—Experimental work on sands, cements and limes is also undertaken.
- Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

- Maps published within recent years may be had, printed on linen, at the nominal cost of ten cents each.
- The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.
- Communications should be addressed to The Director, Geological Survey, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

THE recent decision in the Butte & Superior Suit with Minerals Separation has an important bearing upon the use of the Pneumatic, or Callow method of flotation.

The Appellate Court's decision at Philadelphia, in the Miami case, had already made clear the distinction between (1) froth produced by violent mechanical agitation of the Minerals Separation process, and (2) simple levitation by air bubbles, as practised in the Callow or pneumatic cell, without such agitation.

Now the Appellate Court at San Francisco has interpreted the United States Supreme Court's opinion in the Hyde case, whereby the Minerals Separation Patent was restricted to the use of a minimum, or 'critical' proportion of oil, in combination with violent mechanical agitation.

This latest decision of the Appellate Court in the Butte & Superior case, restricts the Minerals Separation basic patent to the use of a quantity of oil *not in excess of ten pounds (0.5%) per ton of ore, in combination with violent agitation*: it is a logical sequel to the Supreme Court's opinion and confirms the status of the Callow or Pneumatic method of flotation as distinct from the agitation-froth process.

Both the use (1) of oil in excess of ten pounds (0.5%) in combination with violent agitation, and (2) the use of the Callow system of aeration with any quantity of oil, appear therefore to be immune from any charge of infringement.

(Signed) J. M. CALLOW

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

AUCTION SALE of Valuable Graphite Property

Near Buckingham, Province of Quebec, Canada.

The undersigned will offer for sale by public auction at W. A. Cole's Auction Rooms, No. 63 Sparks Street, in the City of Ottawa, Canada, at 2.30 o'clock in the afternoon of the tenth day of September, 1918, the property known as the "Walker Graphite Mine," in the Township of Buckingham, comprising about 1250 acres of land, held in fee simple. The property is situated about six miles from the town of Buckingham, on the Canadian Pacific Railway, between Montreal and Ottawa, and less than ten miles from the landing on the Ottawa River. The quantity of ore is practically inexhaustible, and the mining facilities are exceptional.

The buildings consist of refinery, engine and boiler house, manager's dwelling, foreman's dwelling, and other buildings. The lands are well timbered and contain ample supplies for mine purposes and fuel. The right to cut basswood until the 1st day of March, 1919, has been sold.

A large quantity of machinery, plant and tools on the property will also be sold as a separate lot. Both sales will be subject to reserved bids.

Applications to inspect the property may be made to Mr. Sam. Devine, Buckingham, Quebec, Canada, and further particulars may be obtained from

M. J. GORMAN, Vendor's Solicitor,
Union Bank Building,
Ottawa, Canada.

SERVICE

The Technical Division of Canadian Explosives, Limited, is not merely organized to increase the sale of explosives. It is their function to assist and advise regarding the blasting operations of any concern having "explosive" difficulties, and if need be, stay on the job and direct the work until the trouble is removed.

The Technical Division is equipped to take care of the most difficult blasting problems. Every man is an expert, experienced in actual work.

Put your blasting difficulties up to us.

Chromnic The Steel that Wears

FOR crushing plates and all parts of crushing machinery and stamp mills. Also cams, tappets, shoes and dies. This steel outwears and outlasts any other make by 25%. It has stood the most exhaustive tests and excels the much vaunted Krupp steel.

We make castings of "Chromnic" steel for all mining machinery, and guarantee quick service.

The next time you order parts---try Chromnic steel.

CORE DRILLING ACCURACY

The secret of successful drill prospecting is **ACCURACY**. Inaccurate records, by misleading, may cause great waste of money and time in useless development.

SULLIVAN DIAMOND DRILLS

and **SULLIVAN DRILLING SERVICE**

have a high standing for accuracy and reliability, attained by 43 years of drill manufacture, and by 35 years of contract core drilling work in all parts of North America and in many foreign countries.

Sullivan Double Tube Core Barrels

illustrated by this sketch, represent the highest accuracy in prospecting for coal or in other soft or broken formations. The core, two inches in diameter, is protected from vibration by the stationary inner chamber. The wash water passes **outside** of this tube, so that it has no chance to eat the core away. The outer barrel revolves, with the diamond bit, to perform the cutting. When full of core, the barrel is lifted out, keeping the section of coal or other friable rock or mineral intact.

Write for prices on Accurate Core Drilling.
Sullivan Service is cheapest in the long run.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

The "Little David" Pedestal Grinder

WHAT IT DOES

Squares off drill steel shanks,
dresses bits.

Reamer extension reams out
hole in hollow steel shanks.

Uses air power only when
working.

WHAT IT SAVES YOU

Saves time lost in drilling due
to badly squared shanks.

Saves time lost in drilling due
to clogged water passage.

Saves trouble and expense from
broken shanks and pistons.

Strictly a no-trouble machine

INCREASED PRODUCTION

A Necessity--and a Patriotic Duty

With the present shortage of labor in the Canadian market and the vital necessity of increasing our mineral production to its utmost capacity, labor saving and high efficiency machinery and equipment must play a prominent part.

With the use of a "New Cleveland" Stoper you can increase your output and yet cut the cost of your drill upkeep. It multiplies the efficiency a thousandfold. Its drop forged parts of simple design, which are practically unbreakable, give you economy in time and repairs; also the air consumption is low because of the "Pocket-in-head."

Give us an opportunity of proving these facts to you. There will be no obligation on your part.

AUCTION SALE of Valuable Graphite Property

Near Buckingham, Province of Quebec, Canada.

The undersigned will offer for sale by public auction at W. A. Cole's Auction Rooms, No. 63 Sparks Street, in the City of Ottawa, Canada, at 2.30 o'clock in the afternoon of the tenth day of September, 1918, the property known as the "Walker Graphite Mine," in the Township of Buckingham, comprising about 1250 acres of land, held in fee simple. The property is situated about six miles from the town of Buckingham, on the Canadian Pacific Railway, between Montreal and Ottawa, and less than ten miles from the landing on the Ottawa River. The quantity of ore is practically inexhaustible, and the mining facilities are exceptional.

The buildings consist of refinery, engine and boiler house, manager's dwelling, foreman's dwelling, and other buildings. The lands are well timbered and contain ample supplies for mine purposes and fuel. The right to cut basswood until the 1st day of March, 1919, has been sold.

A large quantity of machinery, plant and tools on the property will also be sold as a separate lot. Both sales will be subject to reserved bids.

Applications to inspect the property may be made to Mr. Sam. Devine, Buckingham, Quebec, Canada, and further particulars may be obtained from

M. J. GORMAN, Vendor's Solicitor,
Union Bank Building,
Ottawa, Canada.

W. A. COLE, Auctioneer

CRUSHING ROLLS FOR COAL

Breaker Rolls with inserted teeth

The crushing of coal and other soft material is most satisfactorily done by means of rolls with pointed teeth or with corrugations.

We are prepared to furnish coal crushing rolls with inserted steel teeth or those with teeth cast on segments which are bolted to the roll bodies. Of the latter type, those with teeth cast on manganese steel segments are the more satisfactory.

Corrugated Rolls and those of the pointed tooth type are especially adapted to the crushing of rock salt, phosphate rock and similar materials. We are prepared to furnish machinery to meet the various requirements for this class of work.

CANADIAN ALLIS-CHALMERS

LIMITED

Offices : Toronto, Montreal, Quebec, Halifax, Sydney, Ottawa, Cobalt, South Porcupine, London, Winnipeg, Calgary, Edmonton, Nelson, Vancouver.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

Up to 170 Tons of Coarse Product per Day

**No. 10 WILFLEY
in Action**

Note Heavy Bed of Pulp
Carried

This enormous capacity recommends the use of the No. 10 Wilfley wherever the conditions will permit.

While primarily a roughing table, the high efficiency of its separation enables this table to deliver a finished product in certain types of installation,

The savings effected by its use are obvious. Because of its capacity, the No. 10 Wilfley for a given tonnage, will have a smaller initial cost, smaller operating cost, will occupy less floor space and use less power.

This is but one of the many Wilfley Tables—all of them are noted for their satisfactory service.

Tell us your requirements.
Let us give you complete
information concerning the
Wilfley Table exactly suited
for your needs.

**MILES FROM A COW
YET FRESH EVERY DAY**

KLIM
IN POWDER FORM

Time and distance do not affect the genuine flavor and food value of KLIM. To the mining Camp located far from green pastures and grazing cows and shut out from enjoying a supply of fresh milk every day, Klim brings with the truest flavor and in a convenient form—dry powder—all the advantages of pure, pasteurized separated milk.

KLIM is easy to use. Mix it dry with other dry materials in baking. Dissolve it in water for use as liquid.

A 10-lb. tin makes 40 qts. Klim will not turn sour nor spoil in any temperature. It can be used as needed from the tin.

THE CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO, August 1st, 1918.

No. 15

The Canadian Mining Journal

With which is incorporated the
"CANADIAN MINING REVIEW"

Devoted to Mining, Metallurgy and Allied Industries in Canada.

Published 1st and 15th of each month by the
MINES PUBLISHING CO., LIMITED

Head Office 263-5 Adelaide Street, West, Toronto
Branch Office 600 Read Bldg., Montreal

Editor: **REGINALD E. HORE, B.A. (Toronto).**

SUBSCRIPTIONS.

Payable in advance, \$2.00 a year of 24 numbers, including postage in Canada. In all other countries, including postage, \$3.00 a year.

Single copies of current issue, 15 cents. Single copies of other than current issue, 25 cents.

The Mines Publishing Co. aims to serve the mining industry of Canada by publication of reliable news and technical articles. This company publishes the Canadian Mining Journal twice a month and the Canadian Mining Manual once a year.

ADVERTISING COPY.

Advertising copy should reach the Toronto Office by the 8th for issues of the 15th of each month, and by the 23rd for the issues of the first of the following month. If proof is required, the copy should be sent so that the accepted proof will reach the Toronto Office by the above dates.

ADVERTISING.

The Canadian Mining Journal covers the Canadian mining field. Ask for advertising rates.

CIRCULATION.

"Entered as second-class matter, April 23rd, 1908, at the post office at Buffalo, N.Y., under the Act of Congress of March 3rd, 1879."

It may confidently be expected that the larger market for Alberta coal which has resulted from the scarcity of American coal will be held after the war. At present the freight rates prevent Alberta coal from being sold cheaply in Manitoba; but it is reasonable to expect that some adjustment will be made when conditions permit. In the meantime, Canadians will become acquainted with the fact that Alberta coal has not been utilized to the extent that it should.

During the month of May a technical clerk was temporarily required in the Topographical Surveys Branch of the Department of the Interior at a salary at the rate of \$1,300 per annum, and it is stated that "applications will be considered from graduates in Applied Science, honor mathematics, or physics, of some recognized university." Qualified draughtsmen, competent to perform engineering and architectural work are offered \$125 per month. By way of contrast, a "motion-picture camera man" required by the Department of Trade and Commerce is to be given an initial salary of \$2,400 per annum, and a law clerk to an initial salary of \$2,100.

BREAKING THE GERMAN METAL TRUST.

The announcement that the Alien Enemy Property Custodian of the United States has taken over the German metal firms of L. Vogelstein & Co., and Beer, Sondheimer & Co., Inc., may be taken as an indication that the German metal trust is going to fare badly in America in the future. The Germans had, when war broke out, a very strong hold on the metal markets of the world and they displayed considerable ability in keeping control during the war. The impression here has been that the British and Canadian Governments have not handled the metal business in a way to excite much admiration. Our Australian friends showed some time ago that they intended to free themselves of German control of metals and now that the United States authorities have taken action, we may reasonably expect that the governments of all the countries allied against Germany will seriously consider plans for completely breaking the German control of metals. By united action of the allies, the Germans should for all time be prevented from obtaining a controlling interest in the metal business in any country but their own.

Of special interest to Canadians is the announcement concerning Beer, Sondheimer & Co., Inc., successors to the American branch of a German firm which at the opening of the war was agent for the Minerals Separation Company. The behavior of this firm has been such that it would be difficult to consider it other than a dangerous enemy. Naturally the Minerals Separation corporations which were associated with Beer, Sondheimer & Co., have been also under a cloud of suspicion. Up to date, however, there has been no disclosure of evidence which would indicate that the Minerals Separation American Corporation is controlled by Germans and so long as the Alien Enemy Property Custodian of the United States is satisfied we can only assume that the Minerals Separation companies are in safe hands. The question of the status of the American corporation is one that has no doubt received the attention of the American authorities. Some time ago we asked that an explanation be given of the connection between Beer, Sondheimer & Co., and the Minerals Separation companies. The replies have been more or less satisfactory insofar as they showed that the Governments interested were cognizant of the facts and were satisfied. These replies have, however, not removed the suspicion that some Government officers are too easily satisfied and it is a pleasure to note that the American government, which has at its command the services of many leaders of the metal industry, is now exterminating vermin at a rapid rate. There has been a great deal of damage done by these German metal firms in all the countries fighting against Germany. The peculiar behavior of British and Canadian

governments in this matter must have pleased the Germans. We have, however, always had confidence that the leaders in the American metal industry would make short work of the enemy interests when the time came and we now look for more revelations and eventually international action to prevent the Germans from ever again gaining control of the trade in metals.

THE GOLD PROBLEM.

The high cost of production has now made the mining of gold at a profit almost impossible. What is to be done? Is gold needed? Why not close down the gold mines and put the employees at other work? Is it of any advantage to Canada to mine gold when the cost is so high and the selling price remains fixed? Is gold production necessary for the purposes of trade during the war? If gold is needed how can it be obtained? If the government recognizes that gold is necessary, what steps can be taken to encourage production?

The problem of maintaining credit without gold is a Canadian problem and also a world problem. It must be considered from many points of view. Some think that we could get along without more gold for a few years, so long as the attention of everyone is directed solely to the prosecution of war against Germany. Others believe it to be vitally important that production of gold should not be curtailed.

If everyone is willing to assume that there is sufficient gold available there probably will be. Even if some should be unwilling to believe that the gold exists, they will probably not make great demand for their gold during the war. The shipment of gold from place to place to balance credits would be scarcely necessary if such faith existed. It may even be viewed as a confession of lack of faith, unless gold is really essential for the prosecution of the war.

During the war there have been extraordinary movements of gold among the allied countries. The banks are evidently committed to this habit. If it should be found possible to avoid such shipments between allied countries during the balance of the war we may expect a return to old habits as soon as the war is over.

After the war there is to be a readjustment period, the character of which nobody can foretell. If it proves similar to the period following the outbreak of war there will be so much uncertainty in business that confidence in others, in the value of securities of many kinds, and in the future of business enterprises will be disturbed. The value of commodities and labor will fall, but the price of gold will remain stationary. At that time it will obviously be greatly to the advantage of Canada to have large reserves of gold. It is well to remember that in order to build up a supply of gold we must do a lot of work at the mines. Gold deposits do not pay on demand. We cannot leave the mines idle now and expect them to produce large quantities of gold when it is needed most. Moreover, it costs

a lot of money and labor to keep a mine in condition for operation even when not producing an ounce of metal. Gold should be recovered as soon as possible after it is discovered. Gold deposits are of little value to the country so long as they stand unworked. Where labor and capital have brought a mine to the producing stage it is in the general interest that production should continue steadily at capacity until the deposit is worked out.

If it is admitted that a large gold reserve in Canada is worth striving for, it should not be impossible to extend assistance to gold mining companies by paying a bonus on gold produced during the war. That gold is necessary during the war has been pointed out by competent authorities; but the necessity seems to be that the allies, and not Canada particularly, need it. The encouragement of gold production during the war for war purposes should therefore come from international action, Canada falling in line with the larger producing countries. Our governments have to consider also what should be done to utilize Canadian resources to maintain Canada's credit after the war. This is also a matter which cannot be postponed until after the war, for if gold is wanted then much of it must be mined now.

While a bonus system would be necessary in order to permit the profitable working of some of our gold mines, it is probable that a fairly large production could be profitably made without a bonus if the labor supply were improved. At present the efficiency of the workers is very low and to this cause the managers of the chief producers attribute largely their inability to operate satisfactorily. Given the choice of a bonus or a force of efficient miners, few managers would hesitate to take the latter.

UTILIZING WESTERN COAL.

One result of the shortage of coal in many parts of Canada has been the direction of attention to the coal resources of the Western Provinces. Good bituminous coal in very large quantities occurs in Alberta and British Columbia; but it has nevertheless been customary to import both bituminous and anthracite coal to supply the West. It has been difficult to make consumers realize in the heat of summer that there will be a shortage of American coal next winter. Last summer the output in Alberta was necessarily small. About two months ago the Provincial Government started an advertising campaign, advising people to stock their coal early. Good results are now being obtained from this campaign and sufficient orders have been received to warrant running the mines at capacity. To-day Alberta coal mines are shipping to Manitoba 2,000 tons per day as compared with 200 tons per day a year ago. In the Drumheller district the production in June was 93,000 tons as compared with 31,397 tons in June last year.

Nodulizing Flotation Concentrates

In the latter part of 1917 there were carried out near Princeton, in Similkameen district of British Columbia, by Mr. R. M. Draper, of Southboro, Massachusetts, U.S.A., formerly with the U.S. Metals Refining Co. at Chrome, New Jersey, some experiments for the Canada Copper Corporation in nodulizing copper concentrate from a preliminary small concentration plant the company had for some time been using in testing methods for the concentration of copper ore from its mines on Copper Mountain, at which much exploratory and development work had been in progress for several years.

This company now owns and operates mining properties in Boundary and Similkameen districts, and copper smelting works at Greenwood in the former district, previously owned and worked by the British Columbia Copper Co. Much of the commercial ore in the company's largest mine, the Mother Lode in the neighborhood of Greenwood, having been exhausted, mining operations have for some time past been largely concentrated at the Copper Mountain mines, at which about 12,000,000 tons of copper ore is estimated to have been practically proved to occur, with a reasonable prospect of considerably more being developed, when much more work shall have been done on the large group of mineral claims in the locality owned by the company.

In passing, it may be mentioned that the company's smelting plant at Greenwood is modern in design and equipment and is likely to be used in smelting ore and concentrate from its Copper Mountain mines. In a published paper, descriptive of this plant, Mr. Frederic K. Brunton, formerly superintendent of the works, stated that it "is of special interest to metallurgists for several reasons. It was successfully smelting in blast-furnaces the lowest-grade copper ore of all plants in America. In order to do so, it had to run at very high efficiency, which necessarily required a large tonnage per square foot of hearth area, together with the minimum amount of labor and other costs. The furnaces smelted daily 2,250 tons of ore (6.62 tons per sq. ft. of hearth area), carrying 0.85 per cent. of copper, at a smelting cost of \$1.18 a ton. The entire plant required 130 men to operate it and keep up repairs, showing a labor efficiency of about 17.5 tons per man per day." Of the three blast-furnaces, two are 51 by 360 in. and one 51 by 240 in. at the tuyeres, making the total smelting capacity 2,400 tons a day.

The process of nodulizing concentrates is carried out by passing the material through a revolving kiln, the while subjecting it to sufficient heat to cause the fine particles to roll up and adhere together in a ball; at the same time care must be taken not to make the temperature in the kiln hot enough to melt the concentrates.

While nodulizing is no longer an experiment with oil as fuel, the process having been introduced at Chrome five or six years ago, and since used on a commercial scale, it is believed to be quite an experiment on flotation concentrate, using coal-dust as fuel, certainly so far as known in the North-west.

The position was that, while the Canada Copper Corporation had satisfied itself as to the adaptability of the flotation process for the concentration of ores from its Copper Mountain mines, which ores have been estimated to have an average assay value of 1.74 per

cent. copper, the problem of how best to make the fine flotation concentrate suitable for charging into the blast-furnace had not been solved. Hence the experimental work on nodulizing conducted near Princeton last year by Mr. Draper for the company.

It happens that there is at East Princeton, distant about twelve miles from the Copper Mountain mines, a cement-manufacturing plant that had for some time been inoperative, so, notwithstanding that the cement rotary kiln available there is of present standard size and larger than had been found suitable for nodulizing at Chrome, it was used by Mr. Draper in carrying out his experiments there. The dimensions of this kiln are: length 125 ft., and inside measurement 7 ft. It is about 25 ft. longer than need be for the nodulizing work for which it has been used. Despite this disadvantage, however, very successful results were achieved by Mr. Draper; the nodulized product being material of a character suitable for reduction in the blast-furnace, with about 82 per cent. of its sulphur content retained, which is an important consideration in a country where the percentage of sulphur in the ores available for smelting is generally already too low.

It was estimated that a 100-ft. rotary kiln would nodulize from 100 to 125 tons of flotation concentrate in 24 hours. At East Princeton both mine run and slack coal is obtainable from a nearby coal-mine, while included in the equipment of the local cement works is all the plant requisite for drying and pulverizing the coal, which, after having been pulverized, is fed into a hopper, from which it runs into a blast-pipe and is blown thence into the kiln. Electricity is generated at the cement works for other uses, so that the comparatively small amount of power required for operating the kiln is obtainable at small cost, while the charge for labor in attending to the kiln and, as well, for repairs to it, is quite small.

It may be added that, while quite successful results were obtained in nodulizing flotation concentrate from both the Copper Mountain plant and another mill at Highland Valley, in Ashcroft mining division of British Columbia, experiments made with table concentrate, also at East Princeton, were not so successful.

Results of Previous Work.

For the information of those not already familiar with the results previously achieved in nodulizing both blast-furnace flue dust and fine sulphide concentrates, the following excerpts have been made from a paper by Mr. Lawrence Addicks, of Douglas, Arizona, presented at the Salt Lake, Utah, meeting of the American Institute of Mining Engineers in August, 1914 (see Trans. A.I.M.E., Vol. XLIX., 1914, pp. 500-6), in which an account is given of what had then been done to solve a problem arising from the "constantly increasing piles of unsmelted blast-furnace flue dust," that at the smeltery connected with the Chrome, New Jersey, refinery of the U.S. Metals Refining Co., had proved embarrassing; and from the discussion of that paper.

Mr. Addicks wrote, in part: "The charge was fine and 10 to 15 per cent. of it was blown into the flue. Sulphur was at that time too scarce to make the sintering of the finer part of the charge attractive, and raw-ore smelting in a reverberatory with a partly oxidized charge was not to be thought of.

"A great many schemes were considered, including leaching, blowing into the converters, and briquetting,

the problem finally narrowing down to blast roasting and nodulizing. It was found by experiment that blast roasting would not yield a satisfactory sinter without the addition of coke dust or sulphide fines to augment the fuel value of the flue dust, and on this account, together with the low cost of a kiln, the latter was decided upon.

"Two tons of flue dust was tried out in the experimental kiln in the laboratory at Yorktown, Va., of J. H. Payne, who acted as consulting engineer in this connection. This kiln was approximately 2 ft. in diameter and 20 ft. long and was fired with fuel oil. A run of several hours yielded excellent nodules. The kiln showed no tendency to build in and form 'nose rings,' and gave a fuel consumption of 50 gal. of oil per ton of flue dust. There was no indication of any stack loss. The roasting was strongly oxidizing. A study of what full-size kilns were doing on cement clinker and on nodulizing pyrites cinder indicated that a 60 by 6 ft. kiln would certainly not consume more than one-half of the oil per ton of flue dust shown on the test and as fuel oil at that time was selling around 2½ cents a gallon, it was decided to let it go at that.

"A 60 by 6 ft. kiln was decided on, as that is standard in cement practice, although fast being replaced by much larger ones with their greater fuel economy, and as it fitted in the building space available. A 6-in. brick lining brought the net diameter down to 5 ft. The inclination toward the discharge end was fixed at ⅝ in. to the foot, and the revolutions per minute at 1½.

"The results, while satisfactory, were quite different from those anticipated. In the first place, the fuel consumption was far lower than had been expected. A granular sand can be made with perhaps 8 gal. per ton, a first-class smelting product with 12, and great chunks with 16. It appears, therefore, that such a test kiln as that used takes about four times the fuel that will be required on a 60-ft. installation, although this ratio might be changed for different material with varying internal fuel values.

"In the matter of formation of nose rings, the test kiln was deceptive. There was a decided tendency to such formations and it took some time for the operators to acquire the necessary skill to control this. Steady conditions of flame are very necessary. If the kiln is overheated, semi-molten material forms on the walls and a subsequent over-chilling will plaster the sand on very rapidly. A number of devices were tried to meet this difficulty, but finally it was found that reasonable skill and care on the part of the attendant and an occasional shut-down of a few hours to remove any obstinate obstruction were the best remedies. . . . When perfectly clean 75 tons of flue dust can readily be nodulized in 24 hours, while a choked-up barrel will deliver less than one-half of this quantity. There is no difficulty in regular work in delivering 50 tons a day, including all delays, and a few hours' work for two or three men once in two weeks will handle the accretions."

Nodulizing Concentrates at Braden.

In discussing Mr. Addick's paper, Mr. James H. Payne, Baltimore, Indiana, first outlined further experimental work he had done on flue dust and then continued:

"In the early part of 1914, I succeeded in interesting the Braden Copper Co. in nodulizing, with the result that an extensive series of tests were made in Yorkton upon oil-floated concentrates covering quite a wide

range in analysis. These tests led to trials in the Chrome rotary, on the part of the U.S. Metals Refining Co., of Minerals Separation concentrates which they had in stock, and later to test runs to check up the Yorkton runs on Braden concentrates. The large-scale tests checked up with the Yorkton tests in every way (except fuel consumption, which was, however, correctly predicted), and led to the Braden Co.'s decision to adopt the process at Braden.

"The fuel consumption upon oil-floated concentrates is not more than 6 gal. per ton, and in many cases is less. The action in the furnace is independent of the sulphur content, and there is actually less tendency to form nose rings in the Chrome rotary than upon flue dust. It is believed that the improvements entering into the design of the Braden kilns will cut down the nose-ring trouble to where it will no longer be a drawback to the process.

"The flue dust produced by the kiln itself is practically nil, although some of the material treated has been as fine as 82 per cent. through 100 mesh. This is unbelievable to metallurgists familiar with the old Bruckner roaster, but the conditions are entirely different. The material is fed wet and what dust there is precipitates in the atmosphere of steam at the exit end. The material, furthermore, is constantly moving downward to the hot end and is in a dry, dusty state but a short time, soon changing to a densified condition which is no longer dust.

"The amount of sulphur in the nodules is under perfect control. It can be as high as 15 per cent. or as low as 5 per cent., as may be desired. The upper limit for good working appears to be about 15 per cent., as the nodules are very sticky, with higher sulphur content. A product running 13 to 15 per cent. sulphur has been readily obtained on all oil-floated concentrates so far tried, where the object was to retain all sulphur possible. This makes pyritic blast-furnace smelting of sulphide concentrates possible.

"The size and character of the product has varied with the different concentrates tested so far, and also with the sulphur content sought for. When high sulphur is desired in the product, the nodules run smaller than the flue-dust nodules, as produced at Chrome. They are, however, entirely free from material that would blow out of a blast furnace. A number of samples tested show from 42 to 45 per cent. of voids.

"Nodulizing of sulphide concentrates, particularly oil-floated concentrates, opens up a new field because it makes possible pyritic smelting of such material. Further, the operation appears to be such a cheap one that it may compete with roasting in multiple-hearth furnaces in reverberatory practice. If so, it would be far preferable to roasting in the case of the exceedingly fine-oil-floated concentrates, because of the large amount of dust that the roasters must necessarily produce on this material."

Success at Chrome on El Cobre Concentrates.

Mr. R. M. Draper also took part in the discussion, as follows:—

"The kiln will treat El Cobre flotation concentrates very successfully. There does not seem to be much of a tendency to form ring accretions, and those that do form are nearer the discharge end of the kiln, where they may be removed much more readily. The temperature of the kiln is much lower for concentrates than for flue-dust, and the oil consumption much less. Our consumption of oil was about 6 to 7 gal. per ton of concentrate.

"The nodules were very satisfactory from a blast-furnace point of view when charged into the furnace cold. We did have considerable trouble with crusts on the furnace, if we put in too much of the hot nodules, due probably to the fact that they were near the smelting point when charged into the furnace and naturally smelted much higher up in the furnace. I think we would have had this difficulty with any hot material that was charged. In fact, we found the same tendency to crust when we tried the experiment of charging hot converter slag into the furnace several years ago.

"The concentrate feed averaged about 30 per cent. sulphur, and several samples of nodules taken at various times showed an average of 14 per cent. sulphur. One sample of nodules chilled immediately in water showed a sulphur assay of 20 per cent. There is no difficulty in averaging 60 tons of the concentrates per day, and I believe that, with a proper feeding device, the tonnage could be increased to 75 tons a day. There is no question that the greater the tonnage the less the consumption of oil per ton.

"Screen Test on Nodules from El Cobre Concentrates.

	Per cent.
"Between $\frac{1}{2}$ and $\frac{1}{4}$ mesh	25.95
" $\frac{1}{4}$ " 8 "	44.75
" 8 " 16 "	24.52
" 16 " 20 "	1.64

100.00

It will be noted that, although all the product is under $\frac{1}{2}$ in., the proportion of real fines is very small.

British Columbia's Coal Production in Half Year

The Vancouver Island Collieries produced 137,895 tons of 2,240 lbs. for the month of June, a little over 5,000 tons less than the quantity produced in the month of May.

The tonnage produced by the various companies was as follows:—

	Tons.
Canadian Western Fuel Co., Nanaimo Colliery	61,685
Canadian Collieries (D), Ltd., Comox Colliery	47,926
Canadian Collieries (D), Ltd., Extension Colliery	18,367
Pacific Coast Coal Mines, Ltd., South Wellington	8,417
Nanoose Collieries, Ltd., Nanoose Colliery	1,500

137,895

For the first six months of the year the Vancouver Island Collieries produced 857,131 tons, a decrease of 24,881 tons, as compared with the same period last year. The producing mines are three less than was the case in 1917, namely, the Jingle Pot Mine, South Wellington Mine, Pacific Coast Coal Mines, Ltd., and No. 4 Mine, Canadian Collieries (D), Ltd., Extension Colliery. The Jingle Pot Mine alone produced 48,885 tons during the first six months of last year, so that, in spite of the loss in tonnage from this mine and the others since closed down, the tonnage has been well maintained.

The tonnage produced by the various companies for the first six months follows:—

	Tons.
Canadian Western Fuel Co., Nanaimo Colliery	389,984
Canadian Collieries (D), Ltd., Comox Colliery	280,151
Canadian Collieries (D), Ltd., Extension Colliery	118,148
Pacific Coal Mines, Ltd., South Wellington ...	51,181
Nanoose Collieries, Ltd., Nanoose Colliery	17,667

857,131

The Canadian Western Fuel Co. at its Nanaimo Colliery has made a gain of 63,515 tons for the first six months of the year.

The Canadian Collieries (D), Ltd., at its Comox Colliery, has made a gain of 21,233 tons thus far, but has lost 32,014 tons at its Extension Colliery. This is accounted for by the closing down of No. 4 Mine, as previously mentioned.

The Pacific Coast Coal Mines has a loss in output of 36,816 tons for the first half of the year. This is explained by the abandonment of the South Wellington Mine.

The Nanoose Collieries has made a gain of 9,086 tons, while the Jinglepot Mine of the Vancouver Nanaimo Coal Company, as stated, has produced no coal this year, while for the first half of 1917 its output was 48,885 tons.

The No. 5 Mine of the Canadian Collieries is now producing about 100 tons daily from development work and should considerably augment the Island tonnage before the end of the year.

The new mine at Cassidy's Siding, E. & N. Ry., which is being opened by the Granby Consolidated Mining & Smelting Co., is now producing coal from the development work. Some 1,000 tons has been dumped at the surface of the mine, but no shipments have been made as yet. The Island tonnage should be somewhat augmented by the production of this colliery before the end of the year.

A pair of shafts are now being sunk for the purpose of opening up a new mine on the Company's Farm near Nanaimo by the Canadian Western Fuel Co., and coal will probably be reached by October of this year; and shipments made before the end of the year.

The coal produced by the mines of the Nicola-Princeton district for the first six months of the present year was 19,972 tons in excess of that produced in the same time in 1917.

The tonnage to the credit of the several companies for the first six months of 1918 follows:—

	Tons.
Middlesboro Collieries	54,698
The Fleming Coal Co.	12,637
Princeton Collieries, Ltd.	22,148

89,483

The Middlesboro Collieries has made a gain of 19,152 tons over last year, and the Fleming Coal Co. (formerly the Inland Coal & Coke Co.) has exceeded last year's showing for the same period by 5,198 tons. The Princeton Collieries has made a gain of 355 tons.

The Merritt Collieries has not been operating this year, while last year, for the first six months, its output was 4,782. Despite this handicap, the district shows an increase of 19,152 tons.

While the returns of the Crow's Nest Pass Field are not available, it is known that the entire output of British Columbia, for the first six months of 1918, is considerably in excess of the showing made in 1917.

Mining Convention at Revelstoke, B. C.

The annual Northwest International Mining Convention of 1918, which was attended by delegates representative of the mining men of Washington, Idaho, and Montana as well as the Provinces of Alberta and British Columbia, was held at Revelstoke, B.C., on the 8th, 9th, 10th and 11th of July. It was one of the most outstanding assemblages of its kind in point of attendance, the high standard of addresses and of the general discussion, the enthusiasm with which the idea of co-operation, regardless of the National boundary, was endorsed, the very evident desire of all to assist in paving the way to further progress in the development of the mining resources of the North country, and, last but not the least notable, the splendid entertainment furnished the visitors by the citizens of Revelstoke.

One of the features of the opening session was the occupancy of the chair by Mrs. Ralph Smith, the first woman member of the Legislature of British Columbia, and the first of her sex to preside over the deliberations of such an organization. In thanking the delegates Mrs. Smith said that she appreciated the honor because it was a recognition of the right of womankind to a more prominent and influential part in shaping the policies of governing and semi-governing bodies of the country. She trusted that the Convention would follow up such resolutions as might be passed by action to the end that the mineral resources of the two nations represented might be more fully developed.

Mr. Alex McRae was chairman of the Executive Committee in charge; Mr. W. J. Coulthard, vice-chairman; Mr. F. B. Hill, secretary; Mr. L. A. Howson, assistant secretary; Mr. K. G. McRae, treasurer; and Messrs. W. A. Anstie, H. McKinnon, B. R. Atkins, A. Johnson, W. R. Grubbe, and M. H. Lister, and Dr. W. H. Sutherland, the latter being the member of the legislature for Revelstoke. Through their efforts the Convention programme was prepared and a mineral exhibit was assembled comprising samples from practically every known British Columbia mining camp. The Canadian Consolidated Mining & Smelting Co. contributed a special display of the products of its smeltery. Mr. T. O. Bibb was in charge of the exhibition.

Mr. A. G. Langley on Prospects.

Mr. A. G. Langley, Provincial Resident Mining Engineer for the Revelstoke District, gave the first address, the subject being "Discovery and Development of Prospects." He said that the District had been prospected for gold, silver, lead and other minerals to some extent, but there was much to be accomplished. He sketched mining activity from the "eighties" in the Big Bend, Trout Lake, Ainsworth and other mining camps. Emphasis was laid on the importance, when a good find was located, of thoroughly prospecting the adjacent sections and valuable hints were given with reference to the finding of ores peculiar to the Kootenays of British Columbia. Dealing with development the speaker stated that the prospector and miner should not crosscut his course until he finds himself justified by his original findings. Too much work should not be done until it is definitely established that the ore is likely to be sufficiently valuable to warrant the expenditure of labor and money. Mr. Langley thought special attention should be paid to the development of

minerals especially required for war purposes and deprecated "wild-catting," asserting that mining, if carried out along proper lines, was a good investment.

Mr. Bruce White on Resources of Revelstoke District.

Mr. Bruce White, of Sandon, B.C., chairman of the Western Section of the Canadian Mining Institute, discussed "Geology and Mineral Resources of the Revelstoke District." Declaring that there were greater varieties of geological formations in this section than in any other part of British Columbia he said that even the rare metal, tin, was found in pegmatite rock on the headquarters of McDougall Creek. This pegmatite was an altered granite and quartz mixture and was of the pre-Cambrian age. Tungsten was likely to be found in this vicinity or might be associated with the tin in the form of scheelite. In the Trout Lake district manganese was in evidence while molybdenum, another war metal was found in several places along the Arrow Lakes in the altered granite formation but very little work had been done on them. The Big Bend Country, north of Revelstoke, had been well-known for over fifty years, its placer mining having first brought it into prominence. The speaker referred briefly to the Trout Lake and Lardeau District and its mineral riches and concluded by expressing the opinion that the Revelstoke District's possibilities were not realized and that all that was necessary to bring about notable development were men and capital.

Hon. John Hart on Taxation of Mines.

Hon. John Hart, Minister of Finance, took for his text "Taxation, as it affects the Mining Industry." He said, in part:

"For the benefit of those of you who have not had experience with British Columbia taxation of mines, I might state that until 1896 the output of mines was made a subject of personal property tax. In 1896 an amendment to the Taxation Act was passed placing mines and mineral in a separate class of property. The amendment stated that there shall be assessed, levied and collected from every person owning, working or leasing a mine, a tax of one per cent. on the assessed value of ore raised from the land, the value of the ore to be determined by smelter returns.

"In 1900 a further amendment was passed to the Act making the rate two per cent. on the ore produced, providing, however, that all ore producing mines not yielding a market value of \$5,000, and on placer or dredging not producing a gross value of \$2,000 in any one year shall be entitled to a refund of half the tax paid in the case of ore mines and of the whole tax in case of placer and dredging mines. The tax imposed by this amendment was in substitution for all taxes upon the land and upon personal property used in the working of said mines.

"In 1901 there was a further amendment stating that the owner of a mine shall be exempted from payment of income tax from income on mines. In 1902 a further amendment was put through to the effect that the gross output of placer or dredging mines to the value of \$2,000 should be exempt from taxation.

"In 1903 an amendment was carried, repealing the portion of the Act exempting mines from income tax; but substituting a clause that, in addition to exempting ore mines from income tax, coal mines also should be exempt from the income levy.

"In 1911 a Commission was appointed to revise the statutes and when its work was completed it was found that instead of having repealed the amendment of 1903 regarding the exemption of mines from income tax, part of it was left out, with the result that only coal mines were exempt from income tax. As there was no provision in the consolidated act to treat the two per cent. tax as being in substitution of all other taxes, the assessors in 1912 assessed the Granby Consolidated Mining & Smelting Co. and the Canadian Consolidated Mining & Smelting Co. on income. In 1913 the omission was corrected by an amendment and ore mines were again exempted from income tax. From the 1913 amendment to the 1917 amendment, mines were only taxed two per cent. on the output. This two per cent. tax for the year 1917 from all mines amounted to approximately \$285,000.

"When the present Government took office in 1916; the late Ralph Smith became Minister of Finance. He immediately commenced an investigation of taxation, particularly as to its effect on mining; but his untimely death lost to us the benefit of his experience and his researches. The late Mr. Brewster, who was then Premier, was obliged to take charge of the Finance Department temporarily and although he suggested amendments to the Act he had not sufficient time to supervise the details of the amendments and their effect on the mining industry with the result that the changes made were not considered equitable.

"In 1916 the rates of taxation were as follows:

- A. One per cent. taxable income up to \$2,000.
- B. Over \$2,000 and not over \$3,000, taxable income $1\frac{1}{4}$ per cent.
- C. Over \$3,000 and not over \$4,000, $1\frac{1}{2}$ per cent.
- D. Over \$4,000 and not over \$7,000, 2 per cent.
- E. Over \$7,000, taxable income $2\frac{1}{2}$ per cent.

"By Section II. of the Amendment Act, 1917, the clause exempting mines from income tax, inserted in 1913 was struck out, thereby bringing mining companies under the above scale of income tax, but in addition to this there was a sur-tax passed which imposed a further tax of one-half of one per cent. on incomes above \$3,000 and not exceeding \$4,000; two per cent. on incomes over \$4,000 but not exceeding \$7,000, and $2\frac{1}{2}$ per cent. on incomes above \$7,000; and further, there was a special Sur-tax of $7\frac{1}{2}$ per cent. on the excess of incomes over \$50,000. Therefore for 1917 the total income tax was 5 per cent. up to \$50,000 of taxable income and $12\frac{1}{2}$ on excess income above \$50,000.

"By a further amendment to the Taxation Act of 1917 the income tax for 1918 and until further amended is as follows:

- On taxable incomes not exceeding \$2,000, 1 per cent.
- Over \$2,000, not exceeding \$3,000, $1\frac{1}{4}$ per cent.
- Over \$3,000, not exceeding \$4,000, 2 per cent.
- Over \$4,000, not exceeding \$7,000, 4 per cent.
- Over \$7,000, not exceeding \$10,000, 5 per cent.
- Over \$10,000, not exceeding \$20,000, $7\frac{1}{2}$ per cent.
- Over \$20,000, 10 per cent.

"I took office of Minister of Finance in June, 1917. One of my first duties was to assess mining companies under the terms of the 1917 amendment and Sur-tax Act. On a close study of conditions I found that mining companies were taxed, not on profits, but nearly on gross income. In ascertaining the taxable income no deductions could be made for depreciation of plant, for development work or managers' or directors' salaries resident in the Province, while shareholders receiving dividends from mines were obliged to pay

further tax on such dividends and in addition to this the two per cent. ore tax had to be collected.

"After having explained in detail the drastic effect the enforcement of the Act would have on the mining industry, I was authorized not to assess under the Act as it then was, but to investigate and prepare amendments that would refine the Act to a more reasonable and equitable measure and make these retroactive to 1917.

"During the year 1917 and prior to the 1918 Session, I had many opportunities of discussing taxation of mines with representatives of mining interests and I can say that the point of view of the mining men was very forcibly placed before the Government. The Government realized from the outset of the conference with the mining men that they were not trying to evade a just and fair tax, but that they were anxious to assist us in the solution of the difficult problems with which we were confronted. On the other hand I think I am right in saying that the mining men soon realized that they had the sympathy of the Government and while we were anxious to increase our revenue we were determined not to do so at the risk of crippling the great industry of mining on which this Province depends so much for its progress and prosperity.

"During the Session of the British Columbia Legislature of 1918 I am pleased to say the whole of the suggestions of the mining men, with one exception, were crystallized into legislation. The following allowances or deductions were made:

In addition to administrative expenses and necessary expenditure made for mining, an allowance for depreciation of plant not exceeding 15 per cent. per annum of value.

Development work in connection with ore from which an income is derived.

Salaries of managers and directors who reside in the Province and who are liable for income tax themselves.

Dividends from mines are not again taxed, and in addition it was arranged not to collect income tax and the 2 per cent. ore tax but only whichever is the greater.

All these changes apply to the 1917 tax as well as to 1918 and have a very material effect on the amounts to be paid by the Companies.

"A little misunderstanding existed about the year's operations on which to base the returns. Some companies requested that they be allowed to pay taxes for 1917-18-19 on the basis of the 1917 returns, but when it was pointed out to them that provision was made in the Act to credit the 2 per cent. tax paid in the year that might be used as a base for income against said income tax they readily agreed to pay taxes for 1917 on 1915 balance sheet, for 1918 on 1916 balance sheet, and for 1919 on 1917 balance sheet, because by accepting this method their account for income tax for the 3 years would be credited with the 2 per cent. tax paid in the years 1915-16-17, while, if the tax for 1917-18-19 were based on the 1917 income, credit could only be had for the 2 per cent tax paid in that year.

"Gold mines were treated a little differently on account of the price of gold being fixed and the increased cost of production. The 2 per cent tax is struck out altogether, and they pay on their profits, without regard to whether or not the amount is greater than the 2 per cent. tax. The only other deduction that the mining companies can reasonably ask for is that the capital invested be allowed to earn a reasonable interest before profits are taxed, but this would also have

to apply to lumbering and other industries. We are in sympathy with the idea, but before arriving at a decision on the point we are waiting for complete returns from mining companies and other corporations, so that we may have sufficient information before us to see what effect such deductions would have on our revenue.

"It is hardly necessary for me to again repeat that Premier Oliver and the Government are determined that taxation shall not interfere with the progress of mining in this Province and when your returns are all in our possession we will give the matter our fullest consideration and study, so that adjustments may be made, if necessary."

Mr. R. Randolph Bruce, of the Paradise Mine, Windermere, followed with an acknowledgement of the courtesy and consideration given the representatives of the Mining Industry by the Government in discussions on taxation.

On Wednesday morning (July 10th) Mr. R. F. Green, M.P., spoke briefly and Mr. S. G. Blaylock, of Trail, B.C., assistant general manager of the Canadian Consolidated Mining and Smelting Co., gave an interesting address on "The Part Played in the War by the Trail Smelter." He spoke of the development of the lead and other branches of the smeltery since the outbreak of the war and made the statement that facilities had been provided for the handling of all the ores of the Province.

Hon. Wm. Sloan on Mining Industry of B.C.

Mr. A. B. Clabon, president of the Vancouver Chamber of Mines, took for his subject "The Value of the Mining Industry" and in the afternoon Hon. Wm. Sloan, Minister of Mines, delivered a spirited speech on "British Columbia, the Mineral Province." He extended a special welcome to the visitors from the United States, speaking of the value of co-operation and of the fact that at such a time, when Canadians and Americans were fighting shoulder to shoulder against the common enemy, their fellow-countymen at home should and would "do their bit" by pooling their interests, so to speak and by concerted effort attain the maximum output of those materials essential to the successful prosecution of the war. He traced the development of the mining industry in British Columbia from 1848 when the Hudson's Bay Co. first mined coal on Vancouver Island. Since then \$170,000,000 worth of coal had been dug up in the Province. British Columbia, contemptuously referred to as a "Sea of Mountains," had yielded \$80,000,000 in quartz mining in the last three years. California mining wealth had produced a record of \$37 per capita whilst British Columbia had a record of \$115 per capita and its resources were only scratched. He dealt with what the Government had done to assist the prospector and with taxation, "taxation and legislation" being referred to as the bugbear of the miners. Personally, he disapproved of the 2 per cent. tax, favoring taxation on the net income of the mines. Reference also was made by the minister to the Government's policy of encouraging the development of the iron ore resources of the country. British Columbia, he said, lacked experimental plants. What was wanted was a plant combining both the commercial and the experimental and the Federal and British Columbia Governments would work towards the establishment of such a plant.

"Northwest Kootenay" was the title of an address by Mr. Orville Young, M.E., of Golden, B.C.

Mr. F. A. Starkey, of Nelson, B.C., President of the Eastern British Columbia Associated Boards of Trade,

subject being "Closer Co-Operation Between Boards of Trade and Mining Organizations." He regretted the lack of a better understanding between the mine-owners and the Trail Smeltery and thought that the former by presenting a united front would be able to obtain redress from the smeltermen.

Before the noon adjournment a Resolution Committee was appointed, composed of Messrs. R. Randolph Bruce, Golden, B.C.; Sidney Norman, Spokane, Wash.; Andrew M. Craig, Trout Lake, B.C.; F. A. Starkey, Nelson, B.C.; and J. W. Evans, Revelstoke, B.C.

The prospectors' luncheon which followed and of which nearly one hundred delegates partook, was unique as well as appetizing, features of the menu being bacon, beans and bannock.

In the absence of Mr. Thomas French, manager of the French Complex Ore Reduction Co., Nelson, B.C., his paper on "Some Notes on the Smelter Situation in British Columbia," was read by Mr. F. B. Hill, the Convention secretary. A vigorous address strongly protesting against the evils of the smelter trust was delivered by Mr. Sidney Norman, editor of the "Northwest Mining Truth" and the representative, on this occasion, of the Spokane Chamber of Commerce.

Mr. J. J. Warren on Smeltery Problems.

Mr. J. J. Warren, of Trail, B.C., president of the Canadian Consolidated Mining and Smelting Co., whose address was entitled "Some Smelting Problems under War-time Conditions," summed up the difficulties with which the smelter has had to contend and warmly defended its management against statements made by some of the speakers. He spoke of the difficulty of finding labor, of the increased cost of production for various reasons among those cited being coal strikes, which restricted operations, and of the problem of fixing smelting rates. In regard to the latter, he instanced the inability of the mine operators to supply the lead demand of the winters of 1916 and 1917, as a result of which an effort had to be made to meet the demand from the American side. When, however, war needs were satisfied the smelter found itself without a market, and, the lead market having collapsed, the smelter had a surplus on its hands. Shortage of clean lead in British Columbia for smelting purposes was the great difficulty. He resented the suggestion that the company was not treating the mine operators fairly. If it was to be subjected to Government regulation the same action should be taken with saw-mills and flour mills. The smelter was ready to treat lead at \$1.00 over cost, which, he believed, was a better rate than was quoted by any other smelter on the continent.

Mr. Charles F. Caldwell, of Nelson, B.C., president and manager of the Utica Mines and President of the Kootenay Mine Owners' Association, outlined the claims of the mine owners of the Kootenay District with respect to smelting rates and asked for the sympathy and the support of the Convention and the Boards of Trade of British Columbia.

In closing the Convention considered the following resolution, in addition to passing those of the usual formal character:

"That inasmuch as the Consolidated Mining and Smelting Company is treating custom ores and may be considered a public utility; that a Royal Commission be appointed to investigate and regulate treatment and smelter charges, guaranteeing fair and equal treatment to all producers."

It was decided, on amendment, to defer action pending consideration of the matter by the Associated

How the Trail Smelter Has Helped to Win the War

One of the features of the discussion which took place at the Annual Northwest Mining Convention held at Revelstoke, B.C., from July 9 to 12, was Mr. S. G. Blaylock's address on "The Part Played in the War by the Trail Smelter." Because of his position as assistant General Manager of the Consolidated Mining & Smelting Co. and owing to his high standing in British Columbia mining circles his observations were based on an intimate knowledge of his subject and were listened to with profound attention.

He said that no better illustration of the work done for the British Empire by the company could be found than the giving of a rough outline of the zinc industry. The problem to be solved was how to separate the zinc from the lead in ores. Although this matter had received close attention and endless experiments had been made, when the war broke out the company was only making one half ton of zinc a day. To quote Mr. Blaylock:

"The Imperial Munitions Board was in dire need of high grade zinc, which was selling at from 35 to 45 cents a pound, when obtained at all. Besides this, it appeared to be cornered by our enemies. It was on this account that the company agreed to build a plant, based on our experimental work, to make twenty tons of zinc a day, at a price of 15 cents a pound, or less than one-half of the current price. This was rapidly followed by demands for a larger and a still larger production, but at the same price a pound of zinc.

"Before the plant could be designed and orders placed, preliminary quotations on many things were doubled.

"The plant required proved to be more extensive than was originally thought sufficient. Sulphuric acid was prohibitive in price, necessitating the installation of a sulphuric acid plant, and many other difficulties arose and were overcome, till finally the plant was completed and in operation. Hundreds of difficulties were experienced when the big plant started which did not show up in the small experimental unit. These were met and surmounted by the most incessant work of those in charge.

"Some of the main points of the process as carried out are the counter-current leaching, the neutral solution by addition of an excess of ore—in other words, a double leach; the drastic purification of solution; the development of suitable pumps and air lifts for handling solids and solutions; the proper content of the electrolytic tanks to prevent the breaking up of the electrolysis and the formation of hydrogen; and also the keeping down of the volatile and the development of efficient melting furnaces.

"Much work has been done on the residues and we feel that we soon will be in a position to treat these successfully, the trouble to date being to get the zinc in these tails sufficiently low to allow of their profitable treatment for lead and silver.

"The Government aided in financing the company to the extent of lending about 30 per cent. of the money necessary to build the plant. This money, however, was merely a loan and has to be repaid in full. A bounty was also promised and has been extended, which would ensure a price 2 cents a pound better than the price of prime western spelter, unless the price of this grade was 9 cents a pound."

It, therefore, will be seen that the starting of this electrolysis plant at Trail, B.C., together with that

which was established almost simultaneously at Anaconda, Montana, had a strong bearing, and probably was the determining factor, in the bearing of the German hold on high-grade zinc.

Mr. Blaylock, continuing, said that in order to assure the greatest possible output of lead for the Imperial Munitions Board, the company took all the customs ore offered in the country until the Board notified the company that it could handle no more. In order to accommodate this customs ore, which had increased from less than thirty tons a day, when the metal markets were low at the start of the war, to over 200 tons a day, when metals were high immediately prior to the cancellation of their contract by the Munitions Board, it was necessary to curtail shipments from the company's own properties to a minimum, thus losing the advantage of the high price of lead, but contributing greatly to the ultimate winning of the war.

In enumerating some of the calls made on the company during the crisis, Mr. Blaylock said:

"The Consolidated was also requested to build a refinery for the production of copper. While this refinery is comparatively small, its building and operation in conjunction with the necessary converter plant was a large undertaking for a company which had lost so many of its best employees who had answered the country's call for men to go overseas."

GRANBY COMPANY INCREASES WAGES.

The Granby Consolidated Mining & Smelting Co. has advanced wages to all employees at its smelter 25 cents a day as from the 1st of July. The increase was the result of the rise in the price of copper, which went recently from 23½ to 26 cents a pound, and is in accordance with an agreement between the Granby Company and its men. The men now receive \$1.25 a day above the normal wages, which are based on copper at 16 cents. Although copper has been 23½ cents for the past year the company has paid its men on a basis of 24 cent copper.

GRANBY EMPLOYEES ON STRIKE.

About 2,000 men are affected by a strike declared by employees of the Granby Consolidated Mining and Smelting Co. at Anyox, B.C., the mining and smelting centre of that company in British Columbia. An increase of \$1 a day all round is the men's demand. The management of the company, in a statement issued immediately following the trouble, allege that it was fomented by I.W.W. agents. It is maintained that the wages paid are as high, or higher, than are paid anywhere else in America for the same service. Common laborers receive \$4.75 for eight hours, which is claimed to be higher than is given anywhere else in the Province. Ninety per cent of the men, it is stated, are living in the rooming houses and eating at the mess houses, where their living only costs \$7.50 per month more than it did before the war. Their wages have been increased \$50 to \$60 a month. In this respect they are better off than the married men, although the latter, because of the fact that the company is selling supplies through its store at less than retail prices elsewhere, are able to live comparatively cheaply. The foregoing is taken from the company's statement, which adds that the wage increase during the past four years is double the increase in the cost of living. At the time of writing (July 23rd) the men appeared to be determined and were being supported in Vancouver, B.C., where notices had been posted at labor headquarters warning workers to remain away from Anyox during the strike.

International Nickel Co.'s Refinery at Port Colborne

On July 1st, 1918, the plant of the International Nickel Company of Canada, was put into operation for the treatment of nickel-copper matte. A large supply of matte has been shipped to this refinery during recent months from Copper Cliff, where it is produced at the smelter of the Canadian Copper Company. The bins have also been well stocked with fuels and salt cake. The first operation—smelting the matte with salt cake—is now being carried out in one of the three furnaces. It will take a few weeks to fill up the plant, and then the production of refined nickel on a large scale will have begun. The plant was designed to produce about fifteen million pounds of nickel per year. There will

The Foundation Company, Ltd., of Montreal, had charge of the entire construction. From four to nine hundred men were employed on this work. The buildings are of steel and brick construction. The Dominion Bridge Company, of Montreal, supplied, fabricated and erected the steel—about 10,000,000 pounds. About 51,000 tons of concrete and 6,000,000 bricks were used on the work.

The first view of the works shows two enormous and three smaller stacks rising from a well-laid group of brick buildings. Approaching the plant from Port Colborne, we find a handsome office at the end of a court flanked on either side by very attractive club-lodging

The new nickel refinery at Port Colborne, Ont.

be produced at the same time about half this amount of copper. There is at present no provision for recovering the precious metals at the Port Colborne plant, and the slimes will be sent to the New Jersey refinery of the International Nickel Company for treatment.

The site selected for the refinery is at Port Colborne, adjoining that of the Canadian Furnace Company. It is close to the Welland Canal and to a branch line of the Grand Trunk Railway. Port Colborne is on Lake Erie at the entrance to the Welland Canal, and the transportation of fuels by water will, therefore, be possible.

houses. At the left of the office is the hospital and time-recording office. At the right is the laboratory building.

The railway sidings enter the yard from the north, the main supply line leading to the bins at the east side of the furnace building. The approach to the bins is over a very substantial concrete trestle. From these bins the matte, fuel and salt cake are loaded into cars resting in pits in the concrete floor of the building. These cars are hoisted to the feeding floor.

The furnace building is a large one—746 ft. by 125 ft. It houses three blast furnaces and three converter

stands. These are served by seven travelling cranes—two five-ton, 30-ft. span; three 2-trolley, 20-ton, 85-ft. span; one 2-trolley, 35-ton, 85-ft. span, and one single-trolley, 50-ton, 85-ft. span. The furnace stack is an enormous one—365 ft. high.

A similar large stack serves the roasting furnaces. There are 10 of these in the oxide department.

In the refining building are two refining furnaces with waste heat boilers. One 15 ton 2-hoist and one 5-ton single-hoist cranes serve the furnaces. There are two stacks 100 ft. high.

The power house contains four 400 h.p. boilers with chain grate stokers and two 1,000 k.w. turbo generators. A very complete Cottrell precipitation plant treats the fumes from the furnaces.

Altogether the plant is a very imposing one. It is the result of careful planning after long experience.

PERSONAL

Mr. Thomas Taylor, formerly overman at the No. 5 Mine, Comox Colliery, operated by the Canadian Collieries (D), Ltd., has accepted a position as overman of the Morden Mine, operated by the Pacific Coast Coal Mines at South Wellington, B.C.

Mr. W. H. Moore, formerly safety inspector for the Canadian Western Fuel Co., has been appointed manager of the new Wakesiah Mine, now being opened by the same company.

Mr. J. Jemson,, overman of the South Side No. 1 Mine, Nanaimo Colliery, operated by the Canadian Western Fuel Co., has been appointed Safety Inspector to succeed W. H. Moore in that position, and Robert Laid has been made overman to succeed Mr. Jemson.

The new nickel refinery at Port Colborne, Ont.

The contractors have done their work well and it is reasonable to expect that the plant will prove so suitable for its work that it will be extended so that all the refining for the International Nickel Company will eventually be done at Port Colborne.

We have given here only a brief account in order to give our readers some idea of what the buildings shown on these pages contain. In a later issue we will present a more technical description of the plant and its construction.

Mr. John More is general manager and Mr. James T. Kemp assistant general manager at the Port Colborne plant. There are at present about 350 men employed.

Col. Jos. W. Boyle, who has been doing important work for the Allies in Russia, has been decorated by the King of Roumania for saving a number of Roumanians from exile and probably death at the hands of Russian Bolsheviks.

Major R. W. Brock has been appointed geological expert in Palestine by the British Government.

Prof. R. C. Wallace has been appointed Commissioner for Northern Manitoba.

Prof. J. S. DeLury of the University of Manitoba was in Toronto last week.

Mr. E. J. Collins, of Duluth, visited the Flin-Flour district, Manitoba, last week.

INVESTIGATION OF SMELTERY CHARGES IN BRITISH COLUMBIA.

The promised investigation into the affairs of the Canadian Consolidated Mining and Smelting Co., with special reference to its schedule of charges in connection with the Trail Smelter, still hangs fire. Over a month ago it was thought that the inquiry would proceed, a committee, appointed by the Associated Boards of Trade of British Columbia, having been endorsed by the Dominion Government, which evinced its practical interest by retaining Mr. E. R. Whittaker, of Denver, Colorado, the mining engineer who compiled a report of a recent commission appointed to deal with similar business in Colorado, and also voted \$3,000 towards the expenses likely to be incurred. Messrs. S. S. Fowler, Ivan de Lashmutt, and James Anderson were those named; Mr. W. E. Zwicky being selected to act in an advisory capacity. There was some delay in getting the committee together following the Dominion Government's action, owing to the illness of Mr. Fowler, but finally a meeting took place. The deliberations were short, coming to an untimely conclusion, when it was found that \$3,000 would be much too little to carry through the work and that the committee had no authority to hear sworn testimony. It was decided, therefore, to petition the Dominion Government to appoint a Royal Commission, with power to go fully into all disputed points as between the company and the mine operators of the Province. To make a thorough inquiry, it is the opinion that \$10,000 at least will be wanted, and the Government has been asked for such an appropriation. While nothing definite has been learned, reports of an authoritative character have been circulated to the effect that the Federal authorities have decided to accede to the demands of the operators and that the Commission will be established in a short time. It may be said incidentally that the recent action of the Dominion Government in setting aside \$400,000 to provide for what is termed a bounty on the production of zinc in Canada has resulted in the development of a somewhat stronger feeling against the Canadian Consolidated Company, because the latter will obtain the entire benefit. Operators of mines which produce ore carrying large percentages of zinc, maintain that the Government vote should be termed a subsidy, as it will go altogether to the company. On the other hand, it is argued that, as the company went to considerable expense in the installation of its electrolytic plant, it is entitled to the support granted. The mine owners contend that the stimulation of the production of zinc should have been carried out as was that of lead, namely, by the granting of a bounty on the basis of the zinc contents of the ore mined, the same to be established by assay.

McGILLIVRAY COAL AND COKE CO.

At the annual meeting of the McGillivray Coal and Coke Company held at Coleman, Alberta, recently, Mr. Lorne A. Campbell, formerly Minister of Mines for British Columbia, was re-elected president; Mr. J. A. Newell, of St. Paul, Minn., vice-president; and Mr. C. B. Smith, secretary-treasurer. The officers, with Mr. Henry L. Simons, of Glencoe, Minn., and Mr. Fitzhugh Burns, of St. Paul, Minn., were elected to the directorate. Much of the stock of this company is held in Spokane, Wash., and the adjacent district.

VANCOUVER ISLAND COLLIERIES ARE PERMITTED TO RAISE PRICE OF COAL.

Permission has been granted by Fuel Controller C. A. McGrath of Canada to the following Vancouver Island (B.C.) Collieries to advance the selling price of their coal seventy-five cents per gross ton: Canadian Collieries (Dunsmuir) Ltd., The Pacific Coast Coal Mines, Ltd., The Nanoose Collieries, Ltd.

The maximum allowed heretofore at the mines has been \$5.80 per gross ton and to this the Canadian Western Fuel Co., Ltd., at present the largest of the Island producers, is held by the ruling of the fuel administrators.

An application for this concession was made to Fuel Controller McGrath by the operators some months ago and, pursuant to the policy inaugurated in the Provinces of Nova Scotia and New Brunswick, an investigation of costs and of general conditions was ordered and entrusted to Mr. Kerr, the Fuel Control Auditor; and Mr. Nichol Thompson, Fuel Administrator for British Columbia. In carrying out the inquiry they had the co-operation of Mr. George Wilkinson, Chief Inspector of Mines for British Columbia.

The announcement of the advance authorized was accompanied by a statement, one paragraph of which explains the action of the Administrators in differentiating between collieries, the most notable instance of which is the withholding of permission to the Western Canadian Fuel Company to increase prices at the mine. This paragraph follows:

"As can readily be appreciated, some coal operators are placed very favorably as compared with others in the same province. This may be due to better coal seams or other more advantageous conditions attending the practical operations. The Fuel Controller fully realizes that the country requires all the coal that can be produced. At the same time he has decided that in granting permission to increase the selling prices, there will be allowed only fair and reasonable profits. The result is that in order to procure the best possible output and at the same time to avoid any operator making undue profits, it has been necessary in some instances to have different prices prevail at different collieries which supply the same markets. In the case of the operators on Vancouver Island a differentiation in prices has been necessary in order to meet the situation there."

OPENING SMALL COAL MINES TO SUPPLY LOCAL TRADE.

The present demand for coal, and the prospect of a much greater demand in the course of the next few months, has led to an interesting development in both Alberta and British Columbia. Coal properties are being opened up by individual miners in both Provinces and are giving their enterprising operators good returns. There are quite a number of these propositions in Alberta, a few men being engaged in the summer in digging the lignite coal, which, in the winter, is carted over the snow by sleigh to the farmers and other residents within reach. In British Columbia a bituminous mine has been opened on the line of the Grand Trunk Pacific Railway and a short distance from the city of Prince Rupert. It is being worked by a few coal miners who are looking forward to supplying the Prince Rupert market this winter, the proximity of the property to the city making it possible to effect delivery at a much cheaper rate than it can be obtained from the mines of Vancouver Island and of other sections of the Province.

R. C. WALLACE IS COMMISSIONER OF NORTHERN MANITOBA.

The Pas, Man., July 12.—Professor R. C. Wallace, M.A., D.S., Ph.D., head of the Department of Geology and Mineralogy of the University of Manitoba, has been appointed to succeed John A. Campbell, member of Parliament for Nelson, as commissioner of Northern Manitoba.

Prof. Wallace is well known by miners and mining men generally throughout the Northland, having been through the whole known mineral district adjacent to The Pas. His reports to Government of researches in Northern Manitoba have been very favorable to this region as a positive mining centre, only awaiting development.

Other duties pertaining to the office are the supervision of education, of health and to act as a judge where necessary. His jurisdiction covers an area of nearly 200,000 square miles.

Professor Wallace and his family will take up their residence in The Pas after December 1st, on which date he assumes his new duties.

IVANHOE MINE, B.C.

The Rosebery-Surprise mining company is reported to have taken a bond on the Ivanhoe Group, the property of the Minnesota Silver Co., largely owned by Mr. W. H. Yawkey, of New York. The deal includes the concentrator which was put up by the Surprise company, under agreement with the Minnesota Silver Co., to replace the mill destroyed by fire several years ago. Work on the Ivanhoe has been started by the Rosebery-Surprise forces according to a statement by Mr. McFadden, the manager, who adds that negotiations are under way for the acquisition of the Canadian group, adjoining the Ivanhoe, and owned by Brandon Bros., of Silverton. Mr. D. McKenzie, formerly superintendent of the Ruth Mines, will be in charge of operations at the Ivanhoe. Considerable shipments were made from the Ivanhoe several years ago, but the mine did not prove profitable under the then prices of metals. Most of the mine product is milling ore.

UNDERSTANDING BETWEEN GRANBY AND CANADIAN COLLIERIES.

It is understood that the Canadian Collieries (Dunsmuir), Ltd., and the Granby Consolidated Mining & Smelting Co., Ltd., either have or are about at the point of reaching an agreement as to the coal lands in dispute situated in the Esquimalt & Nanaimo Ry. Belt on Vancouver Island, British Columbia. These lands, as has been explained previously, are held by the Granby Company under title from the Province, which title was acquired from certain settlers who secured it by virtue of the Settlers' Rights Amendment Act, 1917. Subsequently this Act was disallowed by the Dominion Government, and the Canadian Collieries Co. claimed title, having acquired the Island coal lands granted to the E. & N. Ry. Co. in 1884. Believing their title sound, the Granby Co. had prospected for and found coal. They then went to an expense of approximately \$300,000 in opening up the seams and in installation of plant on the ground. Further outlay was undertaken in the installation of by-product coking ovens at Anyox, B.C., where it is proposed making coal from the Island coal for the Company's smelters. It was feared that the Dominion Government's action would result in the cessation of this development while the two companies engaged in a lengthy law-suit to

concerns are likely to arrive at a mutually satisfactory agreement is welcomed in British Columbia.

PLATINUM ON KASLO RIVER PROPERTY.

Norquist Brothers, of Spokane and Seattle, owners of the Gum and Nome group of claims on the south fork of the Kaslo River, are credited with having made the important discovery that their property has possibilities as a platinum producer. Twenty years work and \$28,000 are said to have been expended in a vain effort to prove a silver mine, hundreds of feet of tunnel being driven in the course of which good showings repeatedly were found and lost. Last year the owners despaired and were contemplating abandoning the claims. At this point one took a sample of what seemed to be peculiar rock which projected from the face of the drift. He had it analyzed and, report has it that the returns showed the occurrence of platinum to the extent of about \$700 to the ton. A little of this at the prevailing price of \$105 per ounce would soon wipe out the property's indebtedness and the owners have reopened with renewed optimism.

The Rex Mine have made their second monthly shipment of bullion, amounting to over \$6,000. The drift in the 100-ft. level is now 130 ft. south of the shaft, and the vein is six feet in width. The ore continues to show its usual consistent satisfactory gold content.

Archie Close has almost completed the enlargement of the shaft on the Northern Manitoba Co.'s property, and expects to start work on the sinking of the shaft next week.

Mr. Cram, of Rossland, B.C., and J. MacCutcheon, returned from Herb and Elbow Lakes on Friday, with samples from various properties around Herb Lake. Paul Gasse came in also, and is now negotiating with Eastern capitalists, with a view to granting them an option on his property. Hugh Vickers located a rich, small vein about a mile north-east of the new find. Samples show much free gold. John W. Callinan is in from Flin-Flon district. J. G. Cameron, of Regina, arrived in town the beginning of this week, and has gone north to Copper Lake, north of Cranberry. He has copper propertites in that locality. Six carloads of copper ore from the Mandy Mine were sent to B.C. on Wednesday's train. About 750 tons of Mandy Mine ore came down this week.—The Pas Herald.

STRONTIANITE DEPOSITS ON ASHNOLA RIVER, B.C.

Deposits of strontianite have been found on the lower Ashnola River, B.C. No development work of consequence has been done as yet, but the discoverers believe that there is a considerable body of the ore. Owing to the special uses to which the mineral is being put within the war area, its value as a means of signalling being one of the most notable, the prospect has attracted more than usual attention.

On account of the cutting off of the supply of platinum from the Urals, Great Britain and her Allies are now forced to look to other sources for that metal which is so urgently needed for war purposes. In order to stimulate production in Canada, the Department of Mines, the Honorable Martin Burrell, Minister, has arranged for the purchase of platinum at the Dominion Assay Office, which the Department maintains in Vancouver. The establishment of this purchasing agency will be a great convenience to miners, particularly to small producers, who heretofore have had to market their product in the United States with con-

COAL MINER ACCUSED OF DRAWING DOUBLE PAY.

A criminal action was heard in the coal mining town of Fernie, B.C., last week, which created something of a furore there and held the attention of coal mine operators and coal miners throughout the province. The circumstances, in a few words, were that a miner employed by the Crow's Nest Pass Coal Company was accused of loading a number of cars and placing his tally check thereon while supposed to be on company work and paid by the company. Thus he got double-pay—pay at the stated rate for company work and pay, under the contract system, for the coal loaded which in the ordinary way was credited to him. Witnesses for the defence testified in effect that it frequently happened, so frequently as to be almost a custom, that sub-officials would allow contract miners, while working on company time, credit for coal loaded by time on contract basis in addition to the regular schedule for the company shift. It was alleged that the motive for this was to "speed-up" the work by hastening the expeditious completion of necessary work and avoiding undue interference with production. On the other hand company officials and sub-officials entered an emphatic denial of the existence of such a system. The secretary of the local union declared that it was a common practice, but repudiated it, stating that it was not done with the approval of union officials. The Court in fining the accused \$100 or six months in jail said: "If this custom did exist, it is a criminal one. I do not care if a few overmen or fire-bosses connived with the workmen; it was a criminal one undoubtedly. I do not share Mr. Phillips' (witness for the defence) Bolsheviki idea that it is all right to steal from your employer, but not from your fellow worker. I do not think any right thinking man will agree. But, as I say, if it was a custom, it was a criminal one and one a man should be punished for."

WESTERN CANADA'S COAL SUPPLY.

The question of next winter's coal supply begins to loom large in the minds of the citizens of Winnipeg, Manitoba, and other parts of that Province, as well as of Saskatchewan. A few weeks ago a committee representing the city of Winnipeg visited Calgary, Alberta, for the purpose of going into the matter of coal costs with the operators of the latter Province, it being contended that, if Manitoba is expected to use Alberta coal, it will have to be put on the market at a cheaper rate than the present retail price, namely, from \$11.50 to \$12 a ton. The delegates do not appear to be satisfied with the results achieved, stating that the operators did not evince a willingness to assist in their work, nor to show any strong desire to establish their product in the markets of Manitoba. The information they got was summed up as follows: That the coal costs on cars at the mine was \$4.95; that the freight to Winnipeg was \$4.15; and that administration and cartage accounted for another \$2. In the face of this, it is admitted that there does not seem to be any indication of profiteering; but the members of the committee expressed disappointment that the mine owners had not thrown open their books for inspection in order that these statements might be confirmed. The difficulty, however, was agreed to be the high freight charges and Mr. S. C. Oxton, deputy minister of public works, Manitoba, and Mr. J. A. McDonald, acting fuel administrator for the Province of Manitoba, recently interviewed the fuel administrators of Alberta with a view to finding some means of bringing about a reduction in the transporta-

toba are debating whether it would not be as cheap to pay \$14 a ton for the high-class anthracite of the U. S. as against about \$12 for the bituminous coal of Alberta. There is no doubt what their decision would be, but for the fact that they have been cautioned that the United States this winter will have use for its full production of coal and that the prospect is that there will be little available for export to Canada.

In answer to the statements of the Winnipeg representatives, Mr. Jesse Gouge, one of the operators of the Drumheller field, Alberta, states that, if they return and state that Alberta coal costs \$4.95 a ton, they will not be telling the whole truth. He adds: "Four dollars and ninety-five cents is the maximum price for the very highest grade double-screened coal produced in the Drumheller field. Good coal, mine run, can be purchased for \$3.35 a ton; good lump coal, run over single screen, at from \$4.50 to \$4.65 a ton; good screen coal may be had for \$3.75 a ton; nut, screened coal for \$2.40, and steam coal, good for boilers and for heating big buildings, may be had at from 25 cents to \$1 a ton." Mr. Gouge further pointed out that Winnipeg had use for all grades of coal, just as was the case in Calgary, and that coal costing only 25 cents a ton was being used in the Calgary City Power Plant. As to the charge that the committee members were not allowed to inspect the operators' cost book, he stated that it would have been absurd to permit men with little knowledge of coal and no authority outside of the City Council of Winnipeg such a privilege as the likely result would be the dissemination of misinformation. The owners were quite willing to throw open their records to a properly constituted Government body.

LADYSMITH SMELTER.

Some weeks ago it was stated in these columns on the authority of Mr. W. J. Rattle, general manager of the Ladysmith Smelter Corporation, that this British Columbia Smelter would be blown-in after some months of inactivity on the 20th of June, 1918. Because it was not possible to arrange definitely for a continuous supply of ore that programme was not carried out; but it now is stated that preparations are practically complete for the re-opening of the smelter with good assurance that its furnaces will be kept busy. The date now selected is the 29th of July. Besides being reported to have a bond on the Willow Grouse Mine, Cowichan Lake, the Ladysmith Corporation has secured the Girtwood Mine on Latouche Island, Southeastern Alaska. The latter is an old producer and in the past has shipped regularly to the Tacoma Smelter, its average for considerable periods being 1,000 tons a month. The property joins the Beatson, owned by the Guggenheim interests, and by reason of being near tidewater the transportation is simple.

THE WAKESIAH—A NEW COAL MINE.

The Canadian Western Fuel Co.'s new mine, situated near Nanaimo, B.C., and two shafts of which are being sunk to tap the famous Wellington Seam, will be known as the Wakesiah Mine. To reach the seam, the shafts must be sunk 350 feet. The concrete collars are in, and sinking has progressed to a depth of about 50 feet in the hoisting shaft. Plans have been prepared for the various buildings and machinery and mine yards. The mine will be up to date in every respect, and will be shipping coal before the end of the year. The company has three other producing mines, yielding a monthly tonnage of approximately 65,000 tons, and mining from three seams—the Douglas, Newcastle

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

Rocher de Boule Strikes High Grade.

A shoot of ore of high grade, about seventeen feet in width, is said to have been struck by the Rocher de Boule Mining Co. on its property at New Hazelton, B.C. In the effort to locate this ore, a low-level tunnel was driven without result, but a streak of ore was noticed, and it was decided to raise on this. The shoot was encountered at an elevation of about 160 feet above the main level and, according to report, it has a great prospective value. A mill is to be erected to treat the lower grade of ore.

Prospecting for Platinum.

With further reference to prospecting for platinum in Western Canada, it is authoritatively reported that the Munition Resources Commission of the Dominion Government has a drill at work on the Saskatchewan River and another on the Peace River in British Columbia. The Tulameen River, of this Province, is to be thoroughly tested, two drills being on the way for operation there. It is understood that there already are two drills at work in the placer ground of this river.

Shipments to Trail Increase.

That the mining industry in British Columbia has been picking up in the last few weeks is indicated by the returns from the Trail Smelter for the week ending June 30th. These showed that 6,510 tons was received for treatment as compared with 3,233 tons for the week ending June 21st. The shipments by districts follow: Rossland, 1,807; Slocan and Ainsworth, 1,102; Nelson, 97; Boundary, 730; East Kootenay, 1,462; other mines, 96; American mines, 1,216.

Authoritative reports indicate that there is only a difference of 119 tons in the quantity of ore received by the Trail Smelter for treatment during the first six months of 1917 and the first half of the present year. The figures are: First half 1917, 179,493 tons; first half 1918, 179,274 tons. This showing is surprising, because the Rossland mines have been practically closed down, and there was a period of market depression and inactivity as far as the lead-silver-zinc mines of the Boundary, Slocan and Kootenay districts of the Province. It is thought likely that the revival, which is very evident at present, will result in much larger shipments over the remainder of the year and thus bring British Columbia's total production further up than was expected. The shipments by months follow:

	1917.	1918.
January	36,570	27,404
February	40,967	33,989
March	42,949	41,725
April	25,909	37,029
May	15,969	21,162
June	15,969	21,162

Totals 179,493 179,274

Prospectors Are Staking Claims Near Olivine Mountain

With further reference to the prospecting in progress in British Columbia for platinum Mr. Eugene Poitevin, a mineralogist attached to the Department of Mines, Ottawa, has returned after spending a few weeks at Olivine Mountain, near Tulameen, B.C. It is hoped that the source of both the gold and platinum of the Tulameen River placer ground will be found, as the character of what is being recovered along the rivers and streams of the district indicates that it has not

been carried a great distance. It is suggested that the Dominion Government may place a diamond drill in operation to prove some of the outcroppings in the mountain. That general interest has been aroused in the work is shown by the fact that there are many prospectors camped along the Tulameen river in close proximity to the mountain, and that quite a number of claims have been staked.

Western Gold Production Falling.

That some action should be taken by the State to encourage the production of gold is the consensus of opinion in British Columbia, where the effect of the ever-increasing cost of mining and of the augmented values of most minerals, with, of course, the exception of gold, has been felt to a serious extent. A notable case in point is the closing down of the Rossland Mines by the Canadian Consolidated Mining & Smelting Co. It is felt that, under the exceptional conditions, some effort should be made to maintain the output of gold, which is steadily declining in this Province. This is conclusively shown by the figures contained in the 1917 report of the Minister of Mines, as follows:—

British Columbia's output of placer and lode gold for the years 1915, 1916 and 1917: 1915, Placer 38,500 oz., value \$770,000; Lode, 250,021 oz., value \$5,167,934. 1916, Placer \$29,025 oz., value \$580,500; Lode 221,932 oz., value \$4,587,334. 1917, Placer 24,800 oz., value \$496,000; Lode, 114,523 oz., value \$2,367,190.

For this reason, a resolution passed by the Northwest Mining Association recently at a specially-called meeting, held at Spokane, Wash., meets with hearty approval here. The resolution is very clear in its terms and, while it refers specifically to conditions as they are in the United States, the principle enunciated is applicable and is accepted among mining men and those who have given the matter intelligent consideration in Canada. It follows:—

“That all war taxes be remitted insofar as they affect gold mining; That the present advance in freight rates be abrogated in respect to the gold mines that are unable to operate at a profit under the present rates; That commercially inaccessible gold properties of merit be made accessible through the building of motor roads; That the gold mining industry be placed on the same basis as other war industries in respect to financial assistance, to be extended through the war finance corporation or by means of re-discounts through the federal reserve bank, or through any other means that may be devised; That operators of gold properties be given Government guaranty, instead of a bonus, which guaranty shall assure to gold mine operators profits commensurate with those that would have accrued to them under the pre-war conditions and prices of labor, supplies, taxes and other items of general expense; That any and all Acts of the Government directed to the financial aid of the gold mining industry, as above set forth, shall be subject to the examinations, reports and recommendations of properly qualified mining and accounting experts acting on behalf of the Government; That copies of these resolutions be forwarded to Secretary McAdoo and to the senators and representatives of the various mining states.”

Britannia Mine.

At Britannia Mine the new mill is reported to be handling between 2,200 and 2,300 tons of ore a day. It is reported to be one of the most efficient on the continent, being credited with an extraction of between 94 and 95 per cent. The company has opened what is termed Mammoth Bluff as a quarry which marks the

commencement of the mining of Britannia Mountain. The greatest problem in connection with the operations is the shortage of labor. There now are only approximately 850 men on the pay-roll, as against a normal pay-roll of 1,000. The company is planning to place its entire system of ore transportation underground.

Oil Prospecting in British Columbia.

Considerable interest is being taken in oil prospecting in British Columbia. Had it not been for the untimely death of Mr. B. T. Rogers, capitalist, of Vancouver, B.C., work would have gone forward in the sinking of a test hole at Burnaby, where there are oil seepages. It is reported by the Empire Oil and Natural Gas Co., Ltd., that a drill has been sunk to a depth of about 400 feet at Aldergrove, B.C., the latest log showing a sandy shale. There have been two companies organized at Vancouver, namely, the Boundary Bay Oil Company, Ltd., and the Burnaby Oil Co., Ltd. The former intends to test by drilling an area at Boundary Bay and the latter to carry out work at Vancouver Heights. The possibilities of Graham Island, of the Queen Charlotte group, also are engaging attention. It is understood that the Geological Survey Station proposes this summer to make a thorough examination of the Fraser Valley, so as to establish at what point a drill would be most likely to strike oil in commercial quantities.

Annual Report of Minister of Mines.

The annual report of the Minister of Mines of British Columbia for 1917 has been issued. It is the first to contain reports from the district mining engineers who were stationed in different sections of the Province during the past year. Figures given relating to production proved that the preliminary estimates published months ago were very close to the mark, the estimated production for the twelve months being \$37,182,500, as against a definitely established total of \$37,010,392.

Vancouver Island, B.C.—A considerable amount of ore is on the dump at the Monitor Mine, Alberni Canal, Vancouver Island, waiting shipping. Difficulty is being experienced in obtaining shipping facilities.

A spur is being built by the Sunloch Mining Company from its property to the Vancouver Island Power Company's tramway at Jordan River and arrangements are being made for the shipment of ore to the Tacoma Smelter.

Two shifts, with a total of 40 men, are being worked by the Cork Province Mine on the south fork of Kaslo Creek, B.C. There is a mill in operation.

Action is being taken by the officials of the Dominion National Park to stop mining operations within the park area in that section, which will interfere with plans in hand for the development of the Dunvegan group of claims situated on the divide between the Illecillewaet River and the head of Fish Creek. The operators consider this unfair as the claims were located about twenty-five years ago before the establishment of a park area.

PYRITES.

A recently published report by P. S. Smith, of the U.S. Geological Survey, on pyrites is, in part, as follows:—

The term pyrites is the indefinite general trade name for any of the iron sulphide minerals, such as pyrite, marcasite and pyrrhotite. Pyrite and marcasite when pure have identical chemical composition, namely, about 53 per cent. sulphur and 47 per cent. iron, but differ from each other in mode of crystallization. Pyrite forms cubical crystals, whereas marcasite forms tabular crystals. Pyrrhotite when pure contains about 40 per cent. sulphur and 60 per cent. iron, it is somewhat softer, tarnishes more readily than either pyrite or marcasite, and is magnetic, whereas the other minerals are not.

Pyrites is used mainly for the manufacture of sulphuric acid, and more than 1,250,000 long tons is consumed in the United States each year for this purpose. Pyrites, as commercially used, is generally referred to one of two classes, lump or fines. The lump ore, as its name implies, consists of pieces more than half an inch in diameter, with a certain allowable proportion of smaller particles, and is used in the condition in which it comes from the mine, with little more than a preliminary crushing and sorting, according to size. The fines consist of smaller particles and generally have been obtained by crushing the ore so small that the pyrites can be separated from worthless gangue by some mechanical process. They are also derived from ore that has disintegrated as a result of leaching. Owing to the different methods of treating these two kinds of pyrites for the extraction of their sulphur, they can not be used interchangeably. The lump ore commands somewhat higher prices than the fines, but, of course, it is more difficult to obtain a lump ore with as high a sulphur content as that of fines. As a result, only a few mines or parts of a mine can furnish lump ore and maintain a sufficient sulphur content, whereas suitable fines may be obtained even from deposits in which the pyrites is sparsely disseminated.

No definite lower limit can be placed on the proportion of sulphur that a pyritic ore must contain to be of commercial grade. In practice, however, material containing more than 40 per cent. of sulphur is specified, and practically none of the acid companies use material that carries less than 35 per cent. of sulphur.

Several elements or substances by no means rare in pyritic ores are objectionable as material to be used in the manufacture of sulphuric acid and decrease the value of the ore in which they occur, or they can be used only by means of special treatment.

Certain elements, arsenic and antimony, for instance, are poisonous and have a bad effect on the resulting acid, but some of the large fertilizer plants do not reject an ore containing less than 1 per cent. of arsenic. These elements are also injurious from a manufacturing standpoint, if the pyrites is used in plants making acid by the contact process, as they attack the platinum and cause it to lose its efficiency. According to Wilson, pyrites carrying more than 8 per cent. of copper can not be profitably employed in the manufacture of sulphuric acid. Carbonaceous material, such as the coal adhering to the pyrites or "coal brasses," is apparently heavily penalized by acid manufacturers because it yields acid of a dark color. This effect, however, should not prevent pyrites containing some material of this sort being used in making some low-grade acids for the manufacture of fertilizers and similar materials.

On the other hand, however, most of the pyrites derived from the coal beds is marcasite, which decomposes readily, sometimes ignites through spontaneous combustion, or oxidizes to sulphuric acid, and is, therefore, a dangerous or expensive substance to leave in storage dumps.

The pyrites industry throughout 1917 showed an unsettled condition due largely to uncertainty as to whether importation of Spanish pyrites would be continued. At times the impression would be prevalent that further imports of pyrites would be stopped and there would follow a feverish interest in finding possible sources of domestic ore. Before much progress had been made in this search, however, a contrary rumor would be circulated and activities would decrease or actually stop. These conditions alternated in their hold on the minds of those who might have been willing to undertake the rather expensive and time-consuming operation of developing mines capable of supplying the sulphuric-acid industry with pyrites. Because of this uncertainty, some of the former users of imported pyrites decided to replace it with sulphur and thus reduce the quantity of imported ore required. This substitution required little change in technology in many of the plants and it was adopted by many manufacturers. By the last part of the year, however, it became evident that more domestic pyrites was necessary, and consequently several mines were opened. It takes time, however, to bring a pyrites mine to the producing stage, so that this activity had but little effect on the output of pyrites in 1917, but it will probably have a considerable effect on the output in 1918.

The shortage of pyrites was made evident by the high price that was paid for it and the difficulty of obtaining considerable quantities even at prices three times those paid in 1916. The quotations given for pyrites in the technical press in 1917 range all the way from 20 to 35 cents a unit for the sulphur content. On the assumption that the pyrites carried 45 per cent. sulphur, the latter price would bring a return of \$15.75 a ton for the pyrites. The usual pre-war price of pyrites was less than \$4 a ton, and, according to the statistics published by the U.S. Geological Survey, the average price per ton, even in 1916, was \$4.64.

The total value of the pyrites imported into the United States in 1917, was \$5,981,457, or an average value of \$6.18 a ton; in 1916 the average value was \$5.41 a ton. In this connection, it should be noted that in 1916 the price paid for Canadian ore was considerably lower than that paid for the Spanish ore. The value of Canadian pyrites was stated to be only about

two-thirds that of the Spanish ore. Some of this difference in price is warranted by the generally higher sulphur content of the Spanish ore, but some of the difference is caused by the unwillingness of the pyrites users to modify their old practice and to accept a substitute if Spanish ore is obtainable even at extra cost.

ANTHRACITE ALLOTMENTS FOR WESTERN CANADA.

In a memorandum issued on July 17 by Charles W. Peterson, deputy fuel controller for Canada, it is announced that Winnipeg is to have 65 per cent. of its normal supply of anthracite coal next winter. The remainder of the Province of Manitoba other than the City of Winnipeg and that portion of the Province of Saskatchewan east of approximately the 104th meridian, is to have 50 per cent of last year's consumption. To the cities of Moose Jaw, Regina and Saskatoon, 50 per cent. of last year's consumption is allotted.

PROVINCE OF ONTARIO

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Preliminary returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth \$71,060,942, of which the metallic production was \$56,845,788.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

WHERE THE FORGE LEAVES OFF

No matter how good your blacksmith may be, he is limited by the forge and anvil. Give him an

IMPERIAL WELDING CUTTING EQUIPMENT
OXY-ACETYLENE--OXY-HYDROGEN

and his field of usefulness becomes at once tremendously enlarged.

In a few hours he can weld any broken metal part—no matter how large or complicated the break.

Avoid long shut-downs and delays.

KEEP THE COAL MOVING

An Imperial Welding Equipment is the best assurance of continuous output you can have around the mine, and its cost, by comparison, is insignificant.

Complicated fracture made as good as new. On one important piece of work the whole cost of the Imperial Equipment may be saved.

Write to-day for new catalog containing valuable data on cost of operation, views of work actually done, etc.

means quality

ECONOMY

In the use of EXPLOSIVES is of
SUPREME IMPORTANCE

Under existing conditions Ammonia Dynamites cost considerably less than Nitro-Glycerine Dynamites or Forcite, and are equally satisfactory under many conditions.

Why not try them.

CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO

No. 16

THE B. GREENING WIRE CO., LIMITED
HAMILTON, CANADA

The Canadian Mining Journal, Purman Bldg. 263-265 Adelaide St. West, Toronto, Ont.
Published on the 1st and 15th of each month. "Entered as second-class matter, April 23rd, 1908, at the post office at
Buffalo, N.Y., under the Act of Congress of March 3rd, 1879."

“the Continuous Coal- and Cost-Cutters”

If you are a Coal mine owner or superintendent, about to equip with mining machines, suppose you test each machine offered you by the following questions:

1. Does it cross the face at one operation under its own power?
 2. Will it cut in either direction along the face, as desired?
 3. Is it fitted with A.C. or D.C. or air motor, as desired?
 4. May the motor be made explosion proof?
 5. Has it chain drive?
 6. Is the drive mechanism protected against breakage by friction clutches?
 7. Are all working parts protected by an armor plate housing?
 8. Will it stand up to the hardest kind of cutting I have?
 9. Can I cut to any depth I require, say 10 feet?
 10. Is it the most efficient machine I can select, in cutting speed and in cost of power and repairs?
 11. Do a majority of bituminous operators regard it as the best coal cutter?
- There is but one machine that will enable you to answer yes to all these questions—

It's the Sullivan Ironclad. Why not start right?

Ask for New Ironclad Catalog, No. 673

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

The "Little Giant" in Asbestos

In open work the piston drill has still its place—for deep holes where a whole face is to be blasted off.

The "Little Giant" is the drill for this work, the drill for hard service under all weather conditions.

MINERS PRODUCE!

Produce to Your Utmost Capacity

THIS is the nation's call at the present time. It is one of the vital necessities of the Great War that the entire metal industry increase production to its utmost capacity.

The "New Cleveland" Type S Stopers will increase you output and yet cut down the cost of drill upkeep.

And more than that—they stay on the job more constantly and cost far less for repairs. They use less air and operate more smoothly than other drills. The speed and power of the blow enables the runner to break previous records.

Write for Bulletin No. 35-A which fully describes the "New Cleveland" Type S Stoper.

PROMPT AND ACCURATE RETURNS

IMPERIAL WELDING AND CUTTING EQUIPMENT
OXY ACETYLENE PROCESS

Avoid Shut-Down or Delay When Emergencies Arise

The tool equipment of every mine is incomplete without an Imperial Welding Outfit. Within a few hours after the most serious break, metal parts will be inseparably joined and work continued, as a result of its use. First in Economy, Efficiency and Safety, the initial cost of an Imperial Equipment is often repaid in a single operation.

Write today for catalog, containing valuable data on cost of operation, work actually done, etc.

CRUSHING ROLLS FOR COAL

Breaker Rolls with inserted teeth

The crushing of coal and other soft material is most satisfactorily done by means of rolls with pointed teeth or with corrugations.

We are prepared to furnish coal crushing rolls with inserted steel teeth or those with teeth cast on segments which are bolted to the roll bodies. Of the latter type, those with teeth cast on manganese steel segments are the more satisfactory.

Corrugated Rolls and those of the pointed tooth type are especially adapted to the crushing of rock salt, phosphate rock and similar materials. We are prepared to furnish machinery to meet the various requirements for this class of work.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping. Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - **Halifax, N. S.**
Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

For prospectors and small tonnages

There is no reason why prospectors and operators of small mines cannot get the same percentage of efficiency as the huge plants milling thousands of tons. We offer a ball-mill costing only as much as the bare foundations for stamps of equal capacity and designed like the large MARCY mills.

Number Thirty-Two **MARCY MILL** CRUSHING "ONE EASY STEP"

This mill is suitable for plants of from 10 to 15 tons capacity and can be operated by gas-engine, water-wheel, or electricity, requiring only about 4 H.P. It is self-contained and portable; is fitted with the patented Marcy open-end discharge grate of welded chrome-steel; will grind for amalgamation or concentration, taking crusher feed. Low first cost, low maintenance, high efficiency, *lowest cost per ton output*. Follow the experience of the large mill user on a small scale.

KLIM
IN POWDER FORM

Overcomes Transportation Difficulties

Klim is pasteurized separated milk in its most highly concentrated form—dry powder. Dissolved in water it gives the full food value and has the natural milk flavor unchanged. Klim bulks small, is light in weight, and saves most of your present freight charges and car space on your milk account. If you have to ship long distances Klim is the only milk food that can be absolutely relied upon at the journey's end. It keeps fresh for any length of time without refrigeration. Use Klim mixed dry with other ingredients in baking or cooking, or dissolved in water for use as liquid. Convenient, economical, safe, pure.

IT'S GENUINE—THE FLAVOR PROVES IT.

THE ARBITRARY PRICE OF GOLD.

During recent months there has been much discussion concerning the difficulties being encountered by producers of gold and the advisability of encouraging production. These discussions have brought before the public the fact that increased costs threaten to make gold production unprofitable, and have raised the question whether gold production is essential.

A good deal of the discussion is more entertaining than instructive; but enough has been stated to make it clear that we cannot depend on the so-called economists to solve the problem. They are too much given to generalizing without stating the limits of the application of their arguments. If the gold producers want to get the facts correctly before the public they will have to get together and study the matter thoroughly as one that vitally affects their business.

As pointed out by Mr. B. L. Thane, in a recent letter published in "Mining and Scientific Press," production of gold is now being made at a loss by a large number of companies. This is, unfortunately, not a new experience in the history of mining, but it is one that is making an unusual amount of trouble because the conditions are peculiar. In the mining of other metals there are periods when over-production so breaks the price that operation of the lower grade or smaller properties becomes unprofitable; but such periods are attributable to lack of demand for the product. In the case of gold, there is no lack of demand, but a price fixed by Governments. Unfortunately, the price was fixed before the war and is out of keeping with the cost of production. Unfortunately also, the price cannot be changed so easily as that of other metals. Mr. Thane says:

"The production of gold from the majority of the low-grade deposits is now being made at a loss. Last month, 300,000 oz. of gold produced on the Rand, which is the most productive gold-mining region in the world, was sold to the Government at less than cost, and the same thing is true of several of the largest properties in Alaska, Canada, and the United States. It is inevitable that, unless some form of bonus is given to the producing mines, or an actual increase in the value of the product itself is made by the countries in which gold is now being mined, the large producers will be compelled to discontinue operating and the already decreasing production of gold will be most seriously affected. It is obvious, likewise, that the estimated profits on ore, based on pre-War conditions, on which these enterprises were established, have ceased to exist. Tonnages of developed ore in the mines that were carried as an asset because profit was indicated on the pre-war basis, must be entirely written off under pre-

Development of the oil fields of southern Ontario is meeting with very encouraging results. There will be considerable production from new wells this year and we may reasonably expect that the success of those who have been pioneers in the new campaign, will attract many others. As pointed out by Mr. M. Y. Williams in this Journal last year, southern Ontario offers good opportunities to the driller.

A considerable amount of wildcat drilling must be done before we know what the oil resources of Ontario are. With the assistance of men who have had experience in oil production in Ontario and with advice from geologists who have studied the structural features of the oil fields and of the surrounding country, the driller in Ontario is not without good guides in choosing likely places. It should be recognized by the public, however, as it is recognized by oil men, that many of the wells drilled must necessarily be wildcats, if the territory is to be thoroughly tested. The exploration for oil in Ontario has now been undertaken on a scale and with preliminary successes that warrant one in believing that important new fields will be developed. It is to be hoped that the progress of development will not be seriously hampered by the efforts of those who are more interested in fooling the public than in searching for oil.

sent conditions, and only the richer ore in the operating mines can be carried now in the form of a reserve. In other words, no low-grade gold-mining operation conceived, financed, and developed under pre-war conditions can possibly work out as originally planned, nor can it hope to continue for any length of time unless a bonus is offered by the Government to compensate for the increased operating costs, or unless the value of the gold, as fixed by the Government, is materially increased.

"One of the most important and interesting questions arising in this discussion is the value of gold as now fixed and accepted by the leading nations of the world. The price of pure gold in our standard of money is fixed at \$20.67 per ounce. This value was arbitrarily fixed by the Bank of England when England decided that it was advisable to fix the value of gold in order to standardize exchange. Prior to this, while England had adopted gold as a standard, she had been in the habit of purchasing gold in the open market at a variable range of prices. This necessarily affected, from day to day, and from purchase to purchase, the very basis of exchange. Hence the necessity for establishing a fixed price.

"It is generally conceded that the price as fixed was taken from the last purchase of gold made by the Bank of England in the open market. This, in our money, as stated above, happens to have been \$20.67. Shortly after this, the other leading nations accepted that gold standard, and likewise the price that had been fixed arbitrarily by the Bank of England and sustained with the approval of the British government. The important fact regarding this, so far as the present discussion is concerned, is that the price as fixed was purely arbitrary. Even if measured in the currency of the time at which this occurred, when gold was estimated to be worth \$20.67 per ounce, it is evident that the great increase in the demand for this product and the increased cost in producing it, makes this valuation now incorrect and decidedly too low. Accepting gold as a basis of all credits, there has never been a period in the history of the world when the demand has been so great as now, in order to sustain a reasonable reserve against the Government issues of bonds, certificates, and other forms of obligation."

The "Annalist" says: "All the arguments for action in favor of the gold industry regard it as a burden instead of a convenience that there should be a fixed Mint price for gold. They fail to remark that they are under no compulsion to sell to the Mint, and that they do not sell to the Mint as selling usually is understood. Theoretically they receive their metal back again, in coins of certified weight. They often are paid in checks rather than in bullion, but that does not alter the fact that they get from the Mint all that they give to the Mint, less only an inconsiderable Mint charge. The Mint price has nothing to do with the worth of the gold. That is settled now, as it was originally settled

in England, by the universal market for all commodities. Gold is worth what it will buy, no more, no less. The worth of gold is fixed by the price of commodities as much as the worth of commodities is fixed by the price of gold. The goods buy the gold, and the gold buys the goods. The market is free even in these war times, and all buyers and sellers fix their own prices for whatever they own, whether goods or gold, subject only to the control which affects goods and gold alike, for reasons independent of the price or value of either goods or gold.

"It would make little difference whether the Mint price were doubled or halved. In either case the bargains would be for the weight of gold which passed, and which is certified to all buyers and sellers. The producers of gold get their profit when they spend it, not when they mint it. The alteration of the Mint price would be disturbing generally, without benefit to them. What they want really is an alteration in their favor of the relation of the prices of goods to gold. It is difficult enough to control individual prices. It is practically impossible to control the relation of one price to another. Gold and goods are exchanged around the globe in these days, and the attempt to control the value of gold in international exchange—something quite different from the control of the Mint price—requires control of world conditions."

With such plausible arguments economists convince themselves that gold is always selling for what it is worth. The public looks to them for information and generally they are able to obtain some; but many economists seem ever willing to believe that all things are as they should be. They repeat in various ways their much loved view, that the prices of commodities are directly determined by supply and demand, even though they know that the actions of certain groups of men may easily establish new prices at times when no serious change takes place in supply and demand, or cost of production. They say "if more gold is produced the price of commodities will be higher," when they mean "if more gold is produced and our theories are sound and prices change but do not decrease then prices must increase." There are many things affecting prices of commodities besides the available supply of gold. If the effect of all these things remained stationary over a long period we might find out the relation between gold production and prices; but it is folly to assume that they do and then make deductions simply to prove a theory. Gold is the standard by which we measure prices of commodities, but does it necessarily follow that prices are always what they should be?

While we do not advocate the changing of the price of gold we nevertheless believe that the selling price of gold is not in accordance with the demand and the cost of production. General recognition of this fact is desirable, as such recognition may result in changes that will tend to lower the cost of production.

Mining in Northern Manitoba

By J. A. Campbell, Commissioner of Northern Manitoba

"Northern Manitoba" is now beginning to have a really definite meaning to the people of Canada as a vast territory of immense possibilities, just in the initial stages of its development. What has already taken place in the way of development is merely a minute indication of what may be counted on in the future. This Northern hinterland having an area of 178,000 sq. miles was added to Manitoba in 1912, thus putting that province on an even footing, as to extent, with the other Western provinces, and only the future will show whether this equality holds good in other respects.

This extension of territory means much to Manitoba. Hitherto the most inland, it is now to be reckoned with as one of the Maritime provinces; and the province which has given its name to the best wheat in the world and which heretofore has been looked upon as devoted almost exclusively to the production of that wheat, must henceforth take an important place amongst the mineral producing areas in Canada, particularly in the output of copper and gold.

This country, which is looked upon and spoken of as "Hinterland" is really at the front of the province, for it was by way of Hudson Bay, through this region that the first settlers came to the Red River Valley in 1812. Before many more years have passed the wheat and farm products of the successors of these pioneers will pass out through the gateway by which they came. This means of export (and of import also) is the Hudson Bay Railway, extending from The Pas to Port Nelson and now almost completed.

Among other benefits, the construction of this road is directing the attention of the people to Northern Manitoba. It has become known that this immense area is not a vast stretch of rock, water and muskeg which has been the general opinion regarding it hitherto, but that there exists there natural resources of great richness and variety. While investigation as yet has been only of the most general nature, it has shown the existence of hundreds of thousands of acres of good agricultural land, great stretches of valuable pulp wood, a vast network of lakes and rivers abounding in fish of the finest quality, and an unknown area, hitherto merely scratched, in which there have been made discoveries of mineral wealth of such promise as to put Manitoba in a prominent position as a mineral producer.

Mineral Area.

Until very recently the known mineral area has been practically confined to that lake and river district stretching from Lake Athapapuskow and the Saskatchewan boundary on the west to Wekusko or Herb Lake on the east, a distance of approximately one hundred miles. This, roughly speaking, forms the base of an inverted triangle, the apex of which is The Pas, the westerly side being the Saskatchewan river, and connecting lakes, and the easterly side the Hudson Bay Railway.

Lake Athapapuskow is reached by Ross Navigation Company steamers, which give regular summer service from The Pas to Sturgeon Landing via the Saskatchewan river, Cumberland and Sturgeon Lakes. From Sturgeon Landing to Lake Athapapuskow, a distance of sixteen miles, a road has been constructed by the Manitoba Government which is of very material benefit for the hauling of machinery, supplies and other freight.

There is an alternative canoe route here, via Sturgeon and Goose rivers and Goose Lake, connecting with the terminus of the government road at Lake Athapapuskow, by a three mile portage.

The other end of the district at Herb Lake is still more easily reached. This is by the Hudson Bay railway from The Pas to Mile 82. From there a Government road, locally known as the "Gordon Highway" runs to McKay's Landing at the south end of the lake, a distance of eleven miles. Mining properties already discovered commence at a point about five miles north of this landing, and run to the northern end of the lake.

As might naturally be expected, mineral discoveries in this district were first made at each end of the mineral area, as being most readily accessible, and these also are the points where active development work and mining operations are now being carried on.

The Great Sulphide Property—Flin Flon Lake.

It is less than three years ago, August, 1915, since this great body of ore was located and thus was demonstrated the fact that copper must henceforth be taken into consideration as one of the important mineral resources of the North. Thomas Creighton was the original discoverer. He was one of a group of six prospectors sent out to prospect in that district by certain Toronto capitalists and mining men known as the Hammill-Currie-Fasken syndicate. Ten claims were staked and steps taken immediately to find out the quality and extent of the orebody. By stripping and trenching it was learned that it is approximately 2,000 ft. long. The body is narrowest at the north end and widest at the south end where it enters the lake, being there about 300 ft. wide, a vast deposit of solid sulphide. Sampling and re-sampling indicated that at normal values the ore would realize about \$10 to the ton in gold, copper and silver, the copper content averaging 1¼%.

This discovery attracted wide attention and during the succeeding two years prominent capitalists engaged in mining operations, and mining engineers from New York, Boston, San Francisco, as well as from eastern Canada, visited the property. Various propositions were submitted to the original owners, who held out for a figure and terms which were thought to be somewhat excessive and onerous for a new property. No sale outright has yet been made, although others have become interested in the property and it is now in the control of a syndicate which includes these along with most of the original owners. This syndicate is under the management of John H. Black, of Toronto, well known in connection with various Northern Ontario enterprises.

A few months after the discovery a contract was let for diamond drilling this property. A complete drilling outfit, supplies and equipment were taken in during the winter and camp established on the lake shore. On March 26th, 1916, two drills were started on the work and continued until July 15th, 1916. Further contracts were let subsequently and these drills have been almost constantly employed for a period of nearly two years. \$200,000 has been spent in this and other work of investigation in the same connection.

This big expenditure has been amply justified. Investigation has borne out the original estimate, and the

drilling done has resulted in proving up the stupendous quantity of over 20,000,000 tons of sulphide ore which will yield an average of from \$8 to \$10 per ton, at normal prices.

This proven tonnage has satisfied the owners that development work and actual mining operations should be proceeded with. To do this properly means the erection of a smelter at the mine or at some place convenient thereto, also the construction of a railway from The Pas, a distance of about eighty miles. Whatever it might be possible to do at the present time regarding the smelter, war conditions have now made it out of the question to construct the railway. Reports from reliable sources indicate that it is absolutely impossible to obtain the necessary steel.

To properly work and operate this property along the lines indicated means that an important camp of at least 2,500 people will be established there, and a tremendous impetus given to the northern mining industry generally. The construction and operation of the works required will also result in the development of other properties in the district, which the owners are not now able to handle properly owing to the great cost involved, but which properties can, when transportation facilities are afforded and a smelter located at an available point, be operated to advantage. Here is an immense enterprise, the development of which can be confidently looked forward to immediately on the conclusion of the war.

Mandy Mine—Schist Lake.

In all the history of mining there is probably on record no enterprise more unique than that carried on by the Mandy Mining Company at Schist Lake. The truth of this statement is readily conceded when it becomes known that this company after mining the ore, haul it about forty miles by teams, then ship it 125 miles by boat and barge to The Pas, and from there by rail to a smelter at Trail, B.C., half way across the continent. It is handled in the process six or seven times. Only marvellously rich ore and a large quantity of it could stand such expense.

In October, 1915, after the Flin Flon discovery had become known, Mr. F. C. Jackson, a sub-contractor on the Hudson Bay Railway and Mr. S. S. Reynolds, a prospector of some experience, started out from The Pas to see the North country and do some prospecting. By a lucky chance they discovered on the shore of Schist Lake at a spot where many others had been before, the deposit of copper sulphide, which has since proven to be so valuable. Mr. J. E. Spurr, Vice President of the Tonopah Mining Company, was in the district at the time, inspected the claims staked and was immediately impressed with their possibilities. Before he left, an agreement was entered into by which the Tonopah Mining Company took over the property and agreed to develop and operate it. A subsidiary company called the Mandy Mining Company was immediately formed for this purpose, and the following summer \$40,000 was spent in diamond drilling, trenching and other preliminary work. This revealed a body of over 100,000 tons in one lens. Careful assays of the ore showed it to be composed mainly of copper and zinc, the former averaging about 20% and in addition to this there was found to be gold and silver values of approximately \$5 a ton.

With the price of copper soaring skyward owing to the great demand brought about by the war, it was in order to put this mine in the producing class at the earliest possible moment. This decision was arrived at

in the latter part of December, 1916, and contract was let by Mr. H. C. Carlisle, Superintendent for the Company for the hauling of 3,000 tons or more to the head of navigation at Sturgeon Landing, almost forty miles distant. Commendable enterprise was shown by the contractor, C. B. Morgan, in starting and pushing forward the work and by the spring break-up 3,335 tons had been deposited at the Landing, with the exception of a small amount which had been teamed all the way to The Pas. The ore was simply taken out of an open cut, the only machinery used being a couple of steam drills, and a horse derrick. During the summer of 1917 this ore was shipped to the smelter and the returns, therefrom were 337 oz. gold, 60 oz. silver and 1,113,935 lbs. of copper, the total tonnage therefor, averaging 17% copper.

During the summer months complete new mining equipment which had been taken in during the preceding winter was installed in a large frame building. The main shaft was sunk to 200 ft. level, and two drifts started in the orebody. Drifting was continued throughout last winter, and it is now extended 534 feet. Also the company purchased, or built, and put in operation during the summer a 52 ft. tug on Lake Athapapuskow, and a small stern-wheel steamer on Schist Lake, together with a number of large barges. By this means a quantity of ore was transported part of the distance by water, thus lessening the winter team haul to a very considerable extent.

Last winter a contract was let to the same contractor for taking out a minimum of 7,500 tons, and when the season closed 8,600 tons were in the dump at Sturgeon Landing. This is now being hauled out as rapidly as possible by the Ross Navigation Company steamers and shipped to Trail. A spur track has been put in by the Canadian Northern Railway at The Pas, connecting the main line with the dock, in this way facilitating very materially the work of trans-shipment. Further effort is being made to reduce the labor and expense incident to this work, and to increase the annual output so it is expected that next winter a still greater tonnage will be got out.

As this mine is only a short distance from the Flin Flon property the erection of a smelter there would be of very material benefit, and would result in great increase of output and corresponding lessening of expense.

Lake Athapapuskow District.

Until within a quite recent period the only claim of Lake Athapapuskow to distinction was that it is not only the largest of the many lakes in the district, but with its numerous islands and rocky shores it is looked upon as an exceptionally beautiful body of water. The Chica claims, located up the Pine Root river a short distance are being thoroughly prospected and a diamond drill has been working there for several months. This and others in the neighborhood are giving promise of satisfactory results. On the north shore of the east arm discoveries have recently been made which indicate that there is there a vast body of sulphide ore, running from 2½ per cent. to 3 per cent. copper. From reports received, it is estimated that this property will rival the Flin Flon discovery in extent and quality. A number of other finds have been made in the district, mostly copper. Geological indications point to the fact that there are other mineral deposits of value in the vicinity and further discoveries will doubtless be made from time to time.

Herb Lake Gold Mining District—Rex Mine.

It was in the summer of 1914, at Wekusko, or Herb

Lake as it is now more generally known, that the first important mineral discovery of the north was made. The prospectors who had this distinction were Messrs. Hackett and Woosey and the Kiski and Wekusko were the first claims staked. The discovery was a vein of gold-bearing quartz showing considerable free gold. This find attracted wide attention and soon the whole shore of the lake north of the above claims and for some distance in was all staked.

Among the claims subsequently located were those of the Rex group, staked by Messrs. Campbell, Hassett and Moore. These have since become the best known in the district and now contain a producing mine. The preliminary work of stripping and trenching showed up a vein of such promise that a deal was consummated with Makeever Brothers, mine operators of New York and Boston, whereby they undertook to develop the property, put up a mill and carry on mining work generally. A shaft was the first thing commenced, and it was found that as the depth increased the vein widened. One shaft has been sunk 120 ft. and another to a lesser depth. Considerable drifting has also been done.

As soon as the road from the railway to the lake was completed last summer, a portable saw mill was taken in, set up and put in operation forthwith, to cut lumber for mine buildings. It was fortunate that logs for this purpose were available in the vicinity. A full equipment of mill machinery for reduction work had already been shipped.

Buildings were erected and machinery installed during the winter. The main building is 60 x 55 ft. and shaft house 40 x 20 x 35 ft. Assay office was also put up. The camp buildings which are well built log structures were erected when the work on the claim was first commenced.

Machinery and equipment included a 10 ft. Lane mill with capacity of forty tons per day, together with amalgamation plates and Deister Overstrom concentrating tables. The engine is 55 H.P. and there are two 60 H.P. return tubular boilers and a 390 cubic feet air compressor with modern equipment of air drills. Forty men are now required in connection with operation of the mine and milling plant.

May 1st, 1918, was an eventful day in the history of Northern mining, for it was on that date that the Rex mill started crushing ore and with small interruptions for adjustments and cleaning, has operated continuously since. The first clean-up from 433 tons of ore crushed resulted in a sponge containing 365 oz. gold, 82% fine, having a value of \$6,186.53. Similar results were obtained from the next run of ore. These results are decidedly gratifying. To start up a small mill, and pay its way from the first month at a time when well known mines are shutting down on account of abnormal labor and commodity prices, is quite a feat and should definitely place Herb Lake on the map as a gold camp.

A few months ago when the owners had thoroughly satisfied themselves that they had a producing mine, a company known as the Herb Lake Gold Mines, Limited, was formed. Stock in this company is held mainly by Makeever Brothers, and the original owners of the claims. A few others have secured an interest but no stock has been put on the market in Manitoba.

The Moosehorn.

To the Northern Manitoba Mining and Development Company is due the credit for being the first to make an ore shipment from Herb Lake as a commercial pro-

position. The company is composed of local shareholders, and own the Moosehorn and other claims. Commandable energy was shown in development of the property. An 80 ft. shaft has been sunk and some remarkable returns received from assays. A 50 H.P. boiler, air compressor, drills, hoists, etc., together with regular camp equipment are on the property.

The trial shipment was sent to Trail smelter. This consisted of 57,000 lb. of gold bearing quartz, taken from the shaft in the ordinary way. The returns for the whole car were \$2,323.60 in gold, or \$81.53 per ton. Local capital, however, has not been found sufficient to work this mining property satisfactorily, so an interest therein has been disposed of to Makeever Brothers, who have undertaken to proceed with development work, and mining operations on the proper scale. As this mine is near the Rex the two properties can be worked together advantageously and with best results.

Other Properties.

The Elizabeth-Dauphin claims are another well-known group. Considerable work has been done thereon, including the sinking of a 50 ft. shaft. The Pas Consolidated Mines, Limited, control the property and have undertaken to spend a large amount of money in development work during the current year.

Shafts from 30 to 50 ft in depth have been sunk on several other claims, particularly the Syndicate, Kiski-Wekusko and McCafferty. War conditions have, however, prevented the programmes of the owners of these from being carried out, but they will be gone on with at a later date as the properties give good promise of satisfactory results.

Recent Discoveries.

A recent discovery which is attracting general attention is that made by Paul Gasse and his associates at the northern end of Herb Lake. The discovery was made in the granite which has hitherto been taboo to local prospectors. It has every appearance of being a pegmatite dyke in which there is considerable development of quartz in stringers and irregular masses.

The width of this mineral body is from ten to fifty feet; the length is not yet determined, but appears to be quite extensive. A number of samples have been assayed, and the results are very promising. The discoverers are now doing the usual preliminary work on the property in order to get a general idea of the extent and character. Several mining engineers from United States and Eastern Canada have recently visited it and one of them representing a big Canadian mining company has obtained a sampling option.

Now comes word of a find which opens up a new field. This is at Knee Lake, near Oxford House, on the Hayes River. Several prospectors working for an English syndicate have recently come out from there and recorded a number of claims. The discovery is gold quartz of low grade; but there is every indication from surface examination of there being a very large body of this ore, and that it is of uniform quality.

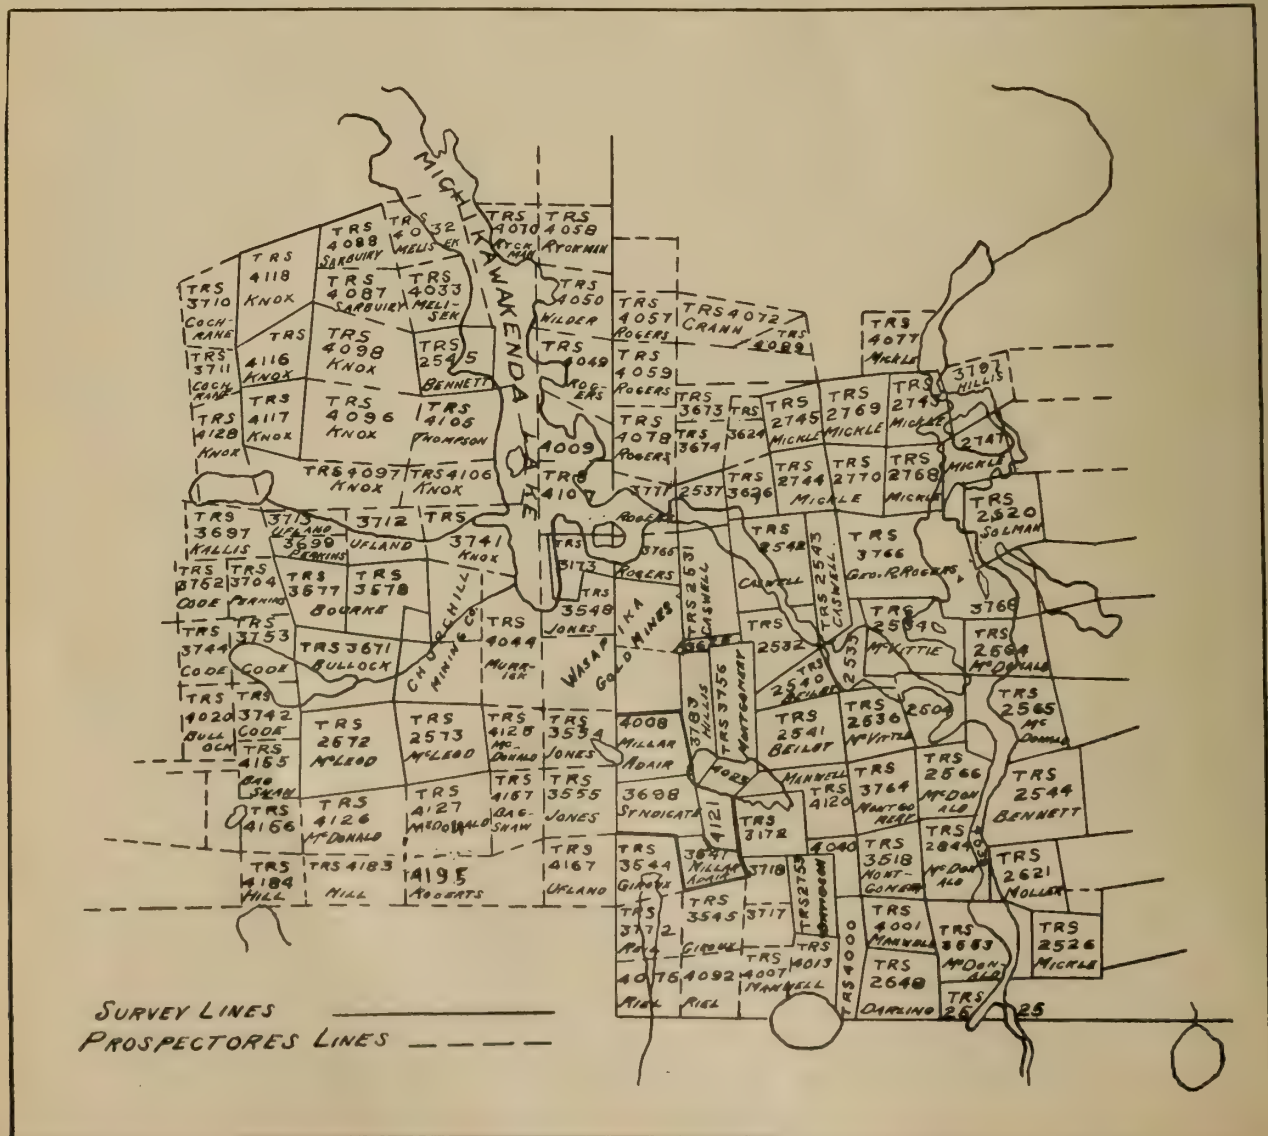

War conditions bear especially heavy on prospecting and mining operations, particularly in a new country. The kind of men engaged in these enterprises are those who are most useful in war work. The same can be said of many of the materials used directly or indirectly in mining development. Owing therefore to dearth of men and material, operations have been very much restricted; but sufficient has been done to show conclusively the existence of valuable mineral deposits which only await the recurrence of normal conditions to bring into being several good camps.

Gold Deposits in MacMurphy and Churchill Tps.

During the past two years a considerable amount of prospecting has been done with encouraging results on some gold properties in the vicinity of Michikawakenda and Wasapika lakes, in the eastern part of Churchill and the western part of MacMurphy townships. Gold was found in this area in 1911 and a large number of claims were staked in that year in Churchill, MacMurphy, Asquith and Fawcett townships. Many of the claims first staked are in the vicinity of Wasaquagama or West Shiningtree lake.

The properties referred to in this article are situated a few miles northeast of West Shiningtree lake and are thus about 70 miles north of Sudbury and 60 miles south of Porcupine. They are easily reached by water routes from the Canadian Northern Railway. Small motor boats which can be carried over the short portages make the trip from Kashbaw or Ruel in about ten hours. The water route is about 45 miles. A winter road has been cut and for part of the distance a summer road is available. Navigation has been made easy by the use of dams and by clearing obstructions from the streams and portages, but considerable work must be done on the roads before they will be satisfactory.

While numerous promising discoveries were made in 1911, comparatively little development work has yet been done in the area and most of what has been done has been disappointing. Gold is very abundant in the area and many small rich deposits have been found. It was obvious from the time the first discoveries were reported that the area merited careful investigation, and it is unfortunate that the results of examination of some of the early discoveries failed to justify the claims of the owners. With very little work done on the properties prices were placed on them that would only have been justified if the deposits had been bonanzas. Operators who might have been persuaded to take a chance, did not find the results of examination such as to warrant large prices being paid for the properties and few who came to investigate stayed to develop. Most of the prospectors themselves did little development work and as a consequence the area remained unproven. It is known that gold is plentiful in the area and it will be surprising if no profitable gold mine is developed, but the area has been for several reasons unpopular. The transportation problem is a serious one. Most of those who have carefully examined and

sampled properties in the area have reported unfavorably. Rich ore occurs on several properties but, so far as is known, only in small quantity and scarcely to be considered in judging the possibility of mining the deposits profitably. Some bodies of fairly good ore have been indicated by surface sampling; but so many seem too small or too low grade that there is a natural tendency to fear that expenditure of money on development work under present transportation conditions would be unjustified. When one mine is in operation and producing gold there will probably be more work done on the neighboring properties, but nobody wants to be the pioneer.

The Ontario Bureau of Mines in 1912 published a report on the West Shiningtree area by Mr. R. B. Stewart. In the following year the Bureau published further notes and a geological sketch map prepared by Mr. Stewart. The Geological Survey, Ottawa, has also published information concerning the geology of the area (Memoir 95) which is included in a large area mapped by Mr. W. H. Collins. In view of the numerous gold discoveries it is to be hoped that this preliminary geological work will soon be followed by a more detailed map and report on the area. The geology of the vicinity of the gold deposits examined by the writer needs careful study if the area is to be prospected intelligently. The wall rocks are of many kinds, including several varieties of greenstones and felsites, ferrodolomite, conglomerate, greywacke, and porphyries. Diabase dykes are common. The gold deposits vary considerably in character as well as in size and their composition and structure as well as their gold content need study. The rock relationships have yet to be worked out in sufficient detail and their structure is probably not understood by the prospectors. The relationship of the deposits to minor and major fractures and to the smaller intrusive masses of rock are of first importance and a detailed geological map would help one to determine them.

W. H. Collins' Report on Geology.

While detailed maps are lacking, a very good idea of the general geology of the area can be obtained from the reports of Mr. Stewart and Mr. Collins. Mr. Collins' report is the more recent and is accompanied by geologically colored maps; Map 179A of the Onaping area, published in 1917; and Map 153A of Asquith and Churchill townships, published in 1916. Mr. Collins says in part:

"Three main geological divisions are represented: the pre-Huronian schist-complex, the batholithic granite-gneisses intrusive in these schists, and dykes and remnants of sills of quartz diabase similar in character, and presumably in age, to the post-Cobalt diabases found throughout Onaping map-area. The gold-bearing veins are found only in the schist-complex, which is, therefore, of chief interest. The schist-complex consists of an extraordinary variety of igneous, mainly volcanic, rocks. The lavas range from basalt to rhyolite and with these are associated volcanic tuffs and one sedimentary series derived from pyroclastic materials.

"The older part of the complex, which was not differentiated into its component formations, includes diabases, amphibolite, quartz porphyry, etc. The oldest rocks differentiated from it consist of flows and tuffs of hornblende andesite and trachyte not separable one from the other. These tuffs grade upward into a well stratified series several hundred feet thick, consisting, in ascending order, of conglomerate, an arkose-like

Gold Quartz vein on McVittie property (the Saville vein).

member, and finely bedded greywacke which locally becomes a lean iron formation. This series is composed of the same materials as the underlying tuffs and appears to be only a water-assorted phase of them. The sediments are cut by dykes of a pale-grey rock of intermediate composition, characterized by its bright red color when decomposed. A large flow of ellipsoidal andesite around West Shiningtree lake appears to be younger than the red-weathering rock and still younger are small bodies of nearly white rhyolite. All these rocks are traversed by wide dyke-like bodies of a coarse porphyritic granodiorite which may represent apophyses from the granite-gneiss batholith. These rocks have been greatly disturbed; nevertheless schistification has been confined mainly to the tuffs and sediments and to local zones in the non-clastic formations. Most of the intrusives and flows are remarkably well

Gold Quartz on Foisey claim.

preserved and massive. Besides the metamorphism due to deformation, all the schist-complex in a zone about half a mile wide next to the granite-gneiss batholith has been contact metamorphosed chiefly to chloritic schist and amphibolite.

"The overburden of sand and gravel is, fortunately for prospecting, not thick nor continuous. Rock outcrops are abundant and none of the exploration trenches seen were more than 10 feet deep. Recent forest fires have also overrun a large part of the district, facilitating its exploration.

be a purely fortuitous circumstance. The genesis of the West Shiningtree veins remains, therefore, an open question.

"There are two somewhat different types of deposit. In most cases the gold is found in distinct veins from a few inches to 6 feet wide, the widths varying greatly from place to place. Some have apparent widths at the surface of 20 feet or even more, but this is due, in a number of cases at least, to the veins being folded, so that the surface exposed is oblique instead of a normal cross-section of the vein. Ordinarily they are nearly

Scenes on the water route from Kashbaw to Michikawakenda lake.

Ore Deposits

"The gold-bearing quartz veins intersect all the rocks of the schist-complex with the possible exception of the granodiorite dykes. Their relation to these dykes has not been observed. They are cut, however, by dykes of the post-Cobalt diabase. It has not been possible to fix the age of the vein formation within narrower limits. The veins have been found in greatest abundance in the ellipsoidal andesite. It is also noteworthy that the interspaces between the ellipsoids are filled with quartz, calcite, and epidote, a sample of which, collected by the writer and assayed by Mr. H. Leverin of the Mines Branch, was found to carry a small amount of gold. The abundance of veins in the ellipsoidal andesite and the presence of gold in the interellipsoidal filling suggest some relationship with the andesite flow. It is not to be overlooked, however, that the interellipsoidal spaces may have been filled by agencies quite unconnected with the andesite flow, and that the abundance of veins in that formation may

vertical. A number of veins had been traced for a distance of 200 feet when the district was last visited by the writer, so it is probable that they attain considerably greater lengths. They are filled with white quartz. Occasionally the quartz is accompanied by patches of white carbonate, which weathers to a rusty, limonitic powder. Minute aggregates of tourmaline were found locally in the quartz. Pyrite in scattered grains occurs both in the vein matter and in the wall rock. Gold occurs as small flakes and irregular particles in the quartz and also in small cavities in the quartz which are filled with limonitic powder, probably the weathering product of pyrite.

"In fewer cases mineralization has occurred in a shear zone in the schist-complex. The schist is filled with small veins and stringers of quartz and both schist and quartz are sprinkled with pyrite. These mineralized shear zones have no definite boundaries separating them from the less sheared, unmineralized country

rock. They are larger than the quartz veins but their gold content is too low for profitable mining."

At the south end of Michikawakenda lake are two promising gold deposits which have been discovered and stripped since Mr. Collins examined this area. The larger of these, the Ribble vein, on the property of the Wasapika Gold Mines, is in altered igneous rocks—mostly a grey volcanic rock that is altered in places to

deposit and its gold content. It will be noted that the structure is by no means simple and that the deposit is a difficult one to sample. The large number of samples taken indicates a good average value and a considerable quantity of ore; but development work is necessary to determine more definitely the shape and size of the ore body. The information at present available is encouraging enough to warrant considerable expendi-

Wasapika mine, from the south.

a ferrodolomite. The other deposit, the Kingsley, on the Knox claims, is enclosed partly by conglomerate and greywacke and partly by grey but red-weathering fine-grained, porphyritic, igneous rock which may conveniently be called a porphyry. Those familiar with gold deposits in Northern Ontario will find the altered wall rock from the shaft at the Wasapika mine to be quite similar to the grey ferrodolomite at the Hollinger mine at Porcupine, while the wall rocks at the Knox property are somewhat similar to those at the Tough-Oakes mine, Kirkland Lake. We would not like to have our readers infer that the value of the properties is necessarily great because of these similarities; but there are some advantages in finding yourself among old friends. We would consider that so far as their composition effects them the wall rocks are kindly disposed. They have been much altered and saturated with carbonates and then the fissures have been filled with auriferous quartz.

The Ribble Vein.

One of the most promising deposits in the area is the Ribble vein on the property of Wasapika Gold Mines, Ltd., held under lease from the Province of Ontario. Mr. George R. Rogers, president and manager of the Wasapika Company, has carefully stripped and sampled this deposit and has begun the sinking of a shaft to develop it at depth. The accompanying photographs and copy of the assay plan will give some idea of this

ture on development work. The irregularity of the deposit as exhibited in the surface outcrops suggests that considerable skill will be necessary in order to avoid mining too much waste with the ore. On the other hand, the persistency of the auriferous quartz outcroppings along the strike on both this and adjoining properties indicates great possibilities in the event that it is proven possible to mine a part of the deposit profitably. The obliquely truncated folds exposed on the side of the hill give an exaggerated idea of the size of individual quartz bodies; but the deposit is nevertheless of considerable size. The shaft has been located in a position which should prove advantageous in exploring the deposit at depth.

In his report on the property, Mr. Rogers states that the vein, as uncovered on the Wasapika properties for 1,800 feet, averages 5 ft. 1 in. So far the vein has only been sampled for a distance of 500 ft. Concerning the results of this sampling Mr. Rogers says: "I have divided this work into two sections:

"**No. 1 Section**—Starting at a point 229 feet north of the south boundary line of claim No. T.R.S. 2530, eighteen carefully moiled samples were taken at intervals across the full width of the vein for a length of 150 feet, which gave an average stoping width of 50 inches and the assay results gave an average value of \$10.40 per ton in gold. **No. 2 Section**—Starting at a point 120 feet north of sample No. 32 and continuing

north along the vein for a distance of 280 feet, over which distance 58 carefully moiled samples were taken across the full width of the vein, which show an average stopping width of 49 inches and an average assay value of \$8.00. A sketch plan of the vein and assay chart attached to this report.

"The main shaft, which is being sunk 80 feet west of the vein, has reached a depth of 50 feet. Samples taken across the bottom of the shaft gave an average of \$11.20 per ton over a width of seven feet. . . . For a distance of 500 feet the schist forming the hanging wall of the vein has been eroded away for an average depth of 20 feet. The average width of the vein over this distance is 5 feet. Estimating the weight of this ore at 13 cubic feet to one ton will give approximately 3,846 tons of ore in sight, with an average assay value of \$9.00 per ton, and practically ready for the mill."

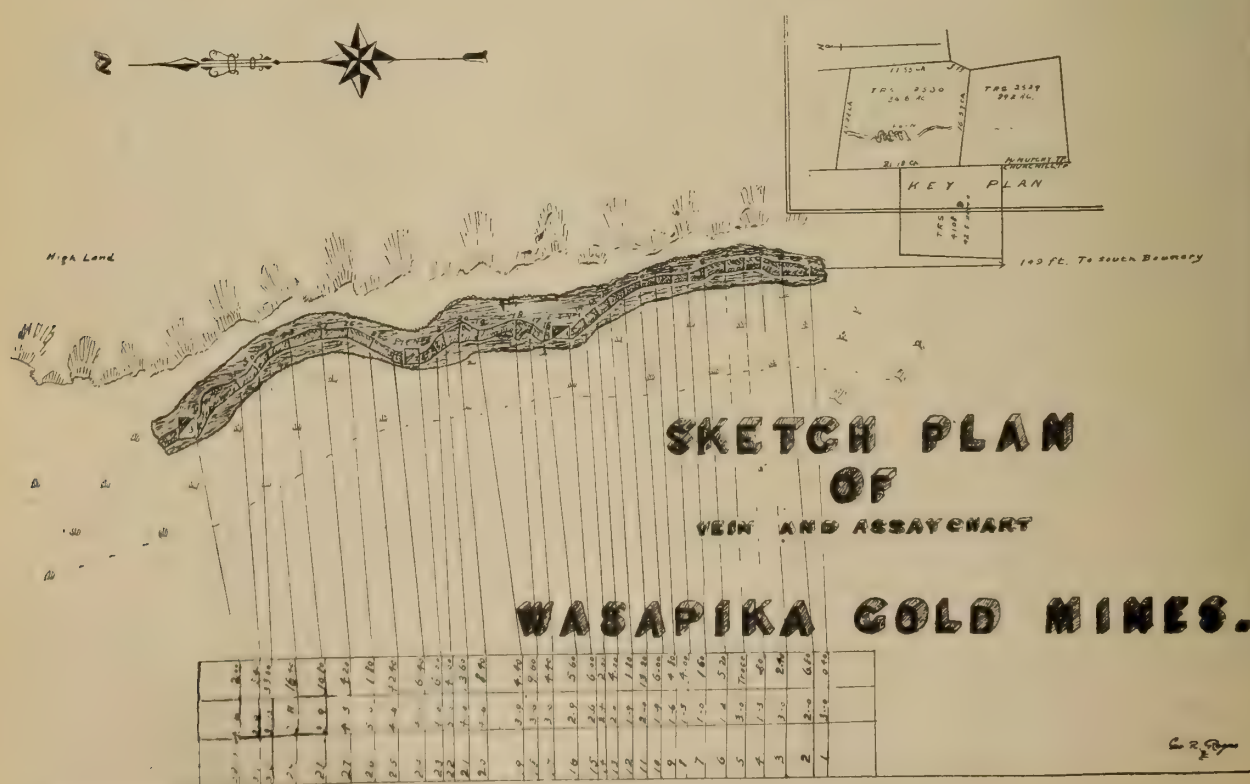

Mr. Rogers notes that where the vein is in contact with diabase dykes, which cross the vein diagonally, high assays are obtained.

The Kingsley Vein.

As shown on the accompanying map the Knox claims lie to the west of the south end of Michikawakenda lake, a short distance north-west of the Wasapika property. On one of these claims is the Kingsley vein, a persistent, narrow, comparatively regular, quartz vein enclosed partly in sedimentary rocks—greywacke and conglomerate—and partly in igneous rocks—a grey and red fine grained porphyritic rock. A shaft has been started on a part of the vein that sampling has indicated to be very good ore. The results so far have been very encouraging, and further development here may reasonably be expected to show a quantity of ore that will make operations profitable.

Other Properties.

At the south end of Lake Wasapika are the Atlas and McVittie properties, known to many as the Jefferson and Saville claims. On the Atlas are two types of gold deposit. That appearing on the hill top which com-

Plan and assay chart of Ribble vein—by Geo. R. Rogers.

mands Wasapika lake is a white quartz vein enclosed in massive greenstones. The accompanying photograph shows this vein and stringers from it. Another deposit, from which some very rich ore was taken is a narrow very pyritic band in rusty grey schist. The rich ore is said to have been taken from quartz nests found in pits sunk in this pyritic band. The quartz, which shows in the pits along the deposit is very dark and rusty and is not nearly so conspicuous as the weathered pyritic rock.

To the west of the Atlas is the McVittie property. An open cut has exposed an imposing vertical face of quartz on the Saville vein. The accompanying photograph shows this exposure.

Gold Quartz vein on Atlas property (the Jefferson claim).

On the shore of the narrow south-east arm of Michikawakenda lake are the workings on the Caswell property, now known as the Gold Banner. Rich samples of ore from this property attracted considerable attention a few years ago and considerable development work has been done. We were, however, not allowed to look at the vein when we visited the property. The accompanying photograph shows the workings on the north shore as they appear from the lake.

South of the Wasapika property on the Miller-Adair and Foisey claims quartz veins have been uncovered at the edge of outcrops which appear on the eastern edge of the low-lying land which runs south from Michikawakenda lake. These veins run along the edge of the rock outcrops in about the same direction as the Ribble vein. Gold can be seen in the quartz on the Foisey claim. No work has recently been done at either of these properties.

A view of Caswell property from the lake.

WILL SAMPLE PEAT BOGS.

Cobalt, Aug. 11.—With the intention of prospecting in the bogs of New Ontario, giving special attention to those in the vicinity of Cochrane, A. Anrep, a Dominion Government specialist on peat, arrived in town yesterday en route to the north. While here Mr. Anrep conferred with A. A. Cole, a member of the peat commission regarding the prosecution of the work. He expects to be in this district for two or three weeks and intended taking a number of men north with him to carry out his scheme of operations. There is no possibility of any official action being taken this year to utilize the peat for fuel, but sampling will be carried out until the winter frosts put a stop to outdoor work, after which testing will be done.

A NEW DIAMOND DRILLING COMPANY.

The Sudbury Diamond Drilling Company, Ltd., has been organized under a Dominion charter, with head office at Sudbury, Ontario. The leading spirit in the organization is Mr. S. J. Fitzgerald, with whom are associated several others, principally local men who are prominent in the mining and commercial life of the section. Mr. Fitzgerald, who is President and General Manager, is a man of wide experience in diamond drilling, having successfully carried on operations not only in Ontario, but also in the United States and Western Canada as well. For the past several years he has been connected with the drilling companies operating in Ontario, and is thoroughly familiar with a great variety of rock formations.

MINERALS SEPARATION.

The Minerals Separation Co. has filed with the Supreme Court petition for a writ of certiorari in the Butte & Superior litigation. If granted, Federal Court decrees in Montana will be reviewed by the highest court in the United States.

The petition states that two errors in the interpretation of the Supreme Court decision in the Hyde case are involved. These are: (1) Imputed limitation of patent to the use of half of 1% of oil or oily substance. (2) Imputed extension of patent to any oil or oily substance having preferential affinity for metalliferous matter over gangue whether capable of effectuating the process or not.

PROFESSOR LEDOUX DIED IN BATH TUB.

Sudbury, Aug. 8.—Particulars obtained to-day regarding the death of Professor Gaston Auguste Ledoux, the Belgian soldier-mineralogist, show that he lost his life in his bath tub. When the body was found the head was submerged, and it is thought that the Professor was stricken with heart failure during his cold plunge. He lost his home in Belgium when the Germans devastated the country, and afterwards he was grievously wounded fighting them. The body will be sent to Toronto, where Madame Ledoux resides.

NIPISSING.

In his regular monthly report to the President and directors, Mr. H. Park, manager, says that during July the company mined ore of an estimated value of \$333,947 and shipped bullion and residue of an estimated net value of \$877,231.

Underground operations continued to be of the usual nature and extent. Several new small veins of low assay were encountered at 73 shaft.

ALIEN PROPERTY CUSTODIAN TAKES OVER THE CONTROL OF TWO LARGE GERMAN-OWNED METAL CORPORATIONS.

Washington, July 24.—The Alien Property Custodian authorizes the following:

A. Mitchell Palmer, Alien Property Custodian, announced Monday that he had taken over the business of L. Vogelstein & Co. (Inc.), 42 Broadway, New York, and of Beer, Sondheimer & Co. (Inc.), 61 Broadway, New York, both of which were large German-owned metal concerns. In taking over these, and other metal businesses, the Alien Property Custodian has smashed for all time the German control of the metal industry in this country. The assets of L. Vogelstein & Co. are upward of \$9,000,000, and those of Beer, Sondheimer & Co. (Inc.) are upward of \$5,000,000.

Result of Investigation.

The two companies were taken over by Mr. Palmer as the result of investigations conducted by Francis P. Garvan, director of the Bureau of Investigation of the Alien Property Custodian's office. Further investigation into the metal situation is being made by him.

Beer, Sondheimer & Co. (Inc.) and L. Vogelstein & Co. (Inc.) were closely affiliated with the German Metal Gessellschaft, which for some years has dominated the entire metal market of the world. They dominated the metal market of this country in such a manner that they were enabled to sell copper, aluminum, zinc and other metals in Germany at a price much lower than the American consumer had to pay.

The enemy interest in Stallforth & Co., of New York, dealers in silver bullion, with a capitalization of \$1,000,000, has also been taken over by the Alien Property Custodian. This concern was another link in the chain of the German control of the metal markets of this country. F. Stallforth, the principal stockholder in this company, is now interned at Fort Oglethorpe, Ga.

Some of the Company Holdings.

With the American Metals Co., the large enemy interest in which has already been taken over by the Alien Property Custodian, Beer, Sondheimer & Co. and L. Vogelstein & Co. controlled most of the principal metal and smelting companies of this country, either by complete ownership of stock or by the ownership of enough stock to give them substantial representation on boards of directors.

Beer, Sondheimer & Co. own a one-half interest in the National Zinc Co., the entire stock of the Cuban Copper Co., the Cuba Copper Leasing Co., and the Norfolk Smelting Co., and 30,000 shares of the Minerals Separation American Syndicate (Ltd.).

Vogelstein & Co. have large holdings in the United States Metal Refining Co. and the American Zinc, Lead and Smelting Co. This latter concern controls the Wisconsin Zinc Co., American Zinc Co. of Tennessee, the American Zinc Ore Separating Co., the American Pipe Line Co., and the Oblesby Gas Co. Of the 70,000 shares of capital stock of the American Metals Co., 15,180 shares are owned by the Metallbank and M. C. of Frankfurt A/M, and 18,180 shares by the Metallgesellschaft of the same place.

The American Metals Co. completely owns the following companies: American Zinc & Chemical Co., Langeloth Coal Co., Langeloth Mercantile Co., Langeloth Townsite Co., American Metal Transport Co., Bartlesville Zinc Co., and South American Metal Co.

It had large holdings of stock in the following companies: Ohio & Colorado Smelting & Refining Co.;

Compania Minera de Penoles, South America; Compania de Minerales y Metales, South America; Compania Metalurgica de Torreon, South America; Compania Minera Paloma y Cabrillas, South America; Compania de Combustibles Agujita, South America; Fundicion de Guayacan, South America; Balback Smelting & Refining Co.; and Nichols Copper Co.

Firm's Part in the War.

From the evidence which Mr. Garvan unearthed it is apparent that L. Vogelstein and Beer, Sondheimer & Co. played an important part in Germany's declaration of war, and of the continuation of the war after Germany had gotten into it. Through their domination of the metal industry in this country these concerns were enabled to send vast supplies of copper and other necessary metals to Germany.

The activities of these German concerns in supplying necessary metals to Germany seems to have continued even after the beginning of the war in August, 1914, and only came to an end when the United States joined in the European struggle.

In 1914 the profits of Beer, Sondheimer & Co., were \$116,624; in 1915 the profits of this concern jumped to \$1,013,676; and in 1916 they reached the large total of \$2,000,000. In 1917, after the United States got into the war, the profits of this company dropped to \$196,900.

The profits of L. Vogelstein & Co. since April, 1916, were extremely large, the firm's business for the last three years approximating \$70,000,000. Between April and December of 1916 the profits of Vogelstein & Co. amounted to upward of \$2,500,000.

New Directors Appointed.

To make these concerns 100 per cent. American the Alien Property Custodian has appointed as directors Americans who are well known in the business and financial life of the country.

The directors named for Vogelstein & Co. are Edward M. McIlvain, former president of the Bethlehem Steel Co.; Louis A. Watres, president of the Scranton Trust Co. and former lieutenant governor of Pennsylvania; James N. Wallace, president of the Central Trust Co. of New York; Alfred H. Smith, president of the New York board of aldermen; C. C. Daniels, of New York City.

The Alien Property Custodian will allow Paul L. Vogelstein and Ernest Hethern to act as directors also. Isidor J. Kresel, 37 Wall Street, New York City, will act as counsel for this company.

Messrs. Wallace, McIlvain, and Watres will also act as directors of Beer, Sondheimer & Co., in addition to John P. Greer, 15 Broad Street, New York City, and Ford Huntington, 15 Dey Street, New York City. Benno Elkan and Otto Frohnknecht will act with the above directors.

Joseph F. Davies, former chairman of the Federal Trade Commission, and Isidor J. Kresel will act as counsel for this company.

Represent Enemy Interests.

The directors whom the Alien Property Custodian has selected to represent the enemy interest in the American Metals Co. are Henry Morgenthau, former ambassador to Turkey; Andrew W. Mellon, of Pittsburgh; George McAneny, assistant publisher of the New York Times; Lewis L. Clarke, of the American Exchange National Bank of New York; E. C. Converse, of the Bankers Trust Co. of New York. John J. Fitzgerald will act as counsel.

Mr. Wallace, with Francis P. Garvan, has been chosen by the Alien Property Custodian to act as directors for Stallforth & Co.

L. Vogelstein & Co. and Beer, Sondheimer & Co. filed reports with the Alien Property Custodian as required by the trading-with-the-enemy act, in which they claimed that they were American-owned New York corporations. Mr. Palmer referred these reports to his bureau of investigation, and after several months of investigation Mr. Garvan, the director of this bureau, found that an endeavor had been made to cover up the German ownership of the assets and that, in spite of the process of Americanizing them, undertaken after the outbreak of the war, their ownership was thinly disguised. **Establishment in New York.**

Prior to the war, Beer, Sondheimer & Co., of Frankfurt am Main, German dealers in metals, especially copper, established an American branch in New York (about 1904), which was managed by Benno Elkan and Otto Frohnknecht. They had written agreements with the home office whereby each was to receive a salary varying in amount, and each was to participate in the profits of the American business.

The American branch had control of the firm's business in the United States, Canada, Mexico, South America, and Central America. In 1912 Elkan and Frohnknecht made an agreement with the home office in Germany whereby each would receive a salary of \$900 per month and in addition 12½ per cent. of the net profits of the American branch, the German firm guaranteeing to each that the salary and participation in the profits should equal not less than \$18,700 per year. The German office provided all of the capital that was required in the business. At the time these agreements were made Elkan and Frohnknecht were German citizens. Although they had been in this country for a number of years, they never took out naturalization papers until early in 1917.

In August, 1915, the New York corporation was organized with the corporate name of Beer, Sondheimer & Co. (Inc.). The reason for the organization of this new corporation is perhaps best stated by Elkan and Frohnknecht in their report to the Alien Property Custodian, in which they say:

"On the outbreak of the European war it became increasingly difficult, and finally impossible, to communicate with the same partnership (the German partnership), and it has therefore been impossible to have a final statement of their accounts, as such managers of said American branch, with said partnership. In August, 1915, the New York corporation was organized with the corporate name of Beer, Sondheimer & Co. (Inc.), under the direction of Sullivan and Cromwell, as counsel."

Wireless Message Quoted.

That the home office was familiar with the plans for the organization of the American company, and that the latter was organized upon the advice of the German concerns is shown by the following wireless dispatch, dated August 28, 1915:

"Beer, Sondheimer Co.,

"Frankfort, Main:

"Have completed the corporation as planned under name Beer, Sondheimer & Co.; incorporated capital, \$1,000,000. "Elkan Frohnknecht."

The capital stock of the new American corporation consisted of 10,000 shares of the par value of \$1,000,000 and were all issued to the German copartnership, thus

recognizing that the assets of the American branch at that time belonged to the German firm.

It is regarded as significant that the capitalization of the new company was only \$1,000,000, whereas the books show that on June 30, 1915, the assets exceeded the liabilities by \$3,200,000, so that the book value of each share of stock was more than \$300. Five shares of stock in the new company were issued to qualify directors and the balance of 9,995 shares were put into a voting trust, the voting trustees being Elkan and Frohnknecht, one Falck, bookkeeper of the concern, and a lawyer named Nelson.

Elkan became president of the new corporation and Frohnknecht the vice-president. The new corporation voted them exactly the same salary and the same percentage in the net profits of the business as was provided for them in 1912 agreement with the German firm.

Purchase of German Stock.

In the spring of 1916, when the war clouds began to look threatening in this country, Elkan and Frohnknecht engaged one E. O. Jacobson to go to Europe for the alleged purpose of purchasing from the German partnership 3,000 shares of the stock owned by the German partnership in the American corporation. They claimed that Jacobson bought this stock at \$80 a share and that they paid \$240,000 for it, paying \$151,000 in cash and transferring to the German firm \$50,000, which they had on deposit with it, and \$39,000 likewise on deposit on a subscription to the German war loan. Jacobson is said to be dead. The only receipt submitted by Elkan and Frohnknecht is for \$89,000.

It was claimed that Jacobson while abroad obtained from the German firm a power of attorney, pursuant to which he sold to the American corporation the 6,995 shares of stock left in the ownership of the German firm after the pretended sale of the 3,000 shares to Elkan and Frohnknecht. In other words, Jacobson was at the same time attorney in fact for Elkan and Frohnknecht, and for the German firm, and dealt with himself in both capacities. Acting under power of attorney for the German firm Jacobson sold to the American corporation, who apparently were only Elkan and Frohnknecht, the remaining 6,995 shares of stock.

Price Statements Contradictory.

Contradictory statements were made as to the price at which this sale was made. In the report to the Alien Property Custodian by Elkan and Frohnknecht, in which they undertake to give the history of this pretended sale, it is stated that the American corporation in January, 1917, purchased this stock out of its accumulated surplus, paying therefor the sum of \$700,000 in cash. It is also stated in the report that in addition to the \$700,000 approximately \$2,410,000 was paid by the American corporation to the German firm as "the balance of the original investment," the claim being that the German firm was willing to sell out its interest here for the amount of the original investment. Later Elkan and Frohnknecht claimed that the \$700,000 was not the amount of the purchase price, but that the purchase price was \$700,000 plus the balance of the original investment so paid back.

In the course of his investigation Mr. Garvan discovered that in July, 1916, Elkan and Frohnknecht each drew \$75,500 from the American corporation, thus making up \$151,000, which, added to the \$89,000 on deposit in Germany, enabled them to pay \$240,000 as the alleged purchase price for the 3,000 shares of stock.

Convinced Sale Was "Camouflaged."

Mr. Garvan became convinced that the sale of the German-owned stock in the American concern was camouflaged. It appeared that all of the money, with the possible exception of \$89,000 held by Elkan and Frohnknecht, came from the treasury of the American corporation, which in turn was owned by the German partnership. It appeared also that for the sum of \$240,000 Elkan and Frohnknecht purchased a property that during the year in which they purchased it yielded a profit of \$2,000,000.

In fact there was considerable doubt as to whether more than \$89,000 of this purchase price was actually paid. In January, 1917, when the purchase was supposed to have been made, the American corporation had net assets over all liabilities amounting to \$4,866,000, and the profits of the corporation in 1916 were \$2,000,000. Thus it would seem that the German partnership took about \$3,000,000 of \$4,866,000, made a present of \$1,866,000 to Elkan and Frohnknecht, in addition to giving them the business which in one year made a net profit of \$2,000,000.

That the Germans knew that the sale was only a pretended and pro forma transaction is shown by a wireless which they sent to one Harry Falck, an employee of the American branch, acknowledging the receipt of part of the \$240,000. In that wireless they referred to the shares as "pro forma Jacobson shares." The following is the wireless:

"Berlin, November 26, 1916, 9.25 p.m.

"Harry Falck,

"61 Broadway, New York.

"Friday, 24th. Don't sell now steels. below 110. Understood your remittance kronen 340,000 Knauth Nachod 290,000 mark against proforma Jacobson shares, but will not arrange for balance shares same kind. Wire whether arrangement White made as per our letter 7544. How is phosphate position and domestic market Could you sell part stock domestic?"

"Beer, Sondheimer."

Among other steps to hide the alien character of the assets of this concern was a purported consolidation of the New York corporation with another corporation called Pendennis Metals Corporation.

The Pendennis corporation was a mere shell, which was organized for the very purpose of consolidating it with Beer, Sondheimer & Co. It had no assets; only \$1,000 worth of stock was ever issued, and the stockholders were clerks in the office of the lawyer under whose supervision the consolidation was effected.

Vogelstein Naturalized Citizen.

Ludwig Vogelstein is the head of L. Vogelstein & Co. He is a naturalized American citizen. For many years he has represented in this country the firm of Aaron, Hirsch & Sohn, of Halberstadt, Germany. He had charge of their business in the United States, Canada, and Mexico. The concern did a very large business, the average for the past three years being about \$70,000,000 a year. He had an arrangement with the German firm whereby he received a share in the profits made upon the firm's business in America. His interest in the profits was about 15 per cent. and he also had an interest in the profits of this firm's business in Germany. These profits were determined annually from accounts rendered at the end of each year. Vogelstein claims that since 1915 he has been unable to get an accounting from the German firm.

Up to December, 1916, the American branch was conducted as a partnership and Aaron Hirsch was one of

the partners. In December, 1916, Vogelstein formed a New York corporation, capitalized at \$5,000,000. All the property of the partnership was transferred to the corporation, including, according to Vogelstein, the accumulated profits belonging to the German firm, which, in April, 1916, amounted to upward of \$1,600,000.

Vogelstein claimed that in April, 1916, his agreements with the German firm were terminated, but the Alien Property Custodian declined to accept that statement and contended that the interest of Aaron Hirsch & Sohn in the American business has continued to date and that except for Mr. Vogelstein's participation in the profits, all of the assets of the American concern belong to the German firm.

Large Quantities of Copper Stored.

Mr. Garvan in his investigation discovered that Vogelstein & Co. had stored large quantities of copper for delivery after the war to Aaron Hirsch & Sohn. He also found that the latter concern had guaranteed notes for several hundred thousand dollars given to a New York bank by L. Vogelstein & Co.

When Vogelstein formed the corporation he recognized that Aaron Hirsch & Sohn owned at least some of the stock, and the entire \$5,000,000 of capital stock was placed in the possession of Vogelstein's attorneys to await an accounting with the German firm at the end of the war. Mr. Palmer has taken possession of the entire \$5,000,000 of stock and has taken control of the business.

MONTANA COPPER SMELTERS AGAIN PRODUCING 1,000,000 LB. PER DAY.

Reports of the production of copper in Montana in 1918, according to V. C. Heikes, United States Geological Survey, Department of the Interior, indicate that the State will this year make an output equal to that of 1916, which was more than 352,000,000 pounds. The output in 1917 was about 278,000,000 pounds. The large copper mines at Butte gradually regained their normal output in 1918, reaching it in February, and the smelters in Montana were said to be producing copper in May at the rate of more than 30,000,000 pounds a month. Early in 1918 the Anaconda Co. was producing copper at the rate of nearly 27,000,000 pounds a month, and the East Butte Co. at the rate of 2,300,000 pounds a month. Though many mines resumed operations in 1918, the High Ore mine, which has been producing 1,900 tons of ore daily, was closed in June to permit the shaft to be concreted. The North Butte and the Davis Daly mines are making improvements in equipment and are increasing their shipments.

MANGANESE AT COWICHAN LAKE, B.C.

Manganese has been discovered in the vicinity of Cowichan Lake, Vancouver Island, and, according to report, there is a considerable deposit of the ore. The locator is a Mr. Douglas, the staker of the Blue Grouse Copper Claims, Cowichan Lake. Nothing definite is yet known of the new property, but those interested are enthusiastic and a mining engineer will make an inspection immediately.

CHROMITE FROM CASCADE, B.C.

The chromite claims of Cascade, B.C., are being operated by the Stewart-Calvert Co., which recently acquired them. Small shipments, totalling 150 tons, have gone forward to Niagara, Ont., and Pittsburg. Another 100 tons is ready for shipment.

ONTARIO GOLD AND SILVER MINES AND GOLD AND SILVER MINING STOCK MARKETS.

The Ontario Bureau of Mines recently issued the following figures relative to the production of gold and silver from the Northern Ontario Camps:

Government returns show a gold and silver production for 1917 of \$25,000,000 in value.

The total gold production to date is valued at about \$37,000,000 and the silver production at \$152,000,000.

The total dividends and bonuses paid to shareholders to the end of 1917 were \$71,200,000 from the Cobalt Silver Camp and \$11,500,000 from Porcupine and Kirkland Lake Gold Camps, or a total of \$82,700,000.

These are huge figures and yet the mineralized section of Northern Ontario has only been developed to the producing stage in three or four comparatively small areas. A vast extent of territory is entirely undeveloped though several new districts are at the present time being explored by the older established mining companies as well as by syndicates and individuals with a view to opening up new deposits of gold and silver.

It may be said, without fear of serious contradiction, that the chief companies producing gold and silver in quantity are ably, efficiently and economically administered and several of the large producers are carrying on exploration work in new gold and silver districts with a view to prolonging the productive life of their organizations. This must be considered a wise policy, as the acquisition of new producing territory tends to make the shareholders' dividends more secure and to add to the stability of their investment. A further advantage, both to the Government and the shareholders, is that administrative ability and mining brains, combined with ample capital, insure intelligent, efficient and thorough development of Ontario's north country which has been proven to be so rich in mineral resources.

Many changing economic conditions have made it increasingly difficult to carry on mining and exploration work in the North country. Chief among these is the scarcity and high price of labor (accompanied in many cases by a marked decrease in efficiency); the high cost and slow delivery of materials and machinery, and the fixed price of gold. As against these features, the rapid rise in the price of silver has enabled the silver producers to meet these adverse conditions and has encouraged them to increase their output.

Gold properties are finding it increasingly difficult to carry on operations, several producing mines having cut off dividend payments and others having closed down altogether. The gold mines are in somewhat the same position as traction companies who have a fixed rate of fare and rapidly mounting operating expenses.

This condition is causing grave anxiety to the different Governments who have made huge issue of gold bonds and it is understood that discussions are now under way to find some means to, at least, maintain, if not increase, gold production. Many suggestions have been made to obtain larger production such as: Chinese labor, bonuses to producers, remitting taxes, etc. It is a difficult question to adjust as long as cost of production continues to increase, as gold—the basis of all values—must remain stationary.

Notwithstanding many adverse working conditions and difficulties, the Northern Ontario mines have during the war period added very materially to the prosperity of Ontario as a whole and will undoubtedly

continue to do so for very many years to come. New producing areas are developed to a large extent by individuals or syndicates providing the necessary financial backing and every possible safeguard should be provided to protect this important source of development money and see that it gets a "square deal." Speculators are satisfied, usually, if they get a fair chance and have assurance that their money goes into legitimate development work.

While increased cost of labor and material must be faced as a result of war conditions and the consequent high cost of living, there are other adverse conditions which the Government can and should control. The wonderful dividend record mentioned above has attracted certain unscrupulous and self-styled mining brokers and promoters. Their operations begin with the securing of a Government Charter and a lot or two of worthless land. Circulars issued widespread contain the most reprehensible statements about profits to purchasers of the shares. The results are large profits to the "broker," very little, if any money for development and, in most cases, total or large loss to the unfortunate investor. Operations of this class are not infrequent although absolutely prohibited by law.

Misrepresentation of this kind, with consequent heavy losses to a very large number of investors in Canada and the United States, has given these brokers a bad name. It has also caused a feeling that investments in mining securities are dangerous. Many legitimate investors and speculators have been driven away from mining securities on account of lax and questionable methods employed in their purchase and sale. This attitude towards mining securities is widespread and the blame must be placed firstly, on the mining brokers themselves on account of the methods employed by some of them in buying and selling and, secondly, on the legal department of the Government which appears unwilling to put laws, already on the Statute books, into effect.

Ontario has a great heritage in the North Country and everything possible should be done to protect legitimate development work and the legitimate mining investor and put a stop to unscrupulous exploitation.

RICE CAUGHT AGAIN.

New York, Aug. 1.—George Graham Rice, former convict, who is now in the stock brokerage business, was arrested last night, charged with using the mails to defraud.

The specific complaint was lodged by R. W. Hartman, of Mansfield, Ohio, who alleged he entrusted \$721 to the prisoner for the purchase of stocks.

Rice, whose true name is Herzog, was arrested on a warrant issued by direction of Postoffice Inspectors McQuillan and Hunsberry, who declared Hartman's complaint was one of many similar ones.

A "sucker list" of 53,000 names was one of Herzog's assets, Federal officials declared. His monthly office expenses aggregated \$200,000. An estimate of his income since his release from the penitentiary four years ago made by Federal authorities placed his profits at over \$2,000,000.

In order to stimulate the production of platinum in Canada, the Hon. Martin Burrell, Minister of Mines, has authorized the purchase of the metal at the Dominion Assay Office, Vancouver, B.C. It is believed that this arrangement will prove a great convenience to small producers who, in the past, have found it necessary to market their product in the United States.

Spiegel Eisen, \$75 for 16 to 18%.

ALBERTA CAN SUPPLY COAL FOR ONTARIO.

In a letter to the "Globe," H. C. Anderson, of the Twin City Coal Co., Ltd., says: "At the present time it is a most conservative statement to say that Alberta could supply Ontario with 2,000 tons of choice domestic coal each day for the next six weeks at least. If the weather continues mild that quantity of coal could be shipped for the next sixty days.

GRANBY STRIKE SETTLED.

Victoria, B.C., July 29.—The strike at Anyox, B.C., the smelter centre of the Granby Consolidated Mining and Smelting Co., has been settled and the plant is in operation again after two weeks of comparative inactivity. Mr. F. M. Sylvester, general manager, issued the following statement dealing with the walk-out: "The return to work of the men at Anyox is consistent with the usual good sense and spirit of fair dealing that may be relied upon to a large degree in Granby employees. While we deplored a shutdown of the plant at this time, when Allied demands for munition materials, including copper, is at its highest, making it necessary, as it did, for us to curtail the regular shipments of our quota of copper and thus augmenting the already substantial decrease of copper produced during May, June and July, we believe that much good will result from the vacation of the last two weeks. For some time, more than a year I would say, we have known that sinister influences have been at work at Anyox, among the men, both at the beach, where the smelter is located, and among the miners at the mine camp. You may call that influence by any name you like, I. W. W. 'ism, social unrest, or pro-Germanism."

GOLD BANNER.

The consent of the Finance Minister, permitting the Gold Banner Mines to sell stock, has been withdrawn. The Gold Banner Mines, Limited, in their prospectus represented the Finance Department's sanction of the flotation as placing on the enterprise itself the seal of government approval, which, of course, was never intended.

PERSONAL.

Mr. A. Anrep is at Cobalt to investigate peat bogs along the line of the T. & N. O. Railway.

Mr. J. A. Allan, of the University of Alberta, Edmonton, was in Toronto last week. He spent the early part of the summer in the Peace River district.

Mr. L. H. Colé, of the Geological Survey, is in South-western Ontario, investigating sand resources.

Mr. R. C. Wallace and Mr. J. A. Campbell, the newly appointed and retiring Commissioners of Northern Manitoba will make a trip to Hudson Bay, starting this week.

Mr. Albert E. Hall is in France with the U. S. army.

Mr. R. G. McConnell, Deputy Minister of Mines, is on a visit to Western mining districts.

Mr. D. H. McDougall succeeds F. H. Crockard as President of Nova Scotia Steel & Coal Co.

Mr. F. W. Gray has joined the staff of the Nova Scotia Steel & Coal Co.

Mr. L. R. Campbell has been elected president of McGillivray Coke & Coal Co.

Mr. J. L. Parker is general manager for the Diamond Coal Co., Diamond City, Alberta.

Dr. Alfred Stansfield has returned to Montreal from British Columbia, where he has been working in connection with the proposal to establish an iron industry.

Dr. F. D. Adams is in London, attached to the staff of the Khaki University.

Mr. E. L. Bruce, of the Geological Survey, is examining the area between Reed and Herb lakes, Northern Manitoba.

Mr. M. Y. Williams is making geological surveys of oil districts in southeastern Ontario.

Mr. A. Wende has returned to Kirkland Lake after a visit to Buffalo.

Mr. Robert Bryce was in Cobalt last week.

Mr. T. J. Harwood, recently manager of the Schumacher mine, has gone to Los Angeles.

Mr. H. B. Lee, recently manager at the Porcupine Crown mine, has been appointed lecturer in Metallurgy in Pennsylvania State University.

Mr. R. L. Baker, of Toronto, succeeds the late A. M. Hay as a director of West Dome Mines.

KEELEY MINE SOLD.

The old Keeley mine which came into such prominence at the time of the Farmers' Bank smash, has been purchased for \$100,000 by the Associated Goldfields Co. of West Australia, an Old Country concern, which was working it under option prior to the war. An extension of time was asked until one year after the cessation of hostilities, by the buyers. This was granted and the property then closed. The purchasers, however, have now taken up the option of the South Lorrain property, which is being worked with increasing vigor. M. Black, formerly mill superintendent at the Porcupine V. N. T., being in charge.

TEMISKAMING BOUNDARIES CHANGED.

The Temiskaming mining division now embraces the townships of Strathy, Stratheona, Law, Olive, Milne, Askin, Riddell, Cassel and all that part of the Temagami forest reserve lying east of the Temiskaming and Northern Ontario Railway. The new order went into effect August 1.

Oxy-Acetylene Welding and Cutting

Reduces Repair Costs
Saves Time and Money

Oxy-Acetylene Welding is saving hundreds of thousands of dollars annually in Canadian Factories, Mills, Mines, Machine Shops and wherever metal or machinery is used. Broken machinery parts, tools and defective castings are quickly and permanently repaired. Many economies and advantages are derived from welding in construction as well as repairing.

Prest-O-Lite
PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow-pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow-pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it. Address Department C-108.

HOW UNCLE SAM IS ENLISTING COAL MINERS.

The United States Fuel Administration has issued the following:

In order to supply leaders for an intensive campaign for increased bituminous coal production the United States Fuel Administration is appointing in each of the producing districts throughout the country a man to serve as production manager for his district. At each mine a committee of six, to be known as the production committee of the United States Fuel Administration, will be formed; three men representing the mine workers; three men the mining company.

The duties of the production committees will be to stimulate patriotism; to set a good example of patriotic industry; to arrange for local meetings at which patriotism and increased production alone shall be discussed. It is the task of the production committee to make known the fact that there must be a large increase in tonnage if the United States is not to fail in its war work. It will also make clear that it is the duty of every mine worker to work the full prescribed hours during six days each week; to pass upon the reasons given for absence, short hours worked, or any other causes that may have resulted in a loss of tonnage.

In announcing the formation of these production committees James B. Neale, director of production, wrote to the local unions of the United Mine Workers of America:

"You mine workers are like a great reserve army which shoulder the burden of a long campaign in which there can be no let-up or the whole offensive plan will crumble and collapse. Not a man of you would flinch or hang back if he were in France to-day and the order came to advance in the face of the enemy's machine guns. In the same way I am sure you will not falter

when you realize how great the need is for your best efforts at home."

SHIPPING MANGANESE ORE FROM KASLO, B.C.

Col. B. F. Millard, of Seattle, Wash., who is operating a manganese property near Kaslo, B.C., states that in shipments thus far, water in some cases ran over 40 per cent. A drying plant, therefore, is being installed. It is expected that 2,000 tons will be taken out this summer, which was all the ore in sight, although more might be located with prospecting. The ore is being shipped to Pennsylvania.

TESTING GAS FOR GASOLINE SUPPLY.

The natural gas of both Northern and Southern Alberta is to be tested as to its value as a source of gasoline. The work is to be carried out under the direction of Mr. D. B. Dowling, of the Canadian Geological Survey Branch, Mines Department, Ottawa. A start is likely to be made at the Dingman Well, south of Calgary City, to be followed by similar tests in the Viking and Peace River Fields.

PYRITES PROPERTY FOR SALE

A pyrites property of exceptional merit, well located, one mile from main line of railway, handy to water transportation, and unlimited electric power.

Only cash proposals considered. For information and samples of ore, write Box Y, care of The Canadian Mining Journal.

WANTED—

Copper Refiner, to take charge of copper cathode melting plant, casting various shapes, including wire bars. A practical furnaceman, who knows from years of actual experience how to fuse in a bottom, how to train a crew of "green" men, and can himself produce marketable copper, can secure a steady position, and a satisfactory salary, with a responsible smelting company. Apply Box N Canadian Mining Journal.

FOR SALE

ONE DOUBLE SET OF TOOTHED ROLLS, 22 in. diam., 20 in. face. Suitable for reducing any soft material. Complete with drive pulleys, spare shells, gears, springs, etc.

ONE SET PLAIN ROLLS, 23 in. diam., 12 in. face. Suitable for any fine reducing. Complete with drive pulleys, and one set of spare roller shells.

Both machines are as good as new, having run only four months, and are open to inspection.

Will consider any offer. Write for further particulars.

NEW QUEBEC GRAPHITE CO., LTD.
BUCKINGHAM, P.Q.

FOR SALE—

One Litchfield Hoisting Engine, 18 in. cylinder, 32 in. stroke. Two 5 ft. drums with 4 ft. face and grooved for 1 in. rope. In excellent condition. One "WC" Sullivan tandem Air Compressor. Compound steam and two stage air cylinders. Corliss Valve Gear. Capacity 1,800 cu. ft. to 100 lbs. pressure per minute. For full information and price, address:

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

- Fuel Testing Laboratory.**—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.
- Ore-Dressing Laboratory.**—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.
- Chemical Laboratory.**—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.
- Ceramic Laboratory.**—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.
- Structural Materials Laboratory.**—Experimental work on sands, cements and limes is also undertaken.
- Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

- Communications should be addressed to The Director, Geological Survey, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

THE recent decision in the Butte & Superior Suit with Minerals Separation has an important bearing upon the use of the Pneumatic, or Callow method of flotation.

The Appellate Court's decision at Philadelphia, in the Miami case, had already made clear the distinction between (1) froth produced by violent mechanical agitation of the Minerals Separation process, and (2) simple levitation by air bubbles, as practised in the Callow or pneumatic cell, without such agitation.

Now the Appellate Court at San Francisco has interpreted the United States Supreme Court's opinion in the Hyde case, whereby the Minerals Separation Patent was restricted to the use of a minimum, or 'critical' proportion of oil, in combination with violent mechanical agitation.

This latest decision of the Appellate Court in the Butte & Superior case, restricts the Minerals Separation basic patent to the use of a quantity of oil *not in excess of ten pounds (0.5%) per ton of ore, in combination with violent agitation*: it is a logical sequel to the Supreme Court's opinion and confirms the status of the Callow or Pneumatic method of flotation as distinct from the agitation-froth process.

Both the use (1) of oil in excess of ten pounds (0.5%) in combination with violent agitation, and (2) the use of the Callow system of aeration with any quantity of oil, appear therefore to be immune from any charge of infringement.

(Signed) J. M. CALLOW

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

AUCTION SALE of Valuable Graphite Property

Near Buckingham, Province of Quebec, Canada.

The undersigned will offer for sale by public auction at W. A. Cole's Auction Rooms, No. 63 Sparks Street, in the City of Ottawa, Canada, at 2.30 o'clock in the afternoon of the tenth day of September, 1918, the property known as the "Walker Graphite Mine," in the Township of Buckingham, comprising about 1250 acres of land, held in fee simple. The property is situated about six miles from the town of Buckingham, on the Canadian Pacific Railway, between Montreal and Ottawa, and less than ten miles from the landing on the Ottawa River. The quantity of ore is practically inexhaustible, and the mining facilities are exceptional.

The buildings consist of refinery, engine and boiler house, manager's dwelling, foreman's dwelling, and other buildings. The lands are well timbered and contain ample supplies for mine purposes and fuel. The right to cut basswood until the 1st day of March, 1919, has been sold.

A large quantity of machinery, plant and tools on the property will also be sold as a separate lot. Both sales will be subject to reserved bids.

Applications to inspect the property may be made to Mr. Sam. Devine, Buckingham, Quebec, Canada, and further particulars may be obtained from

M. J. GORMAN, Vendor's Solicitor,
Union Bank Building,
Ottawa, Canada.

SERVICE

The Technical Division of Canadian Explosives, Limited, is not merely organized to increase the sale of explosives. It is their function to assist and advise regarding the blasting operations of any concern having "explosive" difficulties, and if need be, stay on the job and direct the work until the trouble is removed.

The Technical Division is equipped to take care of the most difficult blasting problems. Every man is an expert, experienced in actual work.

Put your blasting difficulties up to us.

CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO

No. 17

A big operator says:
"There is only one way
to cut out pay time dis-
putes and that is to let
every man print his own
time record on a modern
Time Recorder so he is
satisfied it is right."

Cut Out the Pay-Time Disputes Get More Production

A factory where a loose time keeping system is tolerated is like a hand with a running sore—it will never do its best work. Working time is too costly these days for you to lose a minute of it. Good operatives are too scarce for you to run the risk of losing them because your time keeping system is out of date.

International Time Recorders

are made so that each employee delivers you a printed, mechanically accurate record of his working time, overtime, etc. You both know it is correct—it is bound to be satisfactory. The time sheets form the basis of a quickly made up pay roll saving endlss hours of figuring by the cashier.

*We make time recorders, master clocks, etc., to suit the
mining business. Send you our latest folder.*

ROCK DRILLING POWER

- Trouble in bottoming deep holes?
- Get hung up on slips and pockets?
- Steel bound by dust collars?

Sullivan Hyspeed Drill drifting at Joplin, Missouri

Sullivan Drills on Lewis Hole Tripods drilling 30-foot toe holes in an open pit iron ore mine in Michigan

Time to try a **SULLIVAN HYSPEED DRILL**

For hitting power and pulling strength, *Hyspeed* Drills have won a reputation in such districts as Joplin, Missouri and Northern Michigan.

Hyspeeds are strongly built, powerful Rock Drills. They are meant for tough work, and they get away with it when less substantial drills quit. *Hyspeed* Drills are easy to handle. They run sweet and true under the heaviest strains and are economical of air and repairs. 2½, 3, 3½, 3¾-inch sizes.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

One reason why the miner likes the "JACKHAMER" is the automatic steel holder. This device is a great help in withdrawing steels and when not in use the steel-holder can be quickly swung up out of the way--as in the illustration below.

Conserve Your Man Power and Reduce Operating Expenses

The first is absolutely necessary from a patriotic standpoint—the second is the first thought of every successful business man. Both can be accomplished when you install the “New Cleveland” Stoper in your mine. It has speed, with staying power and efficiency, double that of any other drill on the market. It has lower operating expenses, because of its low air consumption, and its economy in repairs, through its drop forged parts of simple design which are practically unbreakable.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

PRINTING AND PUBLISHING

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing and distributing Annual Statements, Special Reports, Descriptive Pamphlets, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction.

We shall be glad to furnish estimates to enquirers.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - **Halifax, N. S.**

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,510; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

68 No. 6 Wilfley Concentrating Tables at the New Jersey Zinc Co. Plant

Latest Model
No. 6 Wilfley Table

Wilfley Tables were used at this plant for many years, and when 68 additional tables were required for increasing capacity—there was but one choice—*Wilfley Tables*.

During the past 20 years more than 22,000 *Wilfley Tables* have been built, and more of them are being purchased today than ever before.

The universal popularity of *Wilfley Tables* is due to the following reasons;

Highest efficiency in metallurgical extraction—

Great capacity—Mechanical perfection—

Extreme simplicity of construction.

The *Wilfley* will recover the biggest percentage of values from your ores, and do it at the lowest cost.

Write us about
your concentra-
ting problems—
our engineers
will gladly co-
operate in
studying your
requirements.

KLIM
IN POWDER FORM

Cheapest to Ship Most Convenient to Use

Klim is pasteurized separated milk in the most satisfactory form—powder. It bulks smaller, and weighs less than any other form of milk. Saves on freight bills.

Klim does not require a refrigeration system to keep it fresh and sweet. It can be used from the tin as needed. Mix dry with flour, sugar, etc., or whip into water for use as liquid. Always ready—no waste.

Klim is packed in 10-lb. tins—6 tins to a case. At your supply house.

Klim is genuine—the flavor proves it.

Speaking at the opening of the National Exhibition at Toronto Lord Shaughnessy said: "It will be necessary to establish a good relationship between employers and employees, and a unity all round for the commonwealth. Everything that will enable us to overcome all difficulties must be closely studied, and, where changes are necessary to meet conditions, we may be relied upon to make them without delay." Better understanding between labor and capital is generally believed to be one of the big results of the war, and it is interesting to note that the head of our biggest corporation is taking a leading part in the endeavor to solve in the interest of Canada the problems of the immediate future.

U. S. MINERS TAKE PLEDGE.

"So long as the war lasts I'll stick to my job and do an honest day's work, six days a week and overtime if necessary. I'll do anything else the President of the United States asks me to do. So help me God."

This pledge has been taken in scores of great establishments in the United States and is being adopted in the coal regions. Recently at Butte it was taken by 10,000 men as the miners were lowered underground.

COAL THE KEY TO VICTORY.

During recent weeks there have been a number of interesting statements made concerning the part that coal is playing in the war. The message from Marshal Foch to the meeting of the Coal Miners' Federation at Southampton should help to divert more attention to the necessity of producing coal.

In England, Baron Calthorpe, the Coal Controller, says that the supply was 36,000,000 tons short this year and several million tons will be required annually for the American army in France. Increased output is being planned for and consumption will be kept down by a rationing plan.

In the United States the fuel administration has announced the appointment of 28 production managers. Each will have charge of the campaign for increased production in his district. To him will report a committee of six, three representing mine management and three representing workers. Where a mine is failing to produce maximum tonnage it will be up to the production committee to learn the cause and institute improvement. Each week the committee will post names of the men who have been absent, who have worked short hours or have loaded less than a fair amount of coal.

In the United States there is recognition of the fact that coal is a basic necessity in the manufacture of munitions of war. The War Industries Board is urging increased coal supply as one of the chief needs for improving the supply of steel, in which there is a great shortage. The enormously increased demand for steel must obviously result in a greater shortage of coal than has yet been experienced.

The situation in Canada is again reviewed in this number of the Journal by Mr. F. W. Gray. During the past three years Mr. Gray has time and again pointed out clearly the folly of ignoring the falling off in production of coal. He has drawn attention to the reasons for the decline and has particularly emphasized the inadvisability of taking so many experienced miners from their work just because they were so willing to share the dangers and hardships in the field of battle. He has repeatedly pointed out that these men, while excellent soldiers, would be better employed at mining coal. In this number he points out that Canada is more in need of a Fuel "Booster" than a Fuel "Controller."

Commenting on the coal shortage, "Saturday Night" says: "Our coal miners are working short hours for huge pay, with the result that they feel that they can afford to loaf a good share of the time, with the result that production is far below normal." "Saturday Night" should retract that statement. Our coal miners

are not responsible for the decrease in production. Many of the best of them are to-day in France. Those that are at their regular occupation are working faithfully and they are not getting "huge pay." Of necessity, on account of the heavy drafts of experienced miners, a larger than usual number of inexperienced men are employed in the coal mines and some experienced aliens are probably loafing; but, as Mr. Gray points out, the coal miners are doing very well and the statements of "Saturday Night" are inaccurate and misleading. The shortage of coal in Canada may be to some extent relieved by appealing to the miners to do more work than usual; but it is absurd to place on the shoulders of the men in the mines the responsibility for the shortage.

The National Exhibition at Toronto opened on August 26th. As usual one of the notable features is the exhibit of minerals of Ontario by the Provincial Bureau of Mines. The educational value of such an exhibit is very great, and it is to be hoped that other parts of the Dominion will be more adequately represented on future occasions.

While the Ontario Bureau of Mines does well in showing mine products at the National Exhibition, the Mining Industry is nevertheless very poorly represented. When we consider that, next to agriculture, mining is Canada's greatest basic industry, it is reasonable for visitors at this great exhibition to expect to see not only a collection of minerals but working models of mines and metallurgical works, and a big display of the machinery used in mining, milling, smelting, and refining operations. The Exhibition is a great success year after year, but it would be more instructive if more attention were given to mining and other basic industries. Is it too much to expect that there will some day be a building devoted to exhibits of the mining industry? We believe that an attempt to show methods used in mining and treating ores would not only be instructive; but would prove to be one of the most attractive exhibits on the grounds.

LIGNITE UTILIZATION BOARD APPOINTED.

According to a Canadian Press Despatch, dated Ottawa, Aug. 22, Hon. Martin Burrell, Minister of Mines, has announced the appointment of the Lignite Utilization Board, which will deal with the problems concerned with the further development and use of deposits of lignite coal in the west.

The appointment of this board, said Mr. Burrell, is the result of negotiations which took place some time ago between the Governments of Saskatchewan and Manitoba and the Federal authorities. The Council for Scientific and Industrial Research and the Department of Mines have for a long time past been closely investigating the possibilities of carbonizing and briquetting lignite coal to make it most suitable for household use, as well as the question of producing by-pro-

ducts such as oil, pitch, ammonia, sulphate and gas. A solution of these problems which would be a commercial success is most desirable. An order in Council was passed some time ago authorizing the Minister of Mines to enter into an agreement with the Governments of Saskatchewan and Manitoba, which should provide that they would contribute one hundred thousand dollars each and this Government two hundred thousand for the purpose of establishing an experimental plant and for investigating and experimental work whether before or after the establishment of the said plant, as might be deemed necessary or advisable.

The matter was somewhat delayed during the absence of the Prime Minister of Manitoba in England, but the agreement was accepted by all three Governments recently and a board has now been appointed. Its Chairman will be Mr. R. A. Ross, Consulting Engineer of Montreal, who, in addition to his wide experience as an engineer, has taken a keen interest in the problems under consideration and has been an active member of the Council for Scientific and Industrial Research. The other two members will be Mr. J. M. Leamy, of Winnipeg, Manitoba, Provincial Electrician, and Mr. J. A. Sheppard, a well-known business man of Moose Jaw, Sask.

THE PEACE RIVER DISTRICT.

The Peace River District has been for many years the subject of much interest and speculation. Alluring tales from adventurous pioneers, of its wonderful resources, charming climate and varying scenery, have long since lent to the district that charm of romance which distance and uncertainty blend with glowing promises. Now, however, the land so long famed by legend and mystery is being proved a reality, modern transportation having, so to speak, brought it to our very doors. A journey from Edmonton to the town of Peace River, for instance, which five years ago consumed nearly two weeks of toil and hardship, may now be made in less than twenty-four hours, in comfort at all times of the year. Trains to this latest settlers' Mecca, which is nearly 1,000 miles north of the international boundary line, carry both sleeping and dining car accommodation.

The Department of the Interior, through its Natural Resources Intelligence Branch, has prepared and is distributing a new illustrated report on the district based on investigations made by an official of that Branch during the season of 1917. The publication contains interesting information with regard to climate, soil, agriculture, minerals, game, water powers, transportation, and education. A map of the district showing general topography also accompanies the report.

The recent reservation in the interests of soldier settlement of available Dominion lands has also necessitated the preparation of a map which would show the area in Northern Alberta that had been reserved for such purpose. This publication is now available for distribution, and should prove of considerable value to the returned soldier who is considering the advisability of settlement in the Peace River country, likewise to the prospective homesteader, as it shows the area within which homesteads may be procured, also the total number of quarter-sections that are still available in each township within reasonable distance of a railway. A copy of the report, or map, or both may be procured free of charge upon application to the Natural Resources Intelligence Branch of the Department of the Interior, Ottawa.

The Coal Shortage

By F. W. Gray.

A disturbing amount of misinformation is being circulated about the shortage of coal in Canada and in the United States. The statements which are being made are characterized by bias and entire misconception, and it is therefore refreshing and at the same time reassuring to find that President Wilson correctly appraises the situation, as he seems able to appraise most situations. President Wilson's statement, in part, is as follows: "The existing scarcity of coal is creating a grave danger—in fact, the most serious which confronts us, and calls for prompt and vigorous action on the part of both operators and miners. Without an adequate supply of coal our war programme will be retarded; the effectiveness of our fighting forces in France will be lessened; the lives of our soldiers will be unnecessarily endangered, and their hardships increased, and there will be much suffering in many homes throughout the country during the coming winter."

President Wilson is not given to over-statement, or alarmist messages. When he states that the coal shortage situation is "the most serious which confronts us" it does not seem that his language could be exaggerated. Many serious situations confront the Allies, which it is unnecessary to enumerate, but here we have the executive head of a great and powerful nation stating that nothing is more important than coal.

Readers of the "Journal" well recollect that an identical statement has been made by the writer, and repeated almost 'ad nauseum' from time to time during the duration of the war. A few weeks ago we wrote: "Steel, wheat, ships, guns, shells, men, money—all these things and many others—are but a transmutation of coal, merely the finished product of materials that have been mined, assembled and manufactured with the help of coal. Coal is basic, fundamental. When will the fact be realized?" Lloyd George stated it three years ago. President Wilson has again stated it. And yet it would be difficult to point to any action on the part of our own Government or on the part of the Government of the United States, to remedy the shortage, or to attack the problem at its roots.

The Fuel Controller in Canada, the Fuel Administrator in the United States, and the Coal Controller in Great Britain, have done many and useful things in co-ordinating the transportation facilities, and by the adoption of zoning arrangements have done away with a great deal of overlapping and duplication of effort in the matter of transportation. Great energy has been expended on price fixing for the protection of the public in the matter of the cost of coal. In neither of these courses, however, has there been any attempt to increase the production of coal. Price fixing has in a good many instances had the direct effect of discouraging production. In the case of a product so fundamental as coal, great care should have been exercised—much greater care than has been exercised—to preserve the encouragement to production which always accompanies the retention of the element of gain and profit. It is far, far preferable that the public should pay more for its coal than that coal production should decline.

So far as Canada is concerned the very title "Fuel Controller" expresses a misconception, unless indeed the Government had more in mind the importation of coal from the United States than the encouragement of production at home. What we need in Canada is not a

Fuel "Controller," but a Fuel "Booster." The coal industry does not require controlling, or restricting in any way. It needs to be encouraged, to be enlarged and amplified to the utmost extreme.

As an example of complete misconception of the cause of the coal shortage witness the Hon. Frank B. Carvell's recent statement that the miners in Canada are only working 75 per cent. of their time, and are getting such large wages that they can afford to loaf the rest of the time. This is a sweeping, and evidently unconsidered statement. So far as Nova Scotia is concerned, the record of the miners will bear comparison with that before the war. As the writer has only recently pointed out in the "Journal," the tons produced per miner per day is exactly what it was for years before the war. Their performance shows an average efficiency, or perhaps a slightly increased efficiency when compared with pre-war records.

The reply of the miners of Nova Scotia to Mr. Carvell very properly resents his reflections upon them, but here again we find mis-statements and bias. The miners state that the coal companies are unable to take away the coal produced by the miners "on account of shortage of material, such as rails, nails, sleepers, boxes, etc., compelling experienced miners to lose time occasionally on this account."

This statement is full of inaccuracies and a moment's reflection will show that this is so, because no coal operator, whose business and sole occupation is the production of as much coal as possible, would tolerate a condition that limited the output of coal if it were within his power to remove it.

The fact we have just quoted, namely, that the coal miners are producing exactly the tonnage per man that they produced as an average performance for years before the war, and also during the war, is sufficient refutation of any statement to the effect that there is restriction of the production of the individual miner at the coal face.

What, then, is the truth regarding the coal shortage and its cause? No situation is entirely simple, and there are a number of causes which have assisted to bring about the decline in coal production, but the chief cause—the cause that is so outstanding in its effect as to belittle all the other accessory causes—is the enlistment of miners. By miners we mean men actually engaged in digging coal at the working face. The men employed on the surface and in the same proportionate numbers as the mining coal class.

What is the remedy? Unfortunately, there is no remedy. Palliation of the evil is all that is possible. Some little can be done by the introduction of mechanical devices in substitution for manual labor, but this course can only have a very limited application. Some help can be given by transferring surface employees and auxiliary workmen underground into the mining coal class, but not much is possible in this direction, because the men who are not to-day employed in mining coal are of such a category physically and as to age as to debar them from the work of mining coal. More can be done by closing down small collieries, and concentrating the miners in the larger and more economically worked collieries. This course will throw some men out of employment more or less permanently, but it would give more coal and cheaper coal if followed out rigorously and logically. This is about as far as palliative measures can be carried.

As it is manifestly impossible at this stage of the war to return to the mines the miners who have been enlisted in the armies, it is also manifestly impossible to restore the coal production to pre-war figures during the further duration of the war. One course is possible, namely, to stop all further enlistments of miners. In 1915 and 1916 the writer pointed out on many occasions that the enlistment of miners was going on to an alarming degree, and out of all proportion to the rest of the population of Canada, and stated that the damage thereby being affected was irremediable for the further duration of the war. Nevertheless, in the application of the Military Service Act the authorities did not except miners, and notwithstanding the dangerous reduction in coal production which had taken place by October, 1917, a large number of coal producers have been since taken by the selective draft. The Canadian Government properly said they considered the military danger was such as to overshadow the necessities of industrial production, and they refused the application of the farmers who made such dramatic and persistent attempts at Ottawa to have farm workers excepted. But coal production is not an industrial matter to-day—and, moreover, since this war started it has never been an industrial matter. It is a military matter, the first of all military matters in a modern war. Look back over the history of the war. In 1914 the first step after the mobilization of the fleet—which, it is to be remembered, was mobilized by the aid of coal—was to guard the Empire's credit and exchanges. The most important single item in the matter of maintaining Britain's credit and the exchange rate has been coal, for coal and gold are interchangeable terms when exchanges are in question.

In 1915 we were told the chief need was for high explosives and artillery. The munitions question is merely a phase of the coal supply, for whether guns, shells and high explosives were made in England or America, their origin, manufacture and transport was all a matter of coal supply.

In 1916 and 1917 the submarines of the Central Powers placed Britain in a dangerous position, and the cry was then for ships, and more ships. Ships again are but an outgrowth of coal production.

The submarine brought England to a dangerous pass through food shortage, but this shortage did not arise from any real failure of food supplies throughout the Empire, but was caused by the shortage of freighting steamers. Ships cannot be built, nor can they cross the seas without coal.

Recently the question of man-power has been apparently paramount. But what is the use of large bodies of soldiers, and great reserves of man-power, if they cannot be mobilized, fed, trained, armed and sent to the field of battle. And yet none of these things can be accomplished without coal.

Coal and iron have been lodestones to the Germans throughout the war. Iron is useless without coal to smelt it, so the matter resolves itself again into a question of coal supply. Why did the Germans venture their slim expeditions into the Don Cossack country and push their way to Ekaterinslav? Because there are to be found valuable deposits of anthracite. Why did they desire the district around Lodz in Poland? What did they seek in Belgium, and in France north of the Somme? What do they lust after yet in that part of Holland which borders on the Campine coalfield? Coal supply, because they know its value as no other nation knows it.

The general public is not aware of the straits to which France was reduced by the Germans gains made this spring in the northern coalfields of France, nor how greatly these gains increased the strain upon the transportation facilities of England. What is the overpowering, crying need of the Scandinavian countries, of Holland and Spain? Not wheat or food, but coal. The greatest lever that yet remains to Germany in her dealings with the small neutrals that surround her is her ability to give them a coal supply. Italy, Greece, the whole Mediterranean littoral, is dependent on Britain and America for coal. Britain's effort has been stupendous. The effort of the United States is already great, and will probably reach unexampled dimensions, but it is doubtful if any but the smallest percentage of the citizens of Britain or America realize the part that coal has played, any more than they realize the limitations that will be imposed on these efforts if coal is not forthcoming in the necessary quantities.

Is it too much then to say that the production of coal is not an industrial matter, but a department of national defence?

A great deal has been said and written about the suffering which may result in North America from a coal shortage among the civilian population, and properly so, but if the coal output should prove insufficient for the requirements of the armies and the navies of the Allies, the needs of the civilian will receive scant consideration. He may, indeed, freeze to death, and he will be allowed to freeze to death, before the Allied Governments will allow the movement and the munitionment of their armies to be imperilled.

It is about time that responsible people ceased to talk about the hours worked by the miners, or to worry about the supposedly high wages he is earning, or the supposedly high selling prices received by the coal operators, and got down to a realization of the fact that the coal production has been reduced **exactly in proportion to the miners who have enlisted**, and that it can only be restored by bringing back the men who have gone, or such of them as are left alive.

In face of these facts, it is stated that the citizens of Winnipeg are still debating whether they can stand the annoyance of using soft coal mined in Canadian collieries in place of anthracite imported from the United States. When it is considered that practically nothing but soft coal is used in Nova Scotia, and that anthracite is unknown in Britain and Europe as a domestic fuel, the attitude of the Winnipeg people is amusing, in August, but it will be a tragic recollection next January.

The production of coal in Nova Scotia is two and a half million tons per annum below pre-war figures. The production of coal in the Canadian West has increased, but it also is still far below pre-war figures, and also, like Nova Scotia, far below the capacity of the existing collieries. There are said to be collieries in the Canadian West that are not working full time because of lack of outlet. This is not the case in Nova Scotia. There the coal shortage is altogether a matter of labor. There is market and to spare, for Nova Scotia used to send two million tons of coal per year to Montreal, but for several years the Province has exported little or none at all to St. Lawrence ports. If there is any Canadian colliery that is not working every day to the full capacity of the men that are left to work in it, this is a question that demands the immediate attention of the Government. Questions of cost and trans-

portation are of secondary, and even negligible importance to-day where coal supply is concerned. All previous ideas of economics and trade channels should be scrapped in this matter if they interfere or lessen coal production. Everything, price, wages, transportation costs, convenience, vested interests, custom and precedent should give way to the paramount necessity of increasing the available supply of the most important munition of war.

It is a sample of our topsy-turvy conceptions of war needs that we have Ministers of Blockade, Ministers of Propaganda, Ministers of Munitions, of Shipping; and Bureaus and Departments without number, but the creation of a responsible Minister of Mines with some real powers has not occurred either to Canada, the United States or Great Britain. Neither does there appear to have been in the legislatures of any of the Allies men with scientific and mining knowledge sufficient to place the question of coal supply before our Governments in its true importance. There was really no need, had such representations been made and heeded, for the decline in coal production that has actually taken place, for the number of men employed in the coal mining industry—particularly those men employed at actual coal digging—is numerically small compared with the all important influence of coal supply on all other industries, and the retention of these men in the collieries would have been of greater advantage from a military standpoint than the advantage gained by their enlistment.

In making this statement the writer does not wish to be understood as belittling the value of the miner as a soldier. He makes the very best of soldiers, and the armies are glad to get the miner, because he is fitted by his training and his inherited physique for the arduous calling of the soldier. All this is well known and admitted, and yet the coal miner cannot be more advantageously employed, if the winning of the war is desired, than in mining coal.

Canadian territory has not been invaded, or even threatened. Our man-power has not been called to the ranks in anything like the proportion of French and English experience, and yet our coal production has shown proportionately the most disappointing decline of any part of the Empire. This is not as it should be, and it is not a pleasant thing to contemplate.

PLANNING FOR MORE COAL.

The Wall Street Journal says: The fuel administration has adopted a plan whereby it hopes for a material increase in coal production. Briefly, this comprehends a director of production; under him, 28 production managers, one for each coal-producing district. These managers will have charge of production committees formed for most of bituminous mines, committees of six being divided equally between representatives of mines and operators. Each committee is to look after production of its own mine, locate blame for a weekly production less than maximum and report to the local production manager.

As our coal requirements now run about 80,000,000 tons ahead of normal output, every possible means of increasing the supply should be employed. Not a gun or a shell can be made without coal. Manufacture and transportation of everything going to make up and maintain an army depend upon coal.

But however good this plan may be, it seems as if there is room for improvement. There would be no need of any further suggestions if every miner were aroused to the issues of the war. Many are. There

are men of intelligence and good education mining coal to-day. One of the most eloquent orators of the Methodist Episcopal church, now a bishop, was once a Pennsylvania coal miner. John Mitchell was a coal miner. One member of President Wilson's Cabinet worked for years with pick and shovel in the Pennsylvania coal mines. There are many more such laboring now in the mines of the United States.

But, likewise, there are many more that could not tell whether the United States is governed by a king or president. They do not speak the language of the United States. They do not know what liberty or self-government means, and perhaps do not care. America represents to them a place where they can get more pay for a day's work. The war means nothing to them.

We talk about the melting pot. Yet we have never done anything but fill it to overflowing. We expected the material to fuse without any fire beneath the pot. Now is the time to melt this material. It is being done in other callings.

OPENING GRANBY COLLIERY NO. 1 ON VANCOUVER ISLAND, B.C.

Under this heading the Granby News recently published information relative to the Granby Consolidated Co.'s coal-mining property and operations at Cassidy, Vancouver Island, British Columbia, as follows:

"Cassidy, Vancouver Island, is the latest instance in British Columbia of a community being built along modern and progressive lines, and while the development is ultimately to serve the ends of production, at the same time benefit accrues to both the individual and the company. Cassidy is not what might be termed a 'war town,' that is, a community where some munition or other war necessity is being manufactured or produced, and which, when this present and urgent demand shall fall off, may have a decline in both activity and population. On the contrary, while industrial necessity is the prime cause of its establishment, its activity promises to steadily increase, and the work being carried out there assures it a prosperity for the present and an augmentation of prosperity in the future. For at Cassidy the Granby Consolidated Mining, Smelting, & Power Co. is mining coal, the first object of which is to supply material for the manufacture of coke for the company's big copper smelter at Anyox. Incidentally, what surplus coal shall be available will be disposed of in the general market. Already shipments have been made for storage in bunkers at Ladysmith harbor, so that an adequate supply will be available when the coke-manufacturing plant at Anyox shall be ready to receive it. Work on the coke and by-products plants is being rushed, but it will be some time yet before the company will be producing coke for its own purposes.

"Six months ago the site at Cassidy was the usual British Columbia timbered ground. To-day, from an area of 85 acres the timber has been removed, stumps as well, various industrial and residential buildings have been erected or are in course of construction; a circular radial brick chimney 125 ft. high has been erected by the Custodis Chimney Company of New York, and coal is being mined at the rate of 100 tons a day. About 1,250,000 ft. of timber was taken off the property and this is being cut by the company's saw-mill, which has a capacity of about 20,000 ft. a day, 750,000 ft. having been cut to date. To meet building requirements, 2,500,000 ft. of lumber has been purchased from Vancouver Island lumber companies, prin-

cipally from the Victoria Lumber and Manufacturing Company at Chemainus, the Ladysmith Lumber Company, and the Frank Beban Lumber Company, all operating in the district.

"As soon as clearing had been sufficiently advanced, the sinking of three slopes—a main hoisting slope, a return airway, and a travelling way—to cut the coal, was commenced. Sinking operations on the main hoisting slope and the return air way were begun, working one shift, on March 7, 1918, and the material was excavated by the open-cut method up to March 15, when three 8-hour shifts were started and the first car of sand and gravel hoisted.

"The drift material which overlies the coal measures at the point where the three slopes are sunk is a delta deposit and is known geologically as the Colwood sands and gravel, and which in this coal area attain a maximum thickness as great as 200 or 250 feet. The character of the deposit at this point is a free running sand, with absolutely no cementation whatever, which makes it a very difficult ground to handle. It became necessary from the commencement of sinking operations to use forepoling or piling which were driven skin to skin ahead of the face on the top, bottom, and sides, with a heavy battering ram, and the face of slope also had to be breast-boarded closely to prevent the loose sand running in at that point. Water was encountered at a depth of 15 ft. below the surface where the coarser sands gradually gave place to finer until at a depth of 2 ft. the material was a fine quicksand. From this point until the coal measures were reached a special type of spiling was used. This consisting of 4 by 6 in. fir lumber, grooved and tongued, to make a perfectly tight joint. The special spiling was necessary to prevent the inflow of sand which ran through between the joints of the ordinary 4 by 6 in. spiling when driven skin to skin. With this groove and tongue spiling and considerable quantities of horsemanure, the faces were kept open until the permanent sets of timber were placed. Sinking through ground of this nature is exceedingly slow and difficult, and at times 18 in. in 24 hours was considered a good rate of advance.

"The main hoisting slope was sunk a distance of 145 ft., through gravel and quicksand, at which depth the coal seam was encountered, and the first car of coal was hoisted on June 29. This, however, was not the first coal hoisted from the mine; that occurred on April 20, when coal was taken from the travelling slope or manway.

"The sinking of the travelling slope was not nearly so difficult as that of the two other openings, as there the sand contained very little water. Sinking of this slope was commenced on April 3, and the top of the coal seam was encountered on April 29 at a distance of 95 ft. from the portal.

"Coal is being mined from what is known as the Douglas seam, one of three seams of high-grade bituminous coal existent on Vancouver Island, the two others being the Newcastle and Wellington seams. The company has 800 acres of this coal land, with a 10-ft. seam, assuring a supply which will last for many years. While the present output is but 100 tons a day, this is only of coal being taken out in the course of development and getting the mine ready for an ultimate production of 1,000 tons a day of 8 hours.

"Transportation facilities are very convenient. Cassidy is situated on the Esquimalt & Nanaimo railway, which runs from Victoria through Nanaimo to Courtenay and Port Alberni, while a spur provides connection with the Granby Co.'s colliery.

"To produce 1,000 tons of coal per shift, 500 or more men will be employed. Hygienic arrangements for this number of men will be as perfect as modern methods will permit. The change-house, supplied with hot and cold water, showers, baths, etc., is situated conveniently to the three slopes mentioned, these being but a short distance from and parallel to each other. Right at hand, too, will be the mine-rescue station, mine office, and supply house. These essential surface buildings have been arranged as a result of practical experience and it is expected they will tend to the utmost efficiency.

"The rooming-house, a two-story fireproof building, will give to the single men accommodation unexcelled by any building of its kind. It will be 100 by 140 ft., built in the shape of a double L, with 76 rooms, all opening to the outside. Each room will have hot and cold water and, in short, every convenience common to the ordinary household. The mess-house, 75 by 125 ft., will be situated handily, and in this, too, practical experience has been turned to account, so that construction and facilities are to the end of best service.

"For the employees who have families, dwellings are being erected. These are of no fixed design, but the style of architecture is the same as may be seen in the newer parts of Vancouver and Victoria. The houses are handsome in appearance and contain every convenience, such as hot and cold water, bath, cooling chamber in connection with pantry, electric light, etc. These dwellings range in size from three to eight and ten rooms, their cost ranging from \$2,500 to \$7,000 each.

"Water for domestic purposes is obtained from the Nanaimo river, which runs near by, the water being pumped from a filter basin to storage in tanks on an elevation which gives a gravity pressure of 65 lb. Sewage disposal is by means of septic tanks, the soil being admirably adapted for this purpose, being light with much gravel.

"One of the striking industrial features on the surface is the radial brick chimney, which the Custodis Company erected in the very short period of 12 days. At its base the boiler and power-house are being built. The boiler-house will contain two 350 h.p. water-tube Stirling type boilers made by the Babenhausen Company and fitted with automatic stokers. The equipment of the power-house will consist of two direct-connected generators, one of 400 and the other of 250 kw. capacity; a cross-compound compressor, capacity 2,500 ft. of free air per min.; and pumps for fire protection, etc. Electric energy from this power-house will drive the various units about the mine, including a fan of 150,000 cu. ft. capacity, machine-shop, carpenter-shop, tipple, mine-haulage, pumping and lighting for the industrial part of the plant and for the dwellings.

"The carpenter, machine, and blacksmith shops are situated convenient to the top of the slopes. Here will be constructed the mine cars in which coal will be hauled from the mine up the hoist slope, proceeding thence by gravity to a chain haul which will elevate them to the tipple into which the coal will be dumped for cleaning and classifying and then loading into railway cars.

"In charge as superintendent is Mr. Geo. L. Fraser, whose experience in connection with coal-mining has been extensive and varied. He is an old Granby Company employee, well known in both Boundary and Anyox districts. Assisting him is Mr. J. W. Powell, mine manager. To both these men credit is due for their cordial assistance in presenting these facts concerning the colliery at Cassidy to their associates in the employ of the Granby Company."

CANADA'S PRODUCTION OF MUNITIONS OF WAR.

The following figures give a summary of Canada's accomplishments, during the last four years, in the production of munitions of war:

Total number of shells produced	60,000,000
Approximate number of components represented by above, for which Imperial Munitions Board has let separate contracts	670,000,000
In addition to the 60,000,000 of shell produced, there have been a great number of components exported, such as forgings, cartridge cases, primers, copper bands, time and graze fuses, exploder containers, friction tubes, etc. In the production of this war material steel has been used to the amount of	1,800,000 tons
(About 75% of this steel is Canadian product.)	
Quantity of high-grade explosives and propellants produced	100,000,000 lb.
Value of orders placed by the British Government through the Imperial Munitions Board	\$1,200,000,000
Amount of orders already executed ... (This figure represents the actual amount of cash disbursements.)	\$1,000,000,000
Amount furnished by Imperial Government for above purpose from sources outside of Canada	\$400,000,000
Amount loaned to the Imperial Government by the Government of Canada and by the Banks in Canada for purposes of the Imperial Munitions Board	\$600,000,000
Approximate number of contractors in Canada amongst whom contracts for munitions have been distributed ...	1,000
Number of workers engaged in war contracts	200,000-300,000
Approximate number of persons employed in handling stores in transportation and other collateral organizations	50,000
Approximate total number of workers	350,000

The following is a brief sketch of the growth of the munitions industry in Canada:

Shortly after the outbreak of war, inquiries were made of the Department of Militia and Defence by the War Office as to the possibility of obtaining a supply of shell from Canada. Ensuing negotiations led to the appointment by the Minister of Militia, in September, 1914, of an honorary committee, known as the Shell Committee, to undertake the task of supplying shrapnel shell to the Imperial Government. Its status was nominally that of contractor to the British Government, but really that of agent for the purpose of placing contracts on behalf of the War Office.

Basic steel, the only kind of steel made in Canada, was found by experiment to be suitable for the manufacture of shells. The first shipments of shell from Canada, in fulfilment of the orders placed by the Shell Committee, were made in the month of December, 1914—a little over three months from the inception of the undertaking. By the end of May, 1915, approximately four hundred manufacturing establish-

ments in Canada were engaged in the manufacture of shells or the component parts thereof.

By November, 1915, the Imperial Government had placed orders in Canada for munitions to the amount of, approximately, \$300,000,000. This represented such a great volume of business that it was considered desirable to form a Board directly responsible to the Imperial Ministry of Munitions. The operations of the Shell Committee, therefore, were passed over to the Imperial Munitions Board. The general policy of the Committee, maintained by the Board, was that of eliminating the middleman and dealing as far as possible with those who would actually perform the work. In pursuance of this policy raw materials of every description were purchased and passed on from contractor to another, each being paid successively for his labor. This plan had the advantage of saving the contractor large investments of capital otherwise necessary to produce complete shell, and at the same time of enabling a proper distribution of the materials available so that the maximum production might be secured. Contractors were given the opportunity to pay for their necessary investment of capital from the profits derived from their contracts. Generally speaking, this has been accomplished. Subsequently the business was placed upon a competitive basis.

The work of the Board is carried on by the Chairman, who has full administrative and executive authority. He is assisted by a Board, of whom four members give constant service. Business men have been asked to take charge of the various departments, numbering about twenty. These Directors carry on their duties in Ottawa, in Toronto, in Vancouver, and in Victoria. The following are details regarding the most important of these departments:

1. The Purchasing and Steel Department buys all the materials entering into munitions, arranges for the forging of steel, and distributes the forgings and components to the machining plants situated in the various Provinces.

2. The Shipbuilding Department purchases and supervises the construction of engines and boilers for the wooden ships referred to below, purchases the timber and supplies for the hulls, and has an operating section which installs the engines, boilers, and equipment in these vessels.

3. The Explosives Department operates the National plants producing nitrocellulose, cordite and T.N.T., with the necessary acid plants, and operates the plant producing acetone and methyl-ethylketone.

4. The Forging Department operates the National plant in which the steel turnings are melted in electric furnaces, and the steel thus produced subsequently converted into forgings.

5. The Aviation Department operates the plant producing aeroplanes, and in its constructional section builds all aerodromes, machine shops, barracks and officers' quarters at the various camps, and purchases all supplies and equipment for the Royal Air Force.

6. The Timber Section producing aeroplane spruce and fir, conducts logging operations in British Columbia, and operates tugs for the delivery of logs to mills which cut them for account of the Board, under supervision of the Board's officer. These logging operations call for the production of 248,000,000 feet of logs in 45 camps placed in a territory extending over 600 miles, north and south.

7. The Fuse Department operates the National plant where time fuses are loaded.

8. The Engineering Department checks and rectifies all gauges, keeping for this purpose a staff of engineers and an operating force of expert tool-makers working in machine shops under their direction.

9. The Inspection is all carried out under the Director of Inspection, a British officer, responsible to the Director-General of Inspection in Great Britain. Several thousands of inspectors are required to do the work.

10. The administrative staff comprises from 1,000 to 1,500 men and women, the number varying with the degree of urgency.

The operations of the Board have gradually been extended into lines of war material other than steel, and the Imperial Munitions Board is now endeavoring to explore and make available for war purposes those natural resources of the country hitherto undeveloped. The forests of Northern British Columbia have been called upon to provide spruce for aeroplane purposes and for wooden shipbuilding. To a lesser extent the timber resources of Ontario, Quebec, and New Brunswick, have been drawn upon for the same purposes. The mines of British Columbia are producing copper, zinc and lead. The Province of Quebec is supplying asbestos, aluminum, carbide, and other mineral products in large quantities. Ontario is providing nickel, silica, and carbides, and in collaboration with the Canadian Department of Mines there has been an extensive production of alloys to be used in the manufacture of high-speed tool-cutting steel.

The development of the explosive and propellant industry in Canada has been an important achievement. It has been the policy of the Board to establish National plants for the purpose of stimulating any important line of production which private enterprise was unwilling or unable to carry on, and at the present time seven of these plants, representing a capital investment of \$15,000,000, are being operated under the immediate direction of the Board. The two largest manufacture explosives, and these, with privately owned plants, have produced up to June 30th upwards of 100,000,000 pounds of high-grade explosives and propellants.

The Shipbuilding contracts placed by the Board have a value of some \$70,000,000. These represent 43 steel ships and 58 wooden ships aggregating 360,000 tons. These contracts are distributed by value as follows:

To British Columbia \$35,000,000; Ontario \$20,000,000; Quebec, \$12,000,000, and to Nova Scotia and New Brunswick the balance.

One National plant is devoted to the manufacture of aeroplanes for training purposes (over 2,500 of which have already been produced), and latterly to the construction of bombing planes for the United States Navy. Aeroplane engines of high-grade are now being manufactured, and will shortly be produced in large quantities for use in fighting machines at the front.

The Board acts as general and exclusive purchasing agent on behalf of the War Office and Admiralty, and the British Timber Controller, Department of Aeronautics, and Ministry of Munitions. In addition, it acts as agent for the United States Ordnance Department in arranging contracts for munitions and supplies, placed by the United States Government in Canada. At the present time American contracts amount to upwards of \$70,000,000, and orders are coming forward in rapidly increasing quantities.

In the report issued by the Imperial War Cabinet for the year 1917, Canada's services to the Empire in the production of munitions are referred to as follows:

"Canada's contribution during the last year had been very striking. 15 per cent of the total expenditure of the Ministry of Munitions in the last six months of the year was incurred in that country. She has manufactured nearly every type of shell, from the 18-pr. to the 9.2 in. In the case of the 18-pr., no less than 55 per cent of the output of shrapnel shells in the last six months came from Canada, and most of these were complete rounds of ammunition which went direct to France. Canada also contributed 42 per cent to the total 4.5 shells, 27 per cent of the 6 in. shells, 20 per cent of the 60-pr. H.E. shells, 15 per cent of the 8 in. and 16 per cent of the 9.2 in. In addition, Canada has supplied shell forgings, ammunition components, propellants, acetone, T.N.T., aluminum, nickel, nickel matte, aeroplane parts, agricultural machinery and timber, besides quantities of railway materials, including no less than 40 miles of rails torn up from Canadian railways which were shipped direct to France."

ORES USED FOR MANUFACTURE OF SULPHURIC ACID.

For the production of all the grades of sulphuric acid in the United States in 1917 the following quantities and kinds of ore were used:—

	Sulphur.	Pyrites.	Gold and Silver bearing pyrites & galena.	Copper-bearing sulphides.	Zinc-bearing sulphides.
Domestic . . .	463,364	376,955	17,380	708,502	584,100
Foreign . . .	20,463	880,183	147,531	152,811
	483,827	1,257,138	17,380	856,033	736,911

In the column headed "Pyrites" are tabulated all the sulphide ores used that are not treated further for their copper, lead, zinc, gold, or silver content. Much of this material doubtless contains small quantities of these metals, but inasmuch as they are not recovered, their presence in the ore is of no economic importance.

A comparison of the different kinds of ore used in 1917 and in 1916 shows that over 210,000 long tons more sulphur, 90,000 tons more copper-bearing sulphides, and 110,000 tons more zinc-bearing sulphides, but 220,000 tons less pyrites were used in 1917.

PUMPING SANDS FROM COBALT LAKE.

Everything is in readiness at the plant of the Mining Corporation of Canada to commence pumping sands and slimes from the bed of Cobalt Lake. The operation is perhaps the largest of the kind ever undertaken in Canada. Upwards of half a million tons of sands and slimes from past operations have accumulated in the bed of Cobalt Lake. The material contains several ounces of silver to the ton, and with silver at \$1 an ounce the value of the whole is large.

The pumping equipment is the most powerful in Cobalt. It consists of two eight-inch pumps one driven with a 100 h.p. motor and the other by a 125 h.p. motor. The capacity of these pumps is estimated at from 1,000 to 1,200 tons of sands and slimes every twenty-four hours.

Changes already completed in the mill will allow of the treating of about three hundred tons daily. This will be gradually increased until a capacity of about 650 or 700 tons daily is reached.—The Mining Review.

SPECIAL CORRESPONDENCE

NORTHERN ONTARIO.

Good Progress at the Patricia Gold Mine.

From a raw prospect to a producing mine in less than nine months is a record that any mining property might well be proud of. This is the actual accomplishment at the Patricia Syndicate property in the Boston Creek District. Before being taken over by Mr. Charles O'Connell and Montreal interests, the property was known as the Boston Hollinger. Since the latter time the company has installed a 40-ton mill and partially developed the property to a depth of 200 feet. Two shipments of gold bullion have been made and a third one is expected to be sent out in a short time.

The new mill is one of the most compact and efficient of its kind in the north. The ore is first crushed to a three-inch ring and fed to a ball mill, where it is ground to the desired fineness. It then passes over the primary plates where about 72 per cent. of the gold content is recovered. After passing over the primary plates it is classified, the oversize going back through the mill while the remainder passes down over the concentrating tables. A total recovery of from 92 to 94 per cent. is obtained by this process. This is made possible by the free-milling character of the ore dealt with.

The grade of ore being encountered at the mine is very high and mill heads of from \$20 to \$22 per ton are considered very ordinary, while assays often run several hundred dollars to the ton. Taken as a whole, the general run is perhaps the highest of any producing mine in the Dominion.

The main vein has been developed to a depth of 200 feet, at which point the average values show a considerable increase over that obtaining at the 100 ft. level. For the entire distance the vein will average about two feet, while at places it widens out to as much as four feet. The vein matter is a bluish quartz, heavily mineralized and containing spectacular quantities of free gold, while the general run of the ore is decidedly free milling.

Miller-Independence Discovery is Important.

During the past few weeks one of the most important developments in the mining industry in the north country has taken place at the Miller-Independence mine in the Boston Creek district. The discovery of a rich vein on the north side of the property with a southerly dip for the first 70 ft. at an angle of 55 degrees and later straightening up to about 62 degrees, and ranging in width from 9 to 12 ft., has given this property a place of prominence, and has added greatly to the general interest and activity of the district. The new shaft being sunk on this vein has now reached a depth of 175 ft., at which point phenomenally rich gold tellurides are in evidence. The tellurides contain approximately 42 per cent. gold.

The Miller-Independence was purchased three years ago by Mr. George Miller and a number of American associates, since which time something like \$300,000 has been spent on the property, including the purchase price. Until the present summer, efforts were centred on the development of a high grade vein, which at times looked like a winner; but this deposit was found to lack the requisite consistency of a profitable producer. A new vein or outcropping was found early this summer by Mr. W. R. Adams, mill superintendent, who was constantly making a study of the geology

of the property. It is a remarkable fact that the discovery was made at a point where the main road crosses the property.

It is proposed to continue the main shaft to a depth of 200 ft., and drive drifts both east and west as was done at the 100 ft. level. This will give four faces in ore to provide feed for the forty ton mill, which is being made ready for operation. A number of additions are being made to both the milling and mining equipment.

The Renaud group of claims, lying adjacent to and south of the Miller-Independence at Boston Creek, was last week reported as taken over by Mr. Robert Norrington, representing Detroit interests. The deal is understood to be still pending. The purchase price is said to run up in six figures and is the first big deal since the recent rich discovery on the Miller-Independence. Exploration work is to be commenced at once, provided no serious hitch occurs. Mr. S. Renaud, who is in charge of the work, is one of the original owners of the property, along with Mr. A. Cullen, both of Haileybury. The trend of the large vein on the Miller-Independence is north of east and it should pass across the southwest part of the Renaud group. Several other veins have been opened up on these claims and in a number of them gold has been found to occur. The geology on the Renaud group is very similar to that of the Miller-Independence.

Electric Power for Boston Creek.

The Northern Ontario Light and Power Company has entered the Boston Creek field. Arrangements are being made for supplying the Patricia Syndicate and Miller-Independence with electric power. The transmission line of the power company supplying the Kirkland Lake mines passes through the Boston Creek field. It will be a comparatively simple matter to connect up with the operating mines of the new camp. The new switch tower has already been completed.

Improving Transportation Facilities at Boston Creek.

A new station is being erected at Boston Creek and a telegraph and ticket office together with a baggage room will be enclosed in a building forty feet in length. In the meantime two freight cars are being used to serve the purpose of a station. A new site has been chosen where the ground is more level than the previous station site and already a number of merchants are moving their places of business to the new location. The roadway leading to the Miller-Independence and Patricia property as well as other promising claims in the district, is fast being put in shape, and the camp is showing signs of general activity.

Developing Lightning River Claims.

Samples taken at a depth of twenty feet on the vein at the Howie-Couchenour Williams claims in the Lightning River district is said to have resulted in commercial gold values being shown. The vein is two feet in width and well mineralized, while the wall rock from one to two feet on either side of the vein carries commercial values. The fact that from four to five feet of ore has been developed by the limited amount of work done, would appear to hold out considerable encouragement for other property holders in the neighborhood. More or less removed from railways and good roads, the opening up of the Lightning River area is necessarily slow. However, should present good results continue to attend the development of properties, it is highly probable a remedy will be found for the present unfavorable transportation facilities.

Encouraging Results in Skead Township.

Late advices from the Skead township gold area are

of a very encouraging nature. Samples taken from the Crawford claims which adjoin the Costello group, show spectacular quantities of free gold. It is also said that mineral having the appearance of tellurides has been found in the vein, which is composed of highly mineralized quartz and red porphyry. The vein is from five to six feet wide.

Work is also being done on the Fidelity property here and the results are said to be proving very encouraging, with the result that the development plans will be still further enlarged. On the property of the Wisconsin Skead Development Company work has not been resumed as yet. On the Martin group nearby, satisfactory results are being met with. The recent discovery on the Crawford claims, taken together with that of the Cook-Myles group and strengthened by the finding of calaverite on the Miller-Independence, less than ten miles to the west, all tend to lend considerable importance to the trend of developments in the Skead township gold area.

Nipissing Production Continues Large.

According to the monthly report of the Nipissing Mining Company, ore to the value of \$304,694 was mined during the month of July, and bullion and residue of an estimated net value of \$877,231 was shipped. Underground operations continued to be of the usual nature and extent. Several new small veins of low assay were encountered in shaft No. 73. The high grade mill treated 172 tons and shipped 842,870 fine ounces of silver. The low grade mill treated 7,058 tons. The following is an estimate of production for the month of July:

Washing plant	\$118,243
Low grade mill	186,451

Total \$304,694

For the month of July, 1917, the company's production amounted to \$272,490. The total production for the year 1917 amounted to \$3,358,972; while for the first seven months of the current year the production of the property has amounted to \$2,223,928.

Kerr Lake's Banner Year.

During the month of July the Kerr Lake Mining company produced approximately 231,000 ounces of silver. This compares with a corresponding output of 189,392 ounces for the corresponding month of the previous year. With the exception of the month of May, which was the highest in the history of the company, July shows the highest production for the current fiscal year which ends August 31st. The current year is expected to prove the banner year in the company's operations. For the eleven months just ended the output amounted to 2,364,122 oz. Provided the output equals that of July the total production for the current fiscal year will equal over 2,595,000 ounces of silver. The production for the past eleven months in detail has been as follows:

Month.	Ounces.
September	210,398
October	213,802
November	205,522
December	203,400
January	204,641
March	207,100
April	201,000
May	268,213
June	210,000
July	231,000

Total 2,364,122

The strong financial position of the company has led to various reports regarding the likelihood of an extra disbursement of the funds of the company being made with the next regular dividend.

Developing Indian Peninsula Molybdenite Mine.

Work on the Indian Peninsula property in the Hurricanaw river district which was recently purchased by the Penn-Canadian Mining Company of Cobalt, is making satisfactory progress. About three carloads of material for the new mill and a number of horses were shipped to the property last week. Every effort is being made to commence the production of molybdenite at the earliest date possible.

Nipissing Tramway Again in Operation.

The aerial tramway of the Nipissing Mining company which was used for conveying ore from the Meyer and Fourth of July shafts on the west side of Cobalt Lake, was put out of commission during a recent fire in Cobalt and took several days to repair. It is again in good working order.

Nipissing in Matachewan Area.

The Nipissing Mining Company has purchased the outfit being used by the Mining Corporation of Canada in the exploration of a group of claims which they had under option in the Fort Matachewan district. The Nipissing will use the machinery for the exploration of a property adjoining the Otisse.

Shipping Ore from Foster Property.

Ore is being shipped from the old Foster mine dump, by the interests which recently acquired control of it. It is planned to ship ore at the rate of about twenty-five tons per day for the first week. This will gradually be increased to between fifty and seventy-five tons per day. Teams will be used for hauling the ore to the railway. It is understood the ore will be treated at one of the local customs mills.

Developing Cochrane Mine from the Temiskaming.

The Temiskaming Mining Company has taken an option on the old Cochrane property, and already work has been extended onto the latter property from the lower ground workings of the Temiskaming. The operations on the Cochrane will be carried on under most favorable conditions, with the aid of the Temiskaming's powerful mining machinery. Under the terms of the agreement the Temiskaming is obliged to spend a minimum of \$1,000 per month in the development of the property. Development work on the Cochrane has been carried to a depth of 500 ft., the last operators of the property being the Crown Reserve Mining Company. The main vein is one of the strongest in the camp, but silver values have so far proven very erratic.

Keeley Mine Sold.

The old Keeley Mine in South Lorrain has been purchased for \$100,000 by the Goldfields Consolidated Mining Company of West Australia, which is an English concern. The property is now being worked with considerable vigor, operations being under the supervision of Mr. H. Black, formerly of the Porcupine V. N. T. property. The English interests decided on the re-opening of the property following an inspection of the property by Dr. J. McIntosh Bell early in the summer. Several tons of ore shipped from the property were said to contain from one to two thousand ounces of silver to the ton. Already a vein has been opened up on the first, or 60 ft. level, which is about five inches in width and is said to be the old No. 8 vein. This vein in places carries ore as high grade as 2,000 ounces to the ton. Owing to the results obtaining on the Keeley and in the South Lorrain section generally, increasing activity is evident.

Gold from Northern Ontario

This specimen, shown actual size, is from the Atlas Property, MacMurchy township, Sudbury Mining Division.

The specimen has been cut and polished, and the polished surfaces are shown above. The lower view is of the natural rough surface.

An Opportunity for Prospectors

The mineral wealth of Northern Ontario is enormous. From a few developed areas a very large output of nickel, copper, silver and gold is being made. Many promising areas are awaiting the prospector and miner.

One of the greatest factors in development of mineral areas is the provision of transportation facilities. Railways and the mining industry have together played a very important part in the development of Northern Ontario.

The Canadian Northern Railway, recently constructed across Northern and Western Ontario, has opened up for prospecting a large territory. Easy access to many promising areas is now available. Geological maps of some of these areas can be obtained from the Geological Survey, Ottawa.

The gold specimen shown on the other side of this page is from MacMurchy township, an area most easily reached from the new line of the Canadian Northern Railway. Discoveries of other metals, including iron, copper and zinc, have been reported from points served by the Canadian Northern.

THE DEPARTMENT OF RESOURCES CANADIAN NORTHERN RAILWAY

The Department of Resources, Canadian Northern Railway Building, Toronto, will be pleased to furnish information about the districts served.

Chambers-Ferland.

The old number two shaft of the Chambers-Ferland mine of the Aladdin-Cobalt mining company has been pumped out, but without revealing any ore. The early work done in this shaft was accomplished in the early days of the Cobalt camp and no records of the work had been kept.

Adanac.

As the north drift of the Adanac continues at the 310 ft. level, the vein is maintaining a width of several inches and the mineralization is increasing. Considerable cobalt ore and nicolite is present in the vein and the outlook is considered very promising. In the meantime the crosscut to the east is being pushed ahead, through ground the geology of which is considered highly favorable for the occurrence of commercial ore. The Adanac is one of the newer operations of the camp and is considered to have good chances for developing into a mine. The aggressiveness of the management and directors of the company in their efforts to locate ore bodies are highly commendable. The work being carried out is on the advice of Mr. Alfred R. Whitman, geologist, and to date has proven up to his general expectations.

Doherty Claims May be Recorded at Haileybury.

A rearrangement of the boundaries of the Temiskaming Mining division took place recently and the new area which is now known as the Doherty district has been included in the aforementioned division with the recording office at Haileybury. This new order went into effect on the first of August and was hailed by mining men and prospectors interested in the Doherty district with much satisfaction. The change removes the necessity of delay and inconvenience in the recording of work in Toronto which was hitherto the case.

Buffalo Reduces Capitalization.

The Buffalo mining company of Cobalt decided at a recent meeting on the reduction of the capitalization of the company by another quarter of a million dollars. Originally the capitalization was one million dollars. In 1917 it was reduced from one million to three quarters of a million dollars, while the present reduction just decided on will leave the capitalization of the company at half a million dollars. Up to the end of 1916 the company had reimbursed the shareholders to the extent of \$2,787,000, and with the two payments made since that date the total returned to the shareholders amounts to \$3,287,000.

The company is treating a number of old dumps which contain ore of low grade, while a considerable tonnage of good grade mill ore is coming from the underground workings of the mine. The huge sand pile is also being treated in the oil flotation plant. A considerable profit is being made in the treatment of this material.

New Vein on Hudson Bay Yields High Grade Ore.

The new vein, containing about four inches in width of high grade silver, discovered last month on the old Hudson Bay property, while cleaning up some old workings of the mine, is yielding quite a large amount of high grade ore. The vein is running in the direction of the Trethewey boundary. The more or less accidental discovery of such a vein may be taken as conclusive evidence of the big possibilities of opening up new high grade veins in other mines of the camp during the course of mining the present known ore reserves, and thus adding materially to the value of the properties.

\$1,500,000 in July.

During the month of July the Cobalt mines shipped approximately three million pounds of silver ore; and during the same period upwards of a million ounces of bullion. With the price of silver at one dollar an ounce the value of the refined silver shipped was approximately one million dollars, while it is conservatively estimated that the three million pounds of ore shipped contained another half million ounces of the white metal. Thus the production of the camp is running at the rate of about \$1,500,000 per month, or eighteen million dollars per annum. The year 1918 bids fair to surpass the previous high record in point of value, which was that of 1912.

High Costs of Production is Closing Down Gold Mines.

In the Porcupine Camp operations being carried on at the McIntyre Porcupine Mine, the Hollinger and the Dome Lake Mines, as well as the Davidson, is resulting in a very material gold output. At the first two mentioned properties the output is being maintained at a rate sufficient to pay dividends at more or less regular intervals, and in all probability this will continue to be the policy of these two companies. However, at the Schumacher, Porcupine Crown, Porcupine V. N. T., and the Dome mines (with the exception of the development under way on this property at the 1,250 ft. level), operations have been suspended, and while the physical condition of the various properties is generally known to be better than at any previous time in their history, the economic conditions make the suspension of operations the most profitable policy. How long this condition will persist is a matter of much conjecture, but in all probability it will continue until the economic pressure is relieved by the cessation of hostilities in Europe. In the meantime the ore reserves of the various mines in which operations have been suspended are not depreciating in value, and will be available when the war is over.

Diamond Drilling at Ankerite.

An extensive diamond drilling campaign is being planned for the exploration of the Ankerite property at depth. Two large parallel ore bodies are in evidence on the Ankerite, which lies a mile or so south from the Dome Mines, Porcupine.

Cotter Property Sold.

According to late advice, the Cotter property has been purchased by interests identified with the Bourk's Mines, at Bourk's Siding. The principals are Toronto men. For a time it was feared difficulties were taking form, in that although the deal was supposed to have gone through last week, a hitch occurred which held up its successful consummation until this week. The Cotter property lies east from the Miller Independence, in Boston Creek.

Encouraging Results at Savage Mine.

Results obtaining at the Savage property of the McKinley-Darragh give reason for more or less optimism. High grade ore has been encountered from time to time, and recently the deposition of silver has shown a tendency toward better consistency, according to unofficial reports. While the Savage has heretofore been found to contain more or less erratic silver deposition, there would appear to be no geological reason why more consistent shoots should not occur. During the past several weeks an aggressive development program has been followed.

Prospecting Doherty Area.

Up to the present, interests identified with the Buffalo Mines have been the most aggressive operators in the Doherty silver area. On the group of claims held

by that company, surface work has been carried on sufficient to more than cover assessment work requirements for the first two years. As yet developments have shown the area to be of prospective value.

Mining Corporation Re-treating Tailings.

The Mining Corporation of Canada has commenced the pumping of the sands and slimes from previous operations back to the mill from the bed of Cobalt Lake for further treatment. The operation is perhaps on the largest scale even undertaken in Canada, upwards of half a million tons of material being available for treatment. This contains several ounces of silver to the ton.

The pumping equipment is the most powerful in the Cobalt camp and consists of two eight inch electrically driven pumps with a capacity of from one thousand to twelve hundred tons of sands every twenty-four hours. Changes already completed in the mill will permit of the treatment of about 350 tons per day and this will be gradually increased to about 700 tons per day. After being pumped from the lake the sands and slimes will be dealt with in three classifiers with a combined capacity of 1,200 tons daily.

The slimes will be treated in the low grade cyanide mill while the sands will be passed on to the tube mills for regrinding and will then go over the concentrating tables to two Groch flotation machines which have been installed. A large surplus of the material from the lake is being pumped up for use in the winter months, when the lake is frozen over. Meantime from underground the Mining Corporation continues to yield large quantities of silver and with the treating of sands and slimes under way the entire plant is again being placed in operation. The company has already produced an amount of silver in excess of the reserve estimated at the close of the last fiscal year, but it is anticipated that heavy production will be continued for some time.

The financial position of the company is exceptionally strong, the quick assets being in the neighborhood of \$3,500,000 and when the probable profit on the known ore reserves is taken into account it is conservatively estimated another million dollars may be added to this amount.

Recently the company discontinued work on the claims which it had under option in the Rickard township district, and according to reports has commenced the removal of the machinery. The claims which were being examined in the Fort Matachewan district were also given up, as has also been the Waldman property, which was being explored by the company. Last week it was announced that the Kennedy claims in the Boston Creek district were to be worked by the Mining Corporation, while it is now said the company are taking an option on control of the Ophir property. Besides their activities in Northern Ontario, a fluorspar property is being developed under the management of this concern in the Madoc district near the town of Peterboro and regular shipments of this mineral are being made in increasing quantities.

Bucke Township Attracts Attention.

Considerable scouting is being done by prospectors in various sections of the township of Bucke. The movement has received added impetus since the successful operation of the Green Meehan, and since the commencement of diamond drilling on property recently acquired at North Cobalt by the Mining Corporation of Canada.

Genesee.

The Genesee has been handicapped during recent weeks by a heavy flow of water at the 500 ft. level, and

progress has not been as rapid as was anticipated. However, additional pumping equipment has been secured and will be pressed into service at once. This will enable the management to proceed with the proposed extensive exploration program along the fault zone encountered early in the summer.

Considerable ruby silver was in evidence along the fault plane during the course of the limited amount of exploration work carried on.

Staking Claims in Thackery.

Considerable claim staking has been going on during the past two weeks or so in the township of Thackery. Quartz veins carrying gold values occur in that area, which fact seems to be attracting a number of prospectors. Gold was found in Thackery upwards of one year ago. The township lies east of the Temiskaming and Northern Ontario Railway, in a direct line between Bourk's Siding and the Lightning district.

According to late advice, the power plant at Sandy Falls, on the Matagami River is being run at reduced capacity, and that during July it served to meet the requirements of the Porcupine mines while repairs and extensions were being made at the Wawiatin plant.

There is no question, however, but that when conditions in the gold camp become more normal, both plants will be taxed to their utmost capacity to meet the requirements of the Porcupine mines.

We were informed here last week that the Sandy Falls plant was now closed.

Mining Ore at Savage Mine.

Three machines are employed on development and breaking ore at the Savage property of the McKinley-Darragh-Savage mine, at Cobalt. Later on it is expected additional forces will be added. As a result of the present work on the Savage a substantial amount of mill rock is being broken down.

ALBERTA COAL PRODUCTION.

The Toronto "Globe" recently published the following: In the Edmonton district of the Alberta coal-fields the mines have been running on low output recently. The Humberstone Mine, which has been producing 550 to 600 tons a day out of a total capacity of 1,000 tons, had to shut down for a week recently on account of lack of orders. Unwarranted reports that anthracite would be shipped to Manitoba from the East caused a falling-off in orders, it was stated by mining men. The Deputy Fuel Controller denied the authenticity of these reports, and re-affirmed the original decision that anthracite would not be shipped to the West. The mining industry of the West has suffered considerable damage as a result of the conflicting reports, as consumers had held off from ordering Western in the expectation of securing anthracite. The lack of orders has had an unfavorable effect on the industry, causing shutdowns. The facts of the case are that no coal will be shipped from the East, for any point except Winnipeg, and even this city will receive very little.

A comparison of the total output of coal in Alberta for the first six months of 1917 and 1918 is as follows:

	1917.	1918
January	514,974	646,338
February	459,408	481,407
March	467,453	435,094
April	211,901	407,087
May	100,165	414,075
June	104,779	*430,000
Total	1,858,680	2,814,001

* Estimated.

Minerals of British Columbia

By E. Jacobs.

The more important mineral products of British Columbia in regard to value of production, are gold, silver, lead, copper, zinc, and iron, among the metaliferous minerals, and coal and coke, the most prominent of the non-metallic products.

Perhaps iron should not be included in this summary, since it has not yet been produced in very considerable quantity, but that it will yet be is the confident expectation of many. In this connection the following excerpt is made from the Report of the Canada Munition Resources Commission, published several months ago: "The people of British Columbia have been making an effort to awaken interest in the establishment of an iron industry in that province, and while it can be shown that ores of merchantable quality exist, and that there is a supply of both fuel and limestone for smelting purposes, there is a notable hesitancy on the part of capital to launch such an undertaking. This condition is perhaps due to the fact that British Columbia does not at present possess a sufficient market to absorb the products of such an industry, and the success of the venture would perhaps rest with the ability of the operators to market their product in the neighboring states of Washington, Oregon, and California."

As there is abundant official information easily obtainable relative to the occurrences and production of the other minerals above mentioned, except, perhaps, zinc, which had not been continuously produced in comparatively large quantity prior to quite recent years, it is not intended to here give information concerning those minerals, an exception being made of zinc so that a quotation may be made from the Report of the Canada Munition Resources Commission, as follows:

"Heretofore the chief source of zinc has been the by-product zinc blende of the British Columbia silver-lead mines in the Slocan, which usually contains silver in varying quantities somewhat increasing its value. The blende is not in sufficient quantity or purity for the usual retorting in Belgium ovens. There has been too much of it to be ignored by the mine owners, and too little of it to make an attractive source of supply for the smelteries. This condition has been investigated by spelter producers and committees, all of whom seem to have arrived at the conclusion that such ores of zinc were unsuited to the ordinary retorting processes and that the supply is not sufficient to justify the establishment of retort smelteries in British Columbia, especially under the existing conditions of high fuel and labor costs.

"The matter is reviewed in the 'Report of the Commission appointed to investigate the Zinc Resources of British Columbia, and the conditions affecting their exploitation,' and in a report by Dr. A. W. G. Wilson on 'Production of Spelter in Canada,' both published by the Mines Branch, Ottawa, in 1906 and 1916, respectively. Some of the features which must be considered with the stimulation of increased prices for spelter and the desire of producers to reduce their own zinc ores instead of marketing them in the United States at little or no profit, are: (1) A desire to make the most of the undesirable blende by-product of the silver-lead mines; (2) the establishment of an electrolytic zinc refinery at Trail, B.C., which promises in time to offer a better market than American smelteries; (3) the large existing reserves of complex zinc

ores which it is expected can be treated at Trail; (4) the probability of new discoveries now that complex or dirty zinc ores are within the possibility of a profitable market."

While there are incidental allusions to one or two minerals occurring in Alberta and Yukon Territory, respectively, practically all the information that follows relates to those of British Columbia. It is not claimed that the list, as here given, is complete, but it is believed to be sufficiently full to be likely to prove of some value to those who are or shall be interested in ascertaining what minerals are known to occur in British Columbia, and who may not wish to go to the trouble of examining for themselves the various official and other publications from which the greater part of the information that follows has been taken.

Actinolite.—A list of occurrences of actinolite (silicate of calcium, magnesium, and iron) in British Columbia is given in Geological Survey Memoir 74, "A List of Canadian Mineral Occurrences," Robt. A. A. Johnston (No. 1497), D.3.

Alunite and Pyrophyllite.—The mining recorder for Quatsino division, Vancouver Island, in one of his official reports (see "Annual Report of Minister of Mines, B.C." 1914, p. K 377): "Besides some development work done, the San Juan Mining and Manufacturing Co. has shipped 75 tons of natro-alunite ore from its property situated on Kyuquot Sound, and has now 250 tons ready for shipment." This occurrence of alunite and pyrophyllite was considered of sufficient interest for the reprinting in the "Annual Report on the Mineral Production of Canada," 1914 (Mines Branch, Ottawa), as pp. 177-182, of a long extract from the report of Chas. H. Clapp, in the "Summary Report" of the Geological Survey of Canada, 1913, p. 109.

Antimony.—In the "Annual Report on the Mineral Production of Canada," 1914 (Mines Branch, Ottawa), p. 57, it is stated that: "In British Columbia some of the lead ores contain a small percentage of antimony—about one-third of one per cent. Some refined antimony was recovered at Trail in 1907 and 1909." During a number of years the antimony in the lead ores treated at Trail was not saved, the cost of recovery having been higher than the then obtainable price.

Probably the best known occurrence of antimonial ore in British Columbia was one in Slocan mining division, West Kootenay district, on a claim situated at a high altitude and distant about ten miles north or northwest of Three Forks. A second attempt to mine ore there on a commercial scale was made in 1915; one carload was shipped to Great Britain and another to Chicago, but results were not made public. More work was done in 1916, and ore was packed down to Three Forks for shipment, but the operator did not meet with much encouragement to continue his venture. Specimens of the ore exhibited contained much antimony. It is understood that Dr. W. F. Ferrier, of Toronto, examined this occurrence of antimony, but, if so, his report is not at hand.

Other occurrences in British Columbia have been reported from Wilson Creek, which flows into Slocan lake at Rosebery, and in the neighborhood of San Juan, Vancouver Island.

Arsenic.—It was reported last year that arsenic had been recovered from a gold-bearing ore mined and milled in Camp Hedley, Similkameen district, but if so

no authentic information has been obtained concerning it. Mr. Chas. Camsell deals fully with the arsenical iron ores of that camp in one of the Geological Survey reports on his geological investigations in Similkameen district.

Asbestos.—From time to time the discovery of asbestos has been reported but, so far as known, no commercial asbestos has yet been found in British Columbia.

Barytes.—The occurrences of this mineral as a pigment of commercial value does not appear to be known in the province. Gold-copper ore with a barytic gangue has been mined in considerable quantity in mines on Mt. Sicker, Vancouver Island; in fact, the smelting of that ore was a successful achievement of Mr. Thos. Kiddie, after he had built the Tyee Copper Co.'s smelting works at Ladysmith, favorably commented on in one of his published official reports by the Provincial Mineralogist for British Columbia.

Cobalt.—The occurrence of Cobalt in a gold-bearing ore found in Omineca mining division, along the Grand Trunk Pacific railway, has been reported in quite recent years, but whether in recoverable quantity commercially has not been ascertained.

Chromite.—Chromite has not been, until recently, of economic importance in British Columbia. It is mentioned that in Tulameen district minute diamonds have been discovered associated with chromite, which is an accessory constituent of the peridotites there (see Geological Survey Memoir No. 26, "Geology and Mineral Deposits of Tulameen," Camsell, pp. 146-153). Recently some chromite has been shipped from Cascade, Mr. P. B. Freeland reported last year that on one claim at Cascade there are lenses of ore carrying 30 to 50 per cent. chromium, while the rock carries 3 to 10 per cent. chromium.

Fluorite.—An occurrence of fluorite near Nelson, West Kootenay, was some time ago investigated as a possible source of production of this mineral, but no commercial result followed.

Early in July of the current year the Grand Forks Gazette reported the acquirement, under lease and bond, by the Consolidated Mining and Smelting Company of Canada, of a fluorspar property situated about 20 miles from Grand Forks, Boundary district, on Kennedy Creek, a tributary of the north fork of Kettle river, into which it flows from the west near Lynch creek. The Gazette made the following comment: "The showing of fluorspar is said to not be equalled by any other property on the continent, and the Consolidated Co. has manifested its confidence by acquiring possession. It intends doing considerable development work and may install a diamond drill to test the immense deposit."

Among other uses is that in the manufacture of hydrofluosilicic acid, employed as an electrolyte in the electrolytic refining of lead. In 1916 the Consolidated Co. resumed at its works at Trail, West Kootenay, the manufacture of hydrofluosilicic acid for use there. Figures showing imports to Trail of this acid during five years, 1910-1914, are printed on p. 244, "Annual Report on Mineral Production of Canada," 1914.

See also "Fluorite," Geological Survey Memoir 74, "Canadian Mineral Occurrences," p. 96.

(Concerning the demand in Canada for fluorspar, Mr. John McLeish, Chief of the Division of Mineral Resources and Statistics, Mines Branch, Ottawa, in the "Preliminary Report on the Mineral Production of Canada," 1917, stated that "there is an annual consumption of fluorspar in Canadian steel furnaces of

from 10,000 to 15,000 tons," while he showed the production in the Dominion to have been 4,249 tons in 1917 as compared with 1,284 tons in 1916.)

Graphite.—Newspaper reports of the finding of graphite have been published, but there has not yet been any production of this mineral in the province.

Gypsum.—Small production was made in British Columbia in 1911 and 1913, but the industry is still in its infancy. In "Economic Minerals of Canada," (Mines Branch, Ottawa, No. 322), on p. 44, the following note is printed: "Gypsum is found in British Columbia at the following places: Salmon river, in the southern part of the Kamloops mining division; Spatsum, on the main line of the Canadian Pacific railway, about 189 miles to the northeast of Vancouver; on the banks of the Thompson river, about 20 miles north of the town of Kamloops; at Merritt, in the Nicola valley, and in Tulameen district, on Granite creek, about 10 miles up the Tulameen river from the town of Princeton."

The Provincial Mineralogist, in the "Annual Report of the Minister of Mines," 1907, pp. L 134-135, briefly describes the deposit at Spatsum. The closing paragraph follows: "The deposit may be said to have a length of at least 2,000 ft., with a thickness of more than 40 ft. The layers comprising the bed are of varying hardness and purity, but there appears to be no doubt that the deposit is capable of providing a large tonnage of very pure mineral. The property is so situated that the mineral could be delivered by aerial tramway directly to the Canadian Pacific Railway track at Spatsum, on the opposite side of the Thompson river."

Hydromagnesite.—In Memoir 74, "Canadian Mineral Occurrences," it is stated, on p. 127, that extensive deposits of earthy hydromagnesite occur in the neighborhood of Atlin; also that hydromagnesite has been met with in considerable abundance in the vicinity of the 180-Mile House, on the Cariboo road.

In the "Annual Report of the Minister of Mines, B.C." 1915, p. K-28, it is noted that a deposit of hydromagnesite near the town of Atlin was worked to some extent in 1915 by Armstrong & Morrison, of Vancouver. It is known that a few hundred tons were shipped, but details regarding the shipment were not received. This occurrence of magnesite was fully described in the "Report of the Minister of Mines, B.C." for 1904.

The following brief reference to the Atlin deposit is made in the Report of the Canada Munition Resources Commission: "Certain deposits of hydromagnesite are found at Atlin, in Northern British Columbia, but their inaccessibility has so far prevented their utilization except for experimental purposes. They would, however, become active producers if steel works should be established on the Pacific coast."

Magnesium Sulphate.—"A deposit of magnesium sulphate, near Kruger mountain, Osoyoos mining division, was worked for a time during 1915. The mineral occurs in a flat depression known as Spotted lake, which is a partially dried-up lake containing alternate circles of water and dry places. The magnesium sulphate occurs as a layer all over the lake bottom, covering a considerable area and said to be of exceptional purity; the thickness of the deposit has not been definitely ascertained. Some 300 tons was extracted and shipped to New York, where a market at a good price was obtainable. The material is used in the drug trade. The nearest town to the deposit is Oroville, Washington, U.S.A., which is distant about six miles." (See "Annual Report of Minister of Mines, B.C." 1915, p. K28.) No information has been received relative to later operations, if any.

In 1917, newspaper reports told of the discovery of an occurrence of this mineral in Clinton mining division, but no particulars have been obtained.

Manganese.—A little information is given in the Report of the Canada Munition Resources Commission relative to manganese ores of Alberta and British Columbia, as under:

"In the early summer of 1917 certain manganese deposits in Southern Alberta were examined by the Geological Survey of Canada at the request of the Commission. The geologists who made the investigation reported the existence of some deposits, from calcareous springs, which contained less than ten per cent. of manganese. The deposits are not regarded as a valuable source of manganese ore.

"Some activity has been displayed in developing an occurrence of manganese ore near Kaslo, on Kootenay lake, British Columbia. This locality was also examined for the Commission by the Geological Survey. Indications at first gave the impression of a small tonnage of 40 per cent. ore, but subsequent development work has uncovered more ore, and the operators have secured license to export several hundred tons to the United States." (Note.—This deposit is situated alongside the Kaslo and Slocan railway, about six miles west of Kaslo. The property is under bond to Seattle, Washington, men who commenced shipment of the ore in June. A district newspaper stated at the beginning of July that "first shipments of manganese ore from the Kaslo district were made two weeks ago, and now ore is being shipped at the rate of two to three carloads a week. The ore goes to a ferro plant at Lebanon, Pennsylvania, for treatment. It is said that the product will ultimately reach the works of the Carnegie Steel Co." So far as known, this is the first time manganese ore has been shipped in bulk from British Columbia.)

Mercury.—There was a small production of mercury from deposits of cinnabar at the western end of Kamloops lake in 1895-1897, but none since. The deposits consist of quartz veins containing pockets of cinnabar in a zone of decomposed Tertiary volcanic rocks. (See "Annual Report of Mineral Production of Canada," 1914, p. 135.)

Some prospecting work was done several years ago in the neighborhood of Sidney inlet, west coast of Vancouver Island, where indications of the occurrence of cinnabar were found. It has lately been reported that the Canada Department of Mines has arranged for one of its officials to examine this occurrence this season.

Several other occurrences in British Columbia are known (see Geological Survey Memoir 74, "List of Canadian Mineral Occurrences," p. 71 and p. 155).

Mica.—Muscovite is found in various places in British Columbia in pegmatite dikes. Some notes on "Mica at Tete Jaune" are printed on pp. K 56-57 of the "Annual Report of the Minister of Mines, B.C." 1915, giving information obtained by the Assistant Mineralogist when in the district several years ago. Tete Jaune is in the northern part of Cariboo district, on the Grand Trunk Pacific railway. The mica claims are situated high up on the rocky ridges of the mountains, on the south bank of the Fraser river, at altitudes of from 5,000 to 7,000 ft. "A very large pegmatite dike, or series of dikes, which is said to be 25 miles long and varying in width from 25 to 1,800 ft., is intrusive into the older rocks along the axis of the range, and extends from below Tete Jaune to Albreda summit, near to Canoe river. This pegmatite is, of course, not exposed continuously along this length, but is sufficiently

so to consider that the various outcrops are linked together, at least not far below the surface. This pegmatite is the usual typical one consisting of large crystals of mica, feldspar, and quartz, with in places a fine-grained intergrowth of feldspar and quartz. The mica occurs in sheets up to 10 in. square and with a thickness, of numerous sheets together, of one inch to two inches. The Albreda group was worked for a time in 1915, and in seven weeks three men took out two tons of mica from a surface quarry. This mica was taken down to Tete Jaune, where it was stored and it was seen by the writer. . . . About 50 per cent. of the two tons taken out would trim into pieces about three by five inches with, of course, some larger than that; the remainder would average about two by three inches. It is certainly good commercial mica, but it is not of the highest quality. It has an excellent cleavage and is not brittle, and would be easy to trim as desired. It is mainly a muscovite mica, but some of it is considerably stained with iron."

See also "Mica, Its Occurrences, Exploitation, and Uses," by H. S. de Schmid, Mines Branch, Department of Mines, Ottawa, No. 118.

Molybdenum.—The first production of molybdenite in British Columbia, so far as official records show, was that from the Molly molybdenite group, on Lost creek, in Nelson mining division, West Kootenay. For particulars of this occurrence of molybdenite see "Transactions of The Canadian Mining Institute," 1915, Vol. xviii, pp. 247-255, or the "Monthly Bulletin" of the Institute, No. 43, for November, 1915, pp. 872-880, by the late Dr. Chas. W. Drysdale, of the Geological Survey of Canada, who stated that Mr. R. A. A. Johnston, Mineralogist of the Survey, reports that there are 20 different localities in British Columbia where molybdenite is known to occur. About 50 tons of molybdenite ore had been shipped from the Molly property up to the time of Dr. Drysdale's visit to it. Later, further development of the property was undertaken, with 16 men employed. A Vancouver, B.C., syndicate had an option of purchase and it proposed to equip the property with a small concentrating plant, but, so far as known, the enterprise was not carried to the point of regularly maintaining shipment of ore.

The Provincial Mineralogist mentions, in the "Annual Report of the Minister of Mines, B.C." 1915, p. K 27, another property, on Alice arm of Observatory Inlet, Skeena mining division. Particulars of this property were obtained in September, 1916, for the Canada Munition Resources Commission, by Prof. J. C. Gwillim, of Kingston, Ontario. In the published report of the Commission it is stated that "Mr. Gwillim was instructed to proceed to British Columbia in the Fall of 1916 for the purpose of reporting on the possibility of the increased production of the ores of molybdenum, tungsten, and zinc. . . . Complete reports on his work, illustrated with maps, photographs, and line drawings, have been filed with the Commission, but publication in full at this time is undesirable from the point of economy. It is probable, however, that arrangements will be made with the Canada Department of Mines to publish the reports at a later date."

See "Annual Report on the Mineral Production of Canada," 1915 (Mines Branch, Ottawa), p. 337, for notes on the Molly mine, mentioned above. Also, see "Report on the Molybdenum Ores of Canada," No. 93, Mines Branch, Canada Department of Mines, Ottawa. Particulars of the Alice Arm property are included in the "Annual Report of the Minister of Mines, B.C." 1916, and of molybdenum in Lillooet mining division, B.C., in Geological Survey publications.

Petroleum.—A note by the Provincial Mineralogist in the "Annual Report of the Minister of Mines, B.C." 1915, p. K 27, is that "prospecting for petroleum by means of boreholes has been in progress in Southeast Kootenay, and on the Queen Charlotte islands, and elsewhere, but oil in commercial quantities has not yet been encountered."

In the provincial "Annual Report" for 1914 there is reprinted, on pp. K 238-242, a report made for the Flathead Oil Syndicate on "The Oil Possibilities of the Flathead District, B.C." (which district is in Southeast Kootenay), by Mr. Ralph Arnold, a well-known geologist, of Los Angeles, Southern California, who for some years has made a special study of oil fields.

Platinum.—"In past years the chief source of the platinum production of Canada was the placer gravels of British Columbia, principally in the Similkameen (Tulameen) district. . . . More attention is being paid to the recovery of this metal, especially in the Similkameen, where it is proposed to re-work some of the old placers. One or two companies operating in the Quesnel River district (Cariboo), report small quantities of platinum with placer gold, but the information is not sufficiently definite for record." (See "Annual Report on the Mineral Production of Canada," 1914, Mines Branch, Ottawa, p. 147; also for table of production.)

The Provincial Mineralogist reported for 1915 (see "Annual Report of Minister of Mines, B.C.," p. K 27): "A small quantity of crude placer platinum has been recovered on the Tulameen river, in the Similkameen district, estimated at about \$2,000 in value. This was obtained from placer-gold workings being carried on, and the results are considered encouraging." Some platinum was recovered in 1915 on the main Tulameen river, and some from Granite creek and probably other tributary streams.

Dr. W. F. Ferrier and Mr. Chas. Camsell paid a very brief visit to Tulameen in November, 1917, when passing through the district from Nicola to Princeton. The former included in his report to the Munition Resources Commission the following notes on platinum: "New work on the Tulameen, B.C., platinum deposits was investigated, but reports of the results obtained were found to be much exaggerated. The year's production was somewhat less than 200 oz. of platinum. The claims of the Contact Consolidated Gold Mines, Ltd., near Paulson, B.C., were examined. Here platinum was reported to occur in the quartz veins and associated dikes. The results of the examination will be handed to you later after the necessary assays have been made."

Information relative to platinum may be found in Geological Survey Memoir 26, "Geology and Mineral Deposits of the Tulameen District, B.C.," (No. 1206) by Chas. Camsell, who made extensive geological investigations during several field-work seasons spent in the district. Brief excerpts from his report follow: "The platinum recovered from the gravels of this district has been variously estimated at 10,000 to 20,000 ounces, and at one time this district was the principal producer of platinum on the North American continent." Above Slate creek "the placers of the Tulameen contain both gold and platinum. . . . The proportion of platinum to gold is greater here than in any of the other localities, and in mining it was found to increase upstream as far as the mouth of Eagle creek, where the greatest quantity was obtained. At hydraulic workings a short distance below the mouth of Eagle creek the proportion of platinum recovered was greater than that of gold, and nuggets of platinum which weighed from

one-fourth to one-half an ounce each were often found." Mr. Camsell's report gives, on p. 143, a table showing the amount and value of platinum recovered from Tulameen river.

Prof. J. F. Kemp, of the faculty of Columbia University, New York, in 1900 spent three months investigating the source of the Tulameen platinum. His report and conclusions were printed in "Bulletin of the United States Geological Survey," No. 193.

Pyrites.—Dr. Alfred W. G. Wilson, in "Pyrites in Canada," (Mines Branch, Department of Mines, Ottawa, No. 167), states that the mineral pyrites is reported from many localities in British Columbia. Of these, two deposits are worthy of special mention, namely, one on a tributary of Eestall river, and the other, the Hidden Creek mine, Observatory inlet, both in Skeena mining division. It was reported last year that a shipment of pyrites was made by the Granby Consolidated Co. from the latter deposit to works in the neighborhood of Vancouver, B.C.

Salt.—A salt deposit, discovered in 1910-11 in a basin on the Kwinitsa river, which flows into the Skeena near the 46th mile-post on the Grand Trunk Pacific railway, is described in the "Annual Report of the Minister of Mines, B.C.," 1913, pp. 85-87.

Scheelite.—The tungsten-bearing mineral, scheelite, occurs at several different places in British Columbia. In Cariboo mining division it is found with tungstite at Hardscrabble creek, and in the placer deposits of Antler, Lowhee, and China Creek claims. In Nelson mining division, West Kootenay, it occurs with tungstite and wolframite at the Kootenay Belle mine, Sheep creek, and at the Granite-Poorman mines, near Nelson city. In Slocan City mining division, also in West Kootenay district, its occurrence has been noted in quartz veins in the Meteor mine, on Springer creek. It is not produced commercially in the province.

Under the subhead "Tungsten," the Report of the Canada Munition Resources Commission includes notes respecting tungsten in British Columbia and Yukon Territory, as follows:

"There have been no important developments since Dr. T. L. Walker's 'Report on the Tungsten Ores of Canada' was published by the Mines Branch, Ottawa, in 1909. The occurrences there described in the Kootenay Belle (Sheep creek), Granite-Poorman (Nelson), and Meteor (Slocan) mines, West Kootenay district, and that on St. Mary's creek, East Kootenay district, were inquired into, and no developments of commercial value seem likely.

"There has been no production from the deposit on Hardscrabble creek, in the Cariboo district, but the property has been further developed and kept open. At the time of Dr. Walker's inspection 'the mine was idle, but from those interested it was learned that a shaft had been sunk about 30 ft. in the rock and drifting along the tungsten zone had been carried about 50 or 60 feet.' The Provincial Mineralogist of British Columbia entered these workings, which are below the creek level, and inspected them as far as conditions would allow, the rock faces showing small veins or veinlets of scheelite. Mr. J. A. McPherson, of the Cariboo-Chisholm Creek Mining Co., Ltd., Van Winkle B.C., writing on November 24, 1916, describes this property and appends a sketch of the workings. He states that the deposit is 11 miles from Barkerville, 50 miles from Quesnel, and six miles from the main Cariboo road. From further examination and analysis since Dr. Walker's inspection he finds 'the zone of payable ore containing about 10 per cent. tungstic acid will be 12 ft. in width; oxidized ore in the new tunnel work

17.9 per cent WO_3 ; general value of the sides of the new tunnel 12.3 per cent WO_3 . The property was put in first-class shape in September, 1915.

"Dr. W. F. Ferrier reported to Mr. J. C. Gwillim the occurrence of wolframite at the head of Mud creek, on Rocher Deboile mountains, near Hazelton, which has been described in the 'Report of the Minister of Mines, British Columbia,' for 1916. It is there stated that the wolframite is distributed through mineralized stringers from 3 in. to 2 ft. 6 in. in width which occur in granite.

"A few hundred pounds of scheelite and wolframite have been shipped from placer workings in the Yukon, and more may be saved during the coming season. The late Dr. Cairnes has presented information on this subject in the 'Summary Report of the Geological Survey' for the year 1916."

Sodalite.—A fine, blue sodalite, which is a silicate of alumina and sodium, and is used in the fine arts and in jewellery, occurs near Ice river, in Golden mining division, Northeast Kootenay.

Tripolite.—Tripolite, or diatomaceous earth, is known to occur in several places in the province. In the "List of Canadian Mineral Occurrences," it is given as occurring in Cariboo, Clinton, New Westminster, and Quesnel mining divisions, and on Vancouver Island. A deposit of unknown size was reported from Queen Charlotte Islands in 1914. A deposit within ten miles of the city of Victoria is briefly described by Mr. Chas. H. Clapp in Geological Survey Memoir 36, "Geology of the Victoria and Saanich Map-Areas, Vancouver Island," pp. 171-172.

Dr. W. F. Ferrier reported to the Canada Munition Resources Commission that "information and samples were obtained of a large deposit of very fine-grained diatomaceous earth, of a pure white color, at Deadman lake in the Kamloops district. Several polishing powders now on the market are composed of a similar material."

Miscellaneous.—In his notes, published in the report of the Canada Munition Resources Commission, Dr. W. F. Ferrier includes the following:

"A mineral which I found to contain strontium was handed to me in the field and is now being analyzed. It was too late in the season to visit the locality.

"A sample of nickel-ore was given to me at Keefer, B.C., but it proved to be chromite. It is said to occur in the country west of Kanaka, on the Fraser river, but I have not yet ascertained the precise locality.

"The report of a discovery of potassium salts in the Nicola Valley, which I was instructed to investigate, proved to be without foundation."

It may be added that several years ago a discovery of tin-bearing ore was reported to have been made in the neighborhood of Fish river, probably in Lardeau mining division, but the locality was not easily accessible, and little has since been heard of it.

Structural Materials and Clay Products.—Three works for the manufacture of Portland cement have been erected and equipped in British Columbia—at Tod inlet, and at Bamberton on the other side of Saanich inlet, both on Vancouver Island, and at East Princeton, Similkameen. Only that at Tod inlet, however, has been a continuous producer on a comparatively large scale.

Clay products comprise an important industry in the neighborhood of Victoria, Vancouver Island, these including chiefly common brick, pottery, drain and sewer pipe, tile, etc. Bricks of various kinds, including ornamental and fire, and fireclay products generally, are made at works in Clayburn district 30 to 40 miles from Vancouver city.

Lime, sand, gravel and other materials are available for all building purposes in various parts of the province. Building stone includes granite, limestone, marble, sandstone, and slate. Marble is found on the west coast of Vancouver Island, on Texada Island, and in the neighborhood of Kootenay lake; from quarries in the last-mentioned district marble has been shipped east to the prairies.

Mineral Water.—The best known mineral springs in the province are those at Harrison lake; Haleyon and Leon, on Arrow lake; Ainsworth, on Kootenay lake, and the Sinclair springs in Northeast Kootenay. Mineral water is shipped from one or two of these springs, but not in very large quantity.

PERSONAL

Mr. A. A. Hassan is in New Brunswick examining manganese and pyrrhotite deposits. He will also make examinations of the Montague gold deposits and the Bradford gold mine in Nova Scotia.

Mr. A. G. Burrows, of the Ontario Bureau of Mines, has returned to Toronto from Northern Ontario.

Mr. C. W. Knight has returned to the Abitibi area which has been surveyed recently.

Mr. Samuel W. Cohen has returned to Montreal after a month's tour of inspection of mining properties in Northern Ontario, Nevada, and Colorado.

The Chicago Pneumatic Tool Co. announce that contract has been let and work started on the erection of an up-to-date addition to their Cleveland Plant, which is planned to double the present output. It is expected that work will be completed on the building itself about November first. The necessary equipment has been ordered and it is believed will be delivered and ready for installation by the time the building is completed, so that the additional production contemplated will be available very soon thereafter.

Dr. M. Y. Williams, who has been recently working in the Glencoe oil field is now at Dutton.

Mr. W. K. McNeil will have charge of the exhibit of the Ontario Bureau of Mines at the National Exhibition, Toronto.

Sir John W. Carson, President of the Crown Reserve Mining Company, Limited, to which company Samuel W. Cohen is Consulting Engineer, recently inspected the Alice property at Idaho Springs.

REFINING GOLD AT OTTAWA MINT.

Ottawa, Aug. 15.—Since the outbreak of war gold coin and gold bullion to the value of \$1,300,000,000 have been received at Ottawa by the Department of Finance as trustees for the Imperial Government and the Bank of England. How the work of the Royal Mint here has, in consequence, been increased is not generally realized. When these deposits of gold were received by the Department of Finance, it was necessary that their value should be ascertained and that a certain quantity of gold bullion should be refined. The heavy demand on the gold refinery at the Mint led to the construction of a second plant with a monthly output of a million ounces of fine gold. Through this extension the refinery has developed the largest capacity of any gold refinery in the world.

The special work of the refinery, due to the war, is shown by the following figures:

Gold bullion received for refining, 15,992,770 ounces.
Total gold bars produced, 14,048,803 ounces fine.
value \$290,414,547.

Fine silver recovered, 1,175,000 ounces fine.

BOOK REVIEWS.

International Mining Law, by Theo. F. Van Wagenen. Price \$3.00. Published by McGraw-Hill Book Co., New York. For sale by Book Department, Canadian Mining Journal, Toronto.

This is an attractive little volume, bound in black leather, of 327 pages and index. The author gives a brief history of mining and mining law in America. Chapters are devoted to ancient mining laws in Germany, Spain, Mexico and Central and South America. Chapters are devoted to the Australian, South African, Canadian and European, as well as to the American system of Mining Law. Digests of mining laws in many countries are given.

The latter part of the book is devoted to chapters headed as follows: The prospector, extralateral rights; discovery of ore as a prerequisite to a valid location; leasehold vs. fee simple title; free prospecting vs. licensed prospecting; prospecting areas; defects and deficiencies of the American law; miscellaneous historical notes; conclusion.

The volume is a very interesting one and should prove of assistance to those who are interested in securing laws favorable to the development of mineral resources.

Mining Engineers' Handbook. Edited by Robert Peele. Price \$5.00. Published by John Wiley & Sons, New York. For sale by Renouf Publishing Co., Montreal.

This is a volume of 2,307 pages and index. The large number of subjects dealt with is shown by the fact that the index occupies 66 pages. The volume is attractively bound in red leather.

Besides the sections dealing with mineralogy, ore deposits, methods of prospecting, exploration and mining, and mining plant of all kinds, there are others, on certain branches of civil, electrical and mechanical engineering. Mr. Peele has recognized that the mining engineer in equipping and operating mines has to deal with many branches of engineering and he has, therefore, included data that would otherwise be unnecessary. A large number of specialists have contributed sections.

The 44 sections of the book are headed: Mineralogy, by A. J. Moses; Geology and Mineral Deposits by J. F. Kemp; Earth Excavation, by H. P. Gillette; Explosives, by H. G. Haskell, F. B. Holmes, A. La Motte, and F. J. Le Maistre; Rock Excavation, by H. P. Gillette; Tunneling, by D. W. Brunton and J. A. Davis; Shaft Sinking in Rock, by H. L. Carr; Shaft Sinking in Soft, Water Bearing Soils, by F. Donaldson; Boring by A. F. Taggart; Prospecting, Development and Exploitation of Mineral Deposits, by Jas. F. McClelland; Underground Transport, by E. C. Holden; Hoisting Plant, Shaft Pockets, and Ore Bins, by Wm. M. Weigel; Drainage of Mines, by R. Van A. Noriss; Mine Ventilation, by F. E. Brackett; Compressed Air Plant, by R. T. Dana; Electric Power for Mine Service, by G. R. Wood; Surveying, by C. B. Breed; Underground Surveying, by E. K. Judd; Mine Geologic Maps and Models, by R. H. Sales; Mine Organization and Accounts, by J. R. Finlay; Cost of Mining, by J. R. Finlay; Wages and Welfare, by E. K. Judd; Mine Air, Hygiene, Explosions and Accidents, by Geo. S. Rice; Mining Laws, by H. V. Winchell; Mine Examinations, Valuations, and Reports, by Wm. Y. Westervelt;

Aerial Tramways and Cableways, by E. B. Durham; Mechanical Conveyers, by L. De G. Moss; Ore Dressing, by R. H. Richards; Ore Sampling, by T. R. Woodbridge; Assaying, by E. J. Hall; Testing of Ores, by J. E. Clenell; Notes on Selling, Purchasing and Treatment of Ores, by A. L. Walker; Gold Amalgamation and Cyanidation, by E. L. Dufourey; Preparation and Storage of Anthracite Coal, by Paul Sterling; Preparation and Coking of Bituminous Coal, by H. McKeen Conner; Mathematics and Mechanics, by C. H. Burnside; Chemical Notes and Tables; Elements of Hydraulics, by J. K. Finch; Engineering Thermodynamics by E. D. Thurston; Steam Engines, Boilers, Pumps, Turbines, Gas Engines, by H. L. Parr, E. D. Thurston, Jr., and A. L. Herrick; Mechanical Engineering Miscellany, by C. W. Thomas and H. L. Parr; Electrical Engineering, by W. I. Shickler; Elements of Structural Design, by J. K. Finch; Engineers' Tables.

The list of subjects dealt with and the names of the well known authorities who have contributed will be sufficient to interest any mining engineer in this volume. It contains a wealth of information in concise form and will doubtless be soon generally recognized as a very important contribution to mining literature. Metal miners will especially welcome it.

CHROMITE.*

By J. S. Diller.

Chromium is one of the important war metals, being extensively used as an alloy to harden steel in the manufacture of munitions.

About a dozen minerals contain chromium, but chromite, often called chrome ore or chromic iron ore, is the only mineral of commercial importance as a source of chromium. Its theoretical composition is represented by the chemical formula $\text{FeO} \cdot \text{Cr}_2\text{O}_3$, according to which it contains 68 per cent Cr_2O_3 (chromic oxide) and 32 per cent FeO (ferrous oxide). In nature, however, more or less of the chromium is replaced by aluminum or iron, so that the percentage of chromic oxide varies with the degree of replacement from more than 60 per cent down to less than 10 per cent. The value of chromite depends on the content of chromic oxide, and the price of any grade of ore is based on the percentage of chromic oxide that the ore contains. High-grade domestic ore contains 40 per cent, or more of chromic oxide. Much of the domestic chromite is of low grade, although the greater portion of it is reported to be of high grade.

The principal present applications of chromite are for metallurgic use in the manufacture of ferrochrome to make munitions of war and for furnace lining in the form of crude ore or chrome brick. Several special steels, as automobile steel and airplane steel, contain chromium, but not all of them are of special importance in the war program.

The principal chemical uses of chromite are in the manufacture of bichromate of soda, bichromate of potash, chromic acid, and chrome alum, which are employed in the manufacture of dyes and pigments and for tanning leather.

For both metallurgic and chemical uses high-grade ores are much desired. Low-grade ores can be used to greater advantage in making the alloy ferrochrome than in making chemicals. This adaptability in the manufacture of ferrochrome renders it possible greatly to extend the production and utilization of the low-grade domestic ores.

* Extracts from a report published by the U.S. Geological Survey.

To discover, if possible, the causes of decline in the production of chromite in 1917, the United States Geological Survey sent out a questionnaire to all the chrome producers on its list, asking for statements of the maximum possible production of the mine during the last quarter of 1917 and the actual shipments of chromite from the mine during the same period, the difference being the deficiency in production due to one or more causes, of which the following may be noted: Bad weather, poor roads in winter, lack of funds, lack of shipping facilities, especially lack of cars as the result of the freight embargo, low prices, and uncertainty of market, particularly for low-grade ore. The last two are the most potent causes affecting small producers.

HOISTS, BUCKETS, CARS

MINE HOISTS, made in 7 sizes, from 10 to 50 horse power and with any diameter of drum up to 48 inches at bottom of flanges.

MINE BUCKETS, made any size, shape, or style, to suit the customer.

MINE CARS, made in a large variety of sizes and styles to suit the particular work for which they are intended.

MINE CAGES, with safety devices, made to order, to fit the customer's shaft.

MINE SKIPS, self-dumping and self-righting, made in a variety of sizes and styles.

Our large catalog describing all of above is yours for the asking.

Marsh Engineering Works, Limited, Belleville, Ontario

Established 1846

IN THESE DAYS OF RACING WITH TIME

When labor is a most vital item, when risks are increased as production records are broken, good light for the miner is absolutely necessary.

Good lighting speeds production and does it safely. Men work more quickly with a light that burns steadily, and if it operates without attention it not only saves time, but guards against accidents.

You get the utmost from labor, if you use the ITP, as it is the supreme carbide lamp achievement of recent years.

"We are trying to make that 'Trade Mark' the standard for carbide lamps."

"During the last few years these lamps have been gaining in favor and now they promise to eclipse all others."

FOR SALE

IMMEDIATE DELIVERY

- 4—300 H.P.—200 lbs. pressure water tube "Atlas" Canada Foundry boilers.
- 4—201 H.P.—160 lbs. Babcock & Wilcox water tube boilers,
- 5—Boiler feed pumps.
- 1—Feed water treating tank.
- 1—Wainwright feed water heater.
- 3—Jet Condensers.
- 1—1,000 H.P.—98 R.P.M.—24 inch x 36 inch x 46 inch Inglis Vertical Cross Compound Condensing Engine
- 1—Canada Foundry Triplex Pump, motor driven, 300 gallons per minute, cylinders 8 inch x 12 inch.
- 2—150 K.W.—250 volt, D.C. Generators direct connected to Peerless Self-oiling automatic engines, 125 lbs. working pressure, 230 R.P.M.
- 2—400 K.W.—250 volt, 300 R.P.M., Beited Compound D.C. Generators, C.G.E.
- 4—200 K.W., 360 R.P.M., single phase, 60 cycle, 2,200 volt C.G.E., A.C. Generators
- Quantity of 52-inch belting, idlers, and various boiler and engine room accessories.
- Piping, Valves, Fittings, etc.
- 180—Type H, C.G.E., 2200/220/110-60 cycle line transformers, sizes 1 K.W. to 15 K.W.
- 2,000 Poles in various lengths, 60 ft. to 20 ft., cross-arms, brackets, insulators, etc.
- Quantity of No. 6 Weatherproof wire.
- 1,500—Watthour Meters, 110/220 volt, 60 cycle, and 250 volt D.C. Ferranti and C.G.E. Various sizes from 5 amp. to 150 amp.
- 10—D.C. motors, 500 Volt, 1 H.P. to 20 H.P.
- Miscellaneous lot of general equipment used in connection with the generation, distribution and sale of electric power.

WANTED—

Copper Refiner, to take charge of copper cathode melting plant, casting various shapes, including wire bars. A practical furnaceman, who knows from years of actual experience how to fuse in a bottom, how to train a crew of "green" men, and can himself produce marketable copper, can secure a steady position, and a satisfactory salary, with a responsible smelting company. Apply Box N Canadian Mining Journal.

FOR SALE

ONE DOUBLE SET OF TOOTHED ROLLS, 22 in. diam., 20 in. face. Suitable for reducing any soft material. Complete with drive pulleys, spare shells, gears, springs, etc.

ONE SET PLAIN ROLLS, 23 in. diam., 12 in. face. Suitable for any fine reducing. Complete with drive pulleys, and one set of spare roller shells.

Both machines are as good as new, having run only four months, and are open to inspection.

Will consider any offer. Write for further particulars.

BUCKINGHAM, P.Q.

FOR SALE—

One Litchfield Hoisting Engine, 18 in. cylinder, 32 in. stroke. Two 5 ft. drums with 4 ft. face and grooved for 1 in. rope. In excellent condition. One "WC" Sullivan tandem Air Compressor. Compound steam and two stage air cylinders. Corliss Valve Gear. Capacity 1,800 cu. ft. to 100 lbs. pressure per minute. For full information and price, address:

THE TEMISKAMING MINING CO., LTD.
COBALT, ONT.

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium, petroleum, platinum, quartz, salt and tale.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth \$72,093,832, of which the metallic production was \$56,831,857.

Dividends and bonuses paid to the end of 1917 amounted to \$11,486,167.45 for gold mining companies, and \$70,821,829.34 for silver mining companies, or a total of \$82,307,996.79.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

Insure Against Shut-Downs

To keep the coal moving, always with a maximum tonnage at the tippie, calls for an efficient, practical method of overcoming forced lay-ups when machinery breaks. Waste and lost profits result from old-fashioned, time-consuming methods for repairing metal parts.

The "preparedness" way is to rely on an Imperial Oxy-Acetylene Outfit. No need to wait days for a replacement of parts. An Imperial, in the hands of your

IMPERIAL WELDING CUTTING EQUIPMENT

CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO

No. 18

THERE IT IS!

And we absolutely guarantee that
it is impossible to manufacture

A BETTER BABBITT

than

Imperial Genuine

for

Mining Machinery Bearings

and for high-speed heavy engines and extraordinary hard work.

In actual test we have found that under a load of 300 to 1,200 pounds to the square inch the rise in temperature was scarcely perceptible.

The tenacity of the tin and copper mixture combined with ductility renders it best for high speed work and where special service is demanded.

Harris Heavy Pressure

for

General Machinery Bearings

is

The Most Popular Babbitt

in

the Dominion

It will give excellent service

Order a box from our nearest factory

Our Guarantee Is Back of Every Pound of Babbitt Metal We Make

The Canada Metal Co. Limited

TORONTO — HAMILTON — MONTREAL — WINNIPEG — VANCOUVER

CORE DRILLING ACCURACY

The secret of successful drill prospecting is **ACCURACY**. Inaccurate records, by misleading, may cause great waste of money and time in useless development.

SULLIVAN DIAMOND DRILLS

and **SULLIVAN DRILLING SERVICE**

have a high standing for accuracy and reliability, attained by 43 years of drill manufacture, and by 35 years of contract core drilling work in all parts of North America and in many foreign countries.

Sullivan Double Tube Core Barrels

illustrated by this sketch, represent the highest accuracy in prospecting for coal or in other soft or broken formations. The core, two inches in diameter, is protected from vibration by the stationary inner chamber. The wash water passes **outside** of this tube, so that it has no chance to eat the core away. The outer barrel revolves, with the diamond bit, to perform the cutting. When full of core, the barrel is lifted out, keeping the section of coal or other friable rock or mineral intact.

Write for prices on Accurate Core Drilling.
Sullivan Service is cheapest in the long run.

Conserve Your Man Power and Reduce Operating Expenses

The first is absolutely necessary from a patriotic standpoint—the second is the first thought of every successful business man. Both can be accomplished when you install the “New Cleveland” Stoper in your mine. It has speed, with staying power and efficiency, double that of any other drill on the market. It has lower operating expenses, because of its low air consumption, and its economy in repairs, through its drop forged parts of simple design which are practically unbreakable.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

IMPERIAL WELDING AND CUTTING EQUIPMENT OXY ACETYLENE PROCESS

**Avoid Shut-Down or Delay
When Emergencies Arise**

The tool equipment of every mine is incomplete
without an Imperial Welding Outfit. Within a few
hours after the most serious break, metal parts
will be inseparably joined and work continued, as
a result of its use. First in Economy, Efficiency
and Safety, the initial cost of an Imperial Equip-
ment is often repaid in a single operation.

PRINTING AND PUBLISHING

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing and distributing Annual Statements, Special Reports, Descriptive Pamphlets, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction.

We shall be glad to furnish estimates to enquirers.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping. Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167 603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$74,620,103; Lode Gold, \$91,350,784; Silver, \$41,358,012; Lead, \$36,415,124; Copper, 114,559,364; Other Metals (Zinc, Iron, etc.), \$7,730,178; Coal and Coke, \$165,829,315; Building Stone, Brick, Cement, etc., \$26,697,835; making its Mineral Production to the end of 1916 show an

Aggregate Value of \$558,560,715

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462.

Production During last ten years, \$284,916,993

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

If you wanted to smash rocks, would you first cushion them with water?

Would you break the force of your sledge by splashing it to the bottom of a pool a foot or two in depth?

No, you would not. You would leave those rocks exposed to the full strength of your good right arm.

Now take ore, put it in a mill and hammer it with steel balls. Why should you cushion ore with a lot of water and thus retard the striking and grinding force of the balls, **when you don't have to do it?**

In nearly all types of mills you must drown the ore in order to overflow the fines.

But **not** in the MARCY BALL MILL. It has a dis-

charge end (patented) which is virtually one enormous grate, or grid, from the periphery of the mill to near its centre.

So little water is needed to clear the fines through this generous grate area as fast as they are ground that the heavy steel balls go smash-bang right onto the ore.

There's no large volume of water or mass of trapped fines to hinder production on the MARCY.

In this you see one of the reasons why the mesh ton capacity of the MARCY MILL is so enormously great, and why it is being adopted by important mining companies.

Section of ordinary wet-crushing mill in operation. Note amount of water required to overflow the fines.

MARCY BALL MILL

"One Easy Step"

Section of Marcy Mill in operation. Note low water line. Fines are rapidly ejected, thus keeping mill clear.

KLIM
IN POWDER FORM

Fresh and Sweet to the Last Bit

Klim is economical in camp and boarding house, because it costs less than liquid and is more economical, because there is no waste. Use from the tin as needed, mix dry with sugar, flour, etc., or whip into water for use as liquid.

Klim is pasteurized separated milk in powder form. It will not sour or spoil. The last bit will be as sweet and fresh as the first from the tin. Can be safely shipped any distance at any time of year. Get Klim in 10-lb. tins from your supply house.

Klim is genuine—the flavor proves it.

There has just been published the report of the Department of Mines, of Quebec, on mining operations during 1917. A preliminary report by Mr. Denis, published in March, gave a summary of the production during 1917. The report includes information on asbestos, copper and sulphur ores, iron, chromite, zinc, lead, molybdenite, gold, silver, magnesia, mica, kaolin, antimony, graphite, mineral paints, building materials, silica, peat and coal. Particularly interesting and useful are the accounts of development of "war minerals." Quebec has important deposits of chromite, molybdenite, magnesite and pyrites, and these deposits are being worked very successfully, and Quebec is making an important contribution of minerals for munitions.

The Department of Mines has just published two reports that will be of special interest to those engaged in developing mineral resources of Northern Manitoba. Memoir 105; The Amisk-Athapapuskow Lake District, by E. L. Bruce, and the Summary Report, 1917, Part D, by E. L. Bruce, F. J. Alcock, J. R. Marshall and W. A. Johnston, are full of information on the mineral resources of Manitoba.

THE ADVISORY COUNCIL'S REPORT.

There has recently been much talk over proposals to establish in Canada, institutes like the Mellon Institute of Pittsburgh and the Bureau of Standards, Washington. There can be no doubt that these institutes are doing very valuable work in the United States and that we should have had similar ones here years ago.

Approval of the proposal to establish a central research institute in Canada is contained in the report of the Advisory Council for Scientific and Industrial Research just published. According to the press despatch which contains this announcement, the Advisory Council has discussed the matter at great length for the last nine months and the chairman has, on several occasions, consulted collectively and individually the heads of the various technical bureaux in Washington on the subject and a majority of the members of the Council visited Washington to discuss the matter.

Apparently the Advisory Council has profited by its own preaching. When first appointed, some of the members took great delight in talking about subjects of which they obviously knew little. If they had had the good sense to consult the technical heads of Canadian bureaux, as they have since done, those of Washington, they would probably not have been so careless in their statements. Fortunately, they were correct in their main argument: that Canada will benefit by paying more attention to the application of research to industry. They have themselves demonstrated that research is good for Advisory Councils.

The Advisory Council has important work to do and it has the assistance of men who can do good work. If the Council has the ability to use to any appreciable extent the volunteer service that is represented on its various advisory committees, it should be an important factor in industrial development. While we have not been able to give the Advisory Council any great praise for its statements concerning industrial research in Canada, we still have hopes that it may eventually fill the place it occupies. If it can carry on a successful campaign for the establishment in Canada of research bureaux it will deserve our thanks, particularly if it can do so without spreading misinformation concerning the mining and metallurgical industries.

The Advisory Council, if we may judge from the publicity given to the subject, evidently considers its most important accomplishment to be the exploitation of the lignite deposits of Saskatchewan. On the advice of the Council, the Dominion Government and the Governments of Manitoba and Saskatchewan are spending a large sum of money on an experimental briquetting plant at Estevan, Manitoba. If this plant proves to be a commercial success the Council, together with the Commission of Conservation which has advocated the

briquetting of the lignites, and the Department of Mines, which did most of the experimental work, some of it years ago, will have been of great help in providing local fuel for the Prairie Provinces.

An objectionable feature of the publicity in connection with this experiment has been the failure to give proper consideration to the coals of western Alberta. Judging by newspaper comments, the continual comparing of lignite of Saskatchewan with coals from the Eastern United States has led the public to believe that there is not in Western Canada any satisfactory substitute for the American coals now imported. It cannot be too often emphasized that the main reason that so little of the high grade coal of Alberta has been sold in Manitoba is that the railways charge a much higher freight rate on Canadian coal coming east than on American coal going west. The preference given to American coal by the railways is a natural result of the heavy movement of grain to the east, and it may be that the rate is a reasonable one. The matter of freight rates needs investigation. Any proposal to substitute Canadian coal for American coal in Manitoba should include careful consideration of the fact that there is plenty of good coal in Alberta. We are not satisfied that Alberta coal is being properly utilized in the Prairie Provinces.

The lignites of Saskatchewan may be utilized to better advantage than at present by carbonizing and briquetting them, as will be done at Estevan; but it will be regrettable if the Government considers that this experimental work on briquetting lignites relieves it from the necessity of inquiring into the reasons why our better grade fuels are not utilized.

The Advisory Council has also interested itself in certain investigations into the use of tar fog and some time ago engaged the services of a gentleman who has been making special researches. Important results are said to have been obtained. This may prove to be an important contribution to our coal distillation and metallurgical industries.

Investigations which may prove of value to industries other than mining include: utilization of heat and light from waste straw; fog signalling; sulphite liquor waste; rust-resisting wheat, etc.

Of interest to all industries are the activities of the Council towards providing better facilities for, and greater interest in, industrial and scientific research. The chairman, Dr. A. B. Macallum, says:

"This question is one of paramount importance to Canada in view of the intensified application of science to industry which elsewhere will be fostered after the war by the State and also through private enterprise. It has been ascertained that not two per cent. of Canadian industrial concerns have research laboratories, and only about ten per cent. have routing laboratories, chiefly for the elementary testing of materials.

"The provision for research, either in pure science or in science applied to industry, has been and is utterly inadequate to our needs, and unless vigorous action be taken, and soon, to re-organize our industries on scien-

tific lines wherever possible, Canada will face a very serious industrial crisis in the years following the war. The annual budget of the Massachusetts Institute of Technology exceeds the total of the annual expenditure of all the Faculties of Applied Science in Canada."

In connection with the proposal to establish a Central Research Institute, Dr. Macallum says:

"The work of the proposed institute would powerfully aid the development of scientific industrial research in Canada by stimulating the Canadian universities to increase their resources and facilities for research and thereby to direct into the ranks of science the ablest of their young graduates desirous of qualifying for a career, whether in pure science or in science applied to Canadian industry. It would place at the service of Canadian industry a factor which would insure its success in the strenuous international trade competition which is near at hand. It would, above all, enable the nation to direct its energy towards the economic and right utilization of its untouched stores of national wealth, in order that it may bear, with some degree of ease, in this and the next generation, the almost Atlantean financial burden it is assuming as a result of its playing its part in the present world struggle."

This statement of the work of the proposed institute should attract the attention of men in all our industries. Such an institute would undoubtedly be of great value to the mining and metallurgical industries of this country, and those engaged in these industries will do well to interest themselves in the proposals of the Advisory Council. We have not yet seen a copy of the complete report; but we understand that it is proposed to have, in connection with the Institute, laboratories at the disposal of associations which may be founded by the various industries, so that there may be co-operation in investigating problems that individual companies do not feel justified in tackling. Such laboratories would undoubtedly be an assistance in solving some of our problems.

From the report of the Advisory Council, we judge that it is recognized that we need researchers even more than we need laboratories and institutes. This is undoubtedly true. May we, however, be allowed to suggest that our industries are not yet using to advantage the research material that is available. There have been more embryo researchers turned out by Canadian institutions than have been absorbed by Canadian industries. The reason is obvious; the opportunities of making a decent living by scientific work in Canada have been too few. Our Government and our industries have now in their employ more highly qualified scientific men than they deserve to have. Inadequate salaries for scientific work are the rule in this country, and the consequence is that many, though, fortunately, not so many as might be expected, scientifically trained men go into other work or to other countries. In granting inadequate salaries to scientifically trained men, our Governments lead the way. Is it to be wondered at that researchers are scarce in this country, when we

find the Civil Service Commission advertising, as it did recently, for a scientifically trained man for the Mines Department at a salary of \$1,600 per year? Are the policies of the Government as exemplified by the Civil Service Commission and the Advisory Council in harmony? Is a Government that is unwilling to pay adequate salaries to technical men justified in encouraging young men to spend years and money in acquiring advanced technical education, if they intend to live and work in Canada?

VIEWS ON ORIENTAL LABOR FOR COAL MINES.

In official, political and Labor circles throughout British Columbia, the recent declaration of Hon. Frank Carvell, Canadian Minister of Public Works, that Asiatic labor must be imported for Canadian coal mines, if the fuel required for the absolute necessities of Canada cannot otherwise be produced, has occasioned much comment. The suggestion that Orientals should be given access to Western Canada without restriction meets with general opposition and any step having in view their employment in mines in larger numbers than at present would meet with vigorous opposition, not only on the part of the miners' unions, but by every branch of organized labor. The Press also opposes the idea, with the single qualification that it might be forced by famine. One of the leading journals of the province refers to the matter in the following terms:—

"The Minister of Public Works may not understand all the objections to the policy he proposes. His conditional plan would find the strongest opposition in the province which is best acquainted with Oriental problems. Nevertheless the statement of Mr. Carvell will have strong support among the people, if they find a coal famine upon them. Fuel must be provided, and in the last emergency the Government would undoubtedly call on Asia or any other country for help. But the last emergency has not yet arrived and it should not be too late to avert it by other means."

THE SEARCH FOR PLATINUM IN BRITISH COLUMBIA.

Mr. G. C. Mackenzie, of the Canadian Department of Mines, has made an interesting statement of the work under way in British Columbia in the line of prospecting for and developing minerals urgently needed by the Munition Resources Commission of Canada for war purposes.

The opening up of platinum ground was first undertaken. Mr. Mackenzie took a light prospecting outfit into the Tulameen River district, this consisting chiefly of three Empire drills. While no holes have been driven as yet, some gravel has been washed and it has been established that platinum can be obtained. The party traveled up and down the river, visiting many claims being operated by individuals, all of whom were taking out platinum and gold and all of whom appeared to be making wages. Promises were secured in every instance that clean-ups from these claims would be taken either to the Bank of Montreal or the Bank of Commerce at Princeton, B.C., whence the mineral will be forwarded to the Dominion Assay Office, Vancouver, B.C. for treatment.

Mr. Mackenzie says, in this connection, that the refinery for the handling of platinum and gold, which is being installed at the Vancouver Assay Office, is about complete and that it will be prepared to take all the

platinum, with or without gold, that may be offered, paying the market price for the latter and \$105 an ounce for the former. The prices offered for paladium, iridium and osmiridium have not yet been decided, but quotations have been cabled for and will be known in a short time.

On behalf of the Dominion Government, Mr. Tomlinson is touring British Columbia, at present being in the Kootenay districts. He is sampling all ground reported to contain platinum and, in brief, carrying out a thorough investigation in order that no other real source of supply may be overlooked.

Rich Molybdenite Ore From Taylor Mine.

Some time ago there was shipped from the Taylor molybdenite mine, near Renfrew, what is perhaps the richest car of molybdenite ore ever treated in Canada. Sampling and concentration results on this shipment show that it averaged over 6 per cent. MoS_2 . According to Mr. Taylor, who owns and operates the mine, only a small part of the shipment was hand-picked ore.

The market for molybdenite has recently been poor, as the United States dealers have not shown any anxiety to obtain supplies. Most of the molybdenite produced in North America is manufactured into ferro-molybdenum in the United States and exported to Europe.

The detailed report on the sampling and concentration of the carload of Taylor mine ore recently treated at Ottawa, show that it contained 141.5 lb. flake, containing 89.2% MoS_2 , and 49,937 lb. ore and fines containing 6% MoS_2 , or a total of 3,122.4 lb. MoS_2 . The recovery was 92%, or 2,872.65 lb. MoS_2 .

DEVELOPING COPPER MOUNTAIN.

The Canada Copper Corporation is making very satisfactory progress in the development of its immense deposits of low-grade copper at Copper Mountain, and should be in a position to commence production on a large scale at an early date. It is estimated that before work starts in the actual taking out of ore, the company will have expended \$3,000,000. Miles of road for the use of wagons and automobile trucks have been built to the mill site, situated four miles from Princeton, B.C., and a saw-mill, capable of cutting between 16,000 and 18,000 feet a day has been installed. Some excavating has been done for foundations to sustain the concentrating plant, capacity 2,000 tons daily, and some of the timber that will enter into its construction has been prepared. The company has been engaged in the opening up of its Copper Mountain properties for seven or eight years.

DIRECTOR OF COAL OPERATIONS.

Ottawa, Sept. 13.—Charles A. Magrath, Fuel Controller, has been appointed Director of Coal Operations for Nova Scotia and New Brunswick. The powers given him are wide. He has power to make all necessary investigation and enquiries respecting wages, holidays, hours of labor, the utilization of labor to the best advantage, and respecting all other matters necessary to, and connected with, the cost of and production of coal and "the increase and continuance of such production in Nova Scotia and New Brunswick during the present war and for three months after the end of the war."

The Manufacture of Silica Brick*

By H. Le Chatelier and B. Bogitch

Silica brick are indispensable in the manufacture of steel because they alone are able to withstand the high temperature of regenerative furnaces. All attempts to replace silica brick by other refractory materials for this purpose have failed.

Before the war, silica brick employed in France came principally from abroad, for which reason, since the beginning of hostilities, certain French steel works have been seriously handicapped. Our attention was first directed to the question by Mr. Bied, Engineer of the Teil Works. With him, we began certain investigations, at first using our laboratory and the furnaces of neighboring steel works. The larger part of our experiments, however, have been made in the laboratory of the Faculty of Sciences at Sorbonne. For the heating of our samples, we are deeply obliged to MM. Charpy, Yeatmann and Guérineau. In undertaking these studies, our first aim has been to render assistance to French industry, by indicating, as precisely as possible, the necessary conditions for the manufacture of high-grade brick but at the same time we have intended to give an example of the manner in which scientific methods may be put to practical application in the solution of industrial problems. Although our work has been confined to samples of only a few grams, we are nevertheless convinced that our information can be directly utilized by brick works of which the output is measured in thousands of tons.

As to what are most important and necessary qualities of silica brick, if one were to ask the steel metallurgists, they would almost unanimously reply that there was only one, namely, that the brick should permit the greatest possible number of runs without necessity for repairing the furnace roofs; they might suggest 400 runs as a satisfactory figure. Durability, however, is not the only factor. The brick have to be transported from the factory to the steel works without being injured by the jar or by freezing; many otherwise satisfactory bricks will not satisfy this last condition. It is further necessary that the brick shall not be too expensive, in order not to add unnecessarily to the price of the manufactured steel. The fundamental requirements, therefore, are the following: (1) durability of the furnace; (2) durability in transport; (3) moderate price.

Considering first the subject of durability of furnaces, the processes by which furnace roofs are destroyed can be answered by the direct observation of those in charge of furnaces. Our inquiries along this line did not meet with great success; only two steel works, the Ruelle Foundry, and the Chaussade Works, have been able to give us precise information, but, unfortunately, contradictory. One of these works has assured us that the roofs of Martin furnaces are almost invariably destroyed by progressive decrepitation under the action of heat. The other works, on the contrary, has assured us that similar furnaces are destroyed almost exclusively by melting. The brick manufacturers, on the other hand, have given us still a third reason, the ignorance or negligence of those in charge of the construction and operation of the furnaces. The engineer may have designed the profile of the furnace badly, not placing his burners in the most desirable place, or applying the first heat of the furnace too abruptly. The builder may have erred in shaping his bricks care-

lessly and laying them irregularly, so as to produce local pressure sufficient to occasion rupture. Above all, the heat may melt the roof of the best furnace, sometimes in a few hours, if the gas is badly regulated or if the reversals of flame are at too long intervals. From the discussion of this contradictory information and from suggestions found in different foreign publications, we have arrived at the provisional conclusion that the destruction of the roofs of steel furnaces may arise from five possible different causes, ranking in the following order of diminishing importance:

Causes of Failure of Furnace Roofs.

1. Superficial spalling of the brick under the influence of the highest temperatures developed in the furnace. This phenomenon is often noticed in the form of a continuous rain of little fragments, the falling of which may, after a few days, lead to the entire disappearance of the brick. This phenomenon depends upon two properties of the brick: Expansion of silica under high temperatures, and lack of mechanical strength at high temperature.

2. Superficial melting of the brick. Brick always melts superficially and continuously under the action of the spattering slag; this normal destruction of brick may continue for several months before leading to an actual cavity in the roof. Often, however, the brick will melt at once for a considerable width, several centimetres at a time, by which means the normal destruction of the brick may be multiplied by ten or more. This phenomenon depends upon the fusibility of the brick itself and upon its permeability, which facilitates the absorption of slag.

3. Flaking or shelling of the brick in the less intensely heated region. This begins to occur during the warming of the masonry, and below red temperature, and continues in the more remote parts after the furnace as a whole is considerably hotter. The brick, thus fractured, may then become detached and fall from the roof. This phenomenon is caused by the excessive dilation which is shown by all crystalline silicas at their temperatures of reversible transformation. Quartzose rocks decrepitate at a temperature of about 570 deg.; cristobalite, around 230 deg., undergoes an abrupt change in dimensions, of very important character; tridymite, finally, at about 150 deg. undergoes a change of slight importance. This tendency to rupture is offset by mechanical resistance of the brick and by its structure, that is to say, by the size of its grain and its amount of porosity.

4. Dislocation of the roof by excessive expansion. In furnaces made of silica brick, the roof always rises more or less when the furnace is first put into operation; this rising often becomes excessive and very irregular from point to point, which then leads to the falling in of the roof. This dislocation results, the same as spalling, from expansion of silica. If the brick is sufficiently resistant, and is heated over a considerable width all at once, it does not spall, but causes the roof to rise.

5. Collapse of the roof. The frequency of this accident with clay, magnesia, and alumina brick, makes it impossible to use these materials for the construction of the roofs of furnaces intended to maintain very high temperatures. Collapse will also occur, but very rarely, in furnaces made of silica brick. Collapsing results

from the softening that precedes fusion and, therefore, depends upon the same factors as fusibility. It is very rare in silica brick, being counterbalanced by the expansion of the quartz resulting from its transformation into silica of low density.

The reasons for the destruction of furnace roofs, and the properties of the brick upon which these depend, can now be tabulated as follows:—

Causes of Destruction.

1. Spalling.
2. Fusion.
3. Flaking or shelling.
4. Dislocation of the roof.
5. Collapse.

Properties of Brick.

1. Fusibility.
2. Compressive strength at high temperatures.
3. Permeability.
4. Expansion.
5. Dilation.
6. Compressive strength at ordinary temperatures.

It would be hazardous to assert that this list is absolutely complete, but if any phenomenon has been omitted, it is for the engineers of steel works to inform us.

Quartz is the universal raw material for the manufacture of silica brick. Deposits of quartz can be grouped into four distinct classes: Quartz veins, quartzite, sandstone and sand.

Most factories employ quartzite containing not more than 3 per cent. of basic oxides, and mix with it 2 per cent. of lime. The crushing of the rock is conducted in such manner as to preserve a number of large grains, having a maximum size of between 5 and 10 mm. The firing is performed at a high temperature, much above that employed in the manufacture of clay brick, and is maintained for a much longer period. This temperature may vary from 1,350 deg. to 1,450 deg., according to the nature of the quartz and the ease of its transformation. Firing progressively reduces the density of the silica; quartz transforms first into cristobalite and finally into tridymite, as one of us has shown 25 years ago. These are the basic facts upon which our researches were conducted.

Why Silica Brick Retains Rigidity at High Temperatures.

Before attacking the problem of the manufacture of silica brick, we have sought to answer an allied problem: Is it possible to find certain measurable properties of refractory products which will explain the superiority of silica over clay, alumina, and magnesia? An exact knowledge of the reason for the superiority of silica brick would certainly be a valuable guide to determine what properties are the most important to develop in the manufacture of refractory materials.

From our experiments, it is apparent that at 1,600 deg., which is still 100 deg. below the temperature of the Siemens-Martin furnace, silica brick has a compressive strength very much higher than that of the other refractory products. Furthermore, a factor which is of no less importance, the silica brick broke abruptly at all temperatures; they did not register any progressive deformation before rupture. With clay and magnesia brick, on the other hand, the observations were entirely different.

This ability of silica brick to preserve their rigidity at the very highest temperatures explains their superiority for furnace manufacture. As a means of reducing

this factor to its simplest terms, we began with an examination, under polarized light, of thin sections cut from bricks of good quality, one marked "American Star" and the other marked "Imphy," these being the two bricks which showed the highest compressive resistance at 1,600 deg., namely 30 and 40 kg. per sq. cm. They were composed of large, easily-recognizable grains of the original siliceous rock, completely transformed into cristobalite and surrounded by a magma formed of little, elongated crystals of tridymite.

The rigidity of the brick was evidently due to the crystallization of tridymite, which forms a continuous network, in the meshes of which the fusible silicates are lodged. The presence of these latter materials does not detract from the solidity of the mass any more than water in the cells of pumice stone would diminish its strength; in both cases, the solid network is unbroken.

In magnesia brick, on the contrary, and also in clay brick, at least in those manufactured under ordinary conditions, this recrystallization does not occur. The slightly fusible material, magnesia, forms isolated grains which are surrounded, at ordinary temperatures, by a magma of very solid silicates; the latter, however, melt at around 1,300 deg., if ferruginous, or at about 1,500 deg., if purely magnesian. Above these temperatures, therefore, the solid grains swim in a melted mass and can slide on one another, the more fluid the magma, the more readily they slide.

The formation of this continuous network of silica is exactly parallel to the phenomenon observed in the hardening of cement. A mixture originally consisting of isolated grains, when tempered with water, is progressively transformed by chemical reaction into a coherent mass. In the same manner, the isolated grains of quartz in a brick become set on contact with melted silicates, which operate as solvent.

Quartz is unstable at temperatures above 800 deg., but, owing to its remarkable passive resistance, it is able to remain for a long time in that condition at very high temperatures, even up to 1,600 deg. If it is then brought into contact with a solvent, melted silicates, for example, it dissolves in that with a readiness very much greater than that of the more stable forms of silica, cristobalite and tridymite. This is due to the unanswerable and thoroughly established laws of physical chemistry. The quartz thus gives rise to super-saturated solution, from which one of the more stable varieties soon begins to crystallize. The melted mass, now being no longer saturated with respect to quartz, is able to dissolve additional quantities of it. Gradually, therefore, the entire amount of quartz recrystallizes into the variety that is most stable at high temperatures, tridymite. In practice, if the firing of silica brick has not been sufficiently long, the proportion of cristobalite, and sometimes even of quartz, is greater than that of tridymite in the finished product, if of poor grade. Burning for almost a month at the highest temperature of the steel furnace is necessary to transform silica completely into tridymite. The crystals of tridymite thus formed by solution attach themselves to one another, as is always the case under similar conditions, and form the network above mentioned.

Quality of the Brick.

This explanation for the superiority of silica brick gave rise to the question whether variations in quality were not exactly parallel to the compressive strength at high temperatures. To settle this question, we re-

quested, from different steel works, samples of brick which had been used for the construction of furnaces, as to the relative quality of which they were able to advise us. The Ruelle and the Guerigny Works sent us well classified series of samples upon which we made tests giving the results shown in Table 3. The tests on compressive strength at high temperatures were made, with some samples as soon as 1,600 deg. had been reached, while with other samples only after they had been maintained at this temperature for one hour. We realized that these two methods of proceeding might give different results in some cases. At the same time, we made determinations of a number of other physical properties, such as absolute density, apparent density, weight of sulphate corresponding to basic oxides present, and finally compressive resistance at ordinary temperatures.

All of the good bricks, after being held at 1,600 deg. for one hour, showed a compressive strength greater than 10 kg. per sq. cm.; most of the good bricks exceeded 20 kg., while the poor bricks were below 5 kg. It seems evident, therefore, that rigidity at high temperatures is the most essential, if not the only important, quality of silica brick. Most of the good bricks have densities below 2.40, the very good ones being as low as 2.33. The amount of sulphate in good bricks is below 15 per cent.

Manufacturing Operations.

Selection of the Quartz.—The proportion of basic oxides should not exceed 3 per cent., which is equivalent to 10 per cent. of sulphate, if excessive fusibility is to be avoided. On the other hand, the percentage of impurity should not be below 1.5 per cent. to avoid the necessity for excessively high temperatures in order to cause complete transformation of quartz. An average of 2 per cent. of basic oxides represents good practice throughout the world.

Certain quartzes fall to powder during calcination and naturally cannot yield other than very ordinary brick; the large grains, the importance of which has been noted above, disappear during this operation. This fault is easily detected by a rapid heating to between 1,500 deg. and 1,600 deg., sufficient to cause transformation of the quartz into silica of low tensity.

Rocks of great hardness increase the expense of crushing; while, on the other hand, a rock that is too soft makes it difficult to obtain large grains, and especially those of angular shape. For this reason, true quartzites are generally preferred to sandstone, although the latter can be crushed more cheaply. In England, however, the Sheffield ganister, which has a very high reputation for the manufacture of silica brick, is a true sandstone.

Sands are the worst of all natural quartz materials for this purpose, on account of the fineness, the rounded outline, and especially the uniformity in size of their grains.

Crushing.—The crushing of quartz is always an expensive operation on account of the hardness of the material; it requires the expenditure of considerable energy and leads to a rapid wear of the crushing apparatus. Roller mills are most commonly applied, the operation being continued until the desired degree of fineness is obtained. This does not seem a rational method, because the relative proportion of the different sizes of material cannot be accurately regulated.

To obtain the larger grains, there is no reason for using roller mills, and it is preferable to use some form

of cylindrical crusher, requiring much less mechanical energy, and also yielding grains having a lammelar shape, which is most advantageous for the compactness of the brick.

If roller mills must be used, however, it is necessary to give them a sufficient weight, 5 tons at least, in order to enable them easily to crush fragments of quartz of the size usually delivered by the jaw crusher. If the roller mills are too light, they roll over the grains without crushing them, increasing greatly the cost of power and repairs, while also introducing particles of iron into the mixture, which later give rise to brown stains on the brick, after firing.

Addition of Fluxes.—Lime is the only flux regularly employed by manufacturers of silica brick; the proportion is generally between 1 and 2 per cent. M. Bied has proposed to add to the lime either oxide of iron or alkali. The advantage of a flux containing oxide of iron is that silica is only slightly soluble in it at high temperatures, and, therefore, the tridymite network is less rapidly destroyed than in other fluxes. In Martin furnaces, the bricks of the roof are often impregnated with oxide of iron to a depth of 10 cm. without seriously diminishing their resistance to heat.

The chemical composition of the fluxes is not the only important point; it is necessary to reduce them to a sufficiently fine state of division to allow them to mix intimately with the silica; this is the more important in proportion to the amount of impalpable silica in the mixture.

Wetting the Mixture.—The proportion of water added for the purpose of making the mixture workable should be enough to permit the brick to be carried to the dry house without danger of deformation. The quantity may vary from 8 to 16 per cent., according to the proportion of impalpable material; obviously, the larger the proportion of extremely fine grains, the more water is required.

Mixing.—Mixing, for the purpose of distributing the flux uniformly throughout the siliceous mass, is the more necessary according to the proportions of fine material. We have not yet found a perfectly satisfactory process for controlling the distribution of lime throughout the mixture, although this is a very important factor determining the quality of the brick. Inasmuch as the mixing operation is not very expensive, it would be much better to increase the length of the mixing process, even beyond what would appear to be strictly necessary. The operation is generally conducted in light mills revolving rapidly.

Molding.—Molding of the bricks is most often performed by hand, although there is some doubt as to whether this process is better than the use of a molding press. It permits, possibly, a more regular distribution of the mixture in the molds, and yields brick which, at 1,600 deg., possess the same mechanical strength as machine-pressed brick. In the case of a badly-fired brick, the final expansion, which occurs after the bricks are in the furnace roof, has better opportunity to relieve itself in the spaces of a very porous brick and thus produces much less external pressure. On the other hand, pressed brick, which are always dense and have greater strength at ordinary temperature, are much less permeable to the slag; this is important, as this permeability is an important factor in the destruction of brick. It would seem, finally, that for careful manufacture, high molding pressures are preferable, al-

though for second-quality brick, hand molding may be perfectly suitable.

Drying.—The molded brick must be dried before they are introduced into the kiln because they would otherwise be too soft to permit them to be piled one on another the abrupt application of heat, furthermore, would cause them to burst or at least crack by too rapid expelling of excessive water vapor.

The drying operation presents no difficulties and requires no special precaution. It is possible, immediately after molding, to put the bricks into a heated stove and dry them in a few hours. In this respect, silica bricks differ from clay bricks in that drying does not produce any contraction. With bricks containing a large amount of impalpable silica, the operation may require more care, but is never difficult.

Firing.—Firing is the most important feature in the manufacture of silica brick, and also the most expensive; unfortunately, the best conditions for firing are not yet fully understood. Tests are difficult to make on account of the length of firing and the dimensions of the furnace in which firing is done; firing often lasts for twenty days and may take place in a furnace holding 200 to 300 tons of brick at once.

The maximum temperature of firing is often considerably exaggerated. We often hear of firing temperatures of 1,500 deg. and even 1,600 deg., but we do not believe that any silica brick are ever actually fired at temperatures exceeding 1,400 deg.

In addition to the temperature, it is necessary to take into account the length of time during which the maximum temperature is maintained, and also the rapidity with which the heating is conducted. In case of too rapid a heating, the brick expands enormously, the direct transformation of the grains having preceded the formation of the network. From the theoretical point of view, it would seem that the best condition of firing would be to raise the bricks as rapidly as possible to the temperature at which the large quartz grains begin to transform directly, but slowly; this would give the network of tridymite an opportunity to develop more rapidly than the isolated grains transform, which is indispensable in order to limit expansion. This temperature would then be maintained a sufficiently long time to allow the transformation of large grains to be completed.

We should mention an absolutely contrary theory maintained by certain manufacturers on account of its economical advantages. This involves firing at a very low temperature, in order to form the indispensable network, but allowing the grains of quartz to remain untransformed; the final heating is afterward finished in the steel furnace. This process has the advantage of not introducing cristobalite into the brick and thereby diminishing the danger of fracture; on the other hand, at high temperatures, brick of this character would be subject to considerable expansion, leading to a warping of the furnace roof. If, however, the proportion of impalpable silica has been sufficient, and if the firing has been sufficiently prolonged, the tridymite network may perhaps be sufficiently solid to offset the danger of expansion.

We should also mention a third theory, upheld by certain American authors; well-burned bricks are good; slightly-burned bricks are mediocre; but medium-burned bricks are composed principally of cristobalite and disintegrate into large fragments by fracturing.

WILL CONTROL STEEL OUTPUT.

Ottawa, Sept. 4.—The details of an order-in-council enlarging the powers of the War Trade Board insofar as the production, distribution and consumption of steel are concerned, made available this evening, show that this step has been taken because the Government has decided that it is impossible to sufficiently augment supplies by importation.

The order empowers the War Trade Board to make such orders as may be deemed advisable to increase the production of iron and steel and the goods and articles made from steel. In cases where such production cannot be secured without the Government placing orders and giving assistance, orders of the War Trade Board shall first be approved by the Governor-in-council.

The War Trade Board is given authority to employ engineers, steel experts, inspectors, accountants and other assistance necessary to effectively control the steel industry.

Producers and manufacturers of iron and steel who fail to carry out the orders of the War Trade Board shall be subject to a penalty of not less than \$500 and not more than \$5,000, or to imprisonment for a term not exceeding six months, or to both fine and imprisonment.

The order emphasizes the fact that there is a serious shortage of steel, not only in Canada, but in the allied countries, and states that "the railways, transportation companies and other industries necessary to Canada are in danger of being greatly curtailed or seriously crippled through want of steel."

U. S. GETS TIN.

Washington, Sept. 11.—Two-thirds of the pig-tin supply of the world is to be received by the United States under a pooling arrangement made at a recent conference in London between representatives of this country, Great Britain, France and Italy.

This was announced by the War Industries Board, which said that all shipments of pig tin and tin ores to this country would be consigned to the American Iron and Steel Institute, which will distribute it at regular prices. Quotations of pig tin already have fallen 14c. a pound.

THE INSTITUTE OF METALS.

The autumn meeting of the Institute of Metals, London, was held on September 10th. The subjects discussed included:

"Effect of progressive cold work upon the tensile properties of pure copper," by N. E. Alkins (Manchester).

"The resistance of metals to penetration under impact," by C. A. Edwards (Manchester).

"Grain growth in metals," by Z. Zeffries (Cleveland, Ohio).

"Rapid recrystallization in deformed non-ferrous metals," by D. Hanson (Teddington).

"Influence of impurities on mechanical properties of Admiralty gunmetal," by F. Johnson (Birmingham).

"Rapid estimation of phosphorous in bronze," by T. E. Rooney (Teddington).

"Disintegration of a copper-aluminum alloy," by R. Sligman and P. Williams.

"Annealing cold, rolled aluminum sheet," by R. J. Anderson (Cleveland, Ohio).

"Mechanical properties of alloys of copper and zinc," by F. Johnson (Birmingham).

"Liquid fuel in the foundry," by Capt. A. E. Plant.

FERROMOLYBDENUM.*

By R. M. Keeney.

The use of ferromolybdenum in the metallurgy of steel is in its infancy. Previous to 1914, probably not over 10 tons was produced yearly in the United States, practically all of this being exported; but with the high price of tungsten, search for molybdenum ores became more active, and now several hundred tons per year are made in the United States, practically all of which is exported. The alloy has not been widely used because of the supposed scarcity of ore, and the prejudices of American steel manufacturers against it, owing to difficulties encountered in its use in steel. The scarcity of ore has been overcome, and at present Colorado is the largest producer of molybdenum in the world. The prejudices of American steel manufacturers have not, however, been overcome.

Ferromolybdenum was made from roasted molybdenite in the crucible before the introduction of the electric furnace, but can now be made directly from raw sulphide in the electric furnace. Another source of molybdenum is lead molybdate, wulfenite, which is fused with soda ash and carbon to produce lead bullion and sodium molybdate slag. The slag is then smelted in the electric furnace, with carbon as a reducing agent, and suitable fluxes, to produce ferromolybdenum.

The standard grade of ferromolybdenum is not well established. Some manufacturers make a product containing 50 to 80 per cent. molybdenum and 3 per cent. carbon and manage to sell it. Others, by different methods, make a product containing less than 1 per cent. carbon. A great deal of ferromolybdenum containing 0.25 per cent. sulphur has been sold but most consumers will not accept a product containing over 0.1 per cent. sulphur. Ferromolybdenum containing 80 per cent. molybdenum has a dull gray iron color, coarse structure, high density, and is non-magnetic. It does not break easily.

Raw materials used in preparation of ferromolybdenum may be: for ore, the sulphide, molybdenite, or sodium molybdate slag made from wulfenite; for reducing agent, some form of carbon, or 90 per cent. silicon metal ground to pass 60 mesh; for fluxes, lime and fluorspar. There are two methods of manufacture:

1. Reduction with carbon and excess of lime, according to the reaction:

$2\text{MoS}_2 + 2\text{CaO} + 3\text{C} = 2\text{Mo} + 2\text{CaS} + 2\text{CO} + \text{CS}_2$
pure molybdenite contains 60 per cent. molybdenum and 40 per cent. sulphur. According to the above reaction, 100 parts of molybdenum are reduced from 170 parts of molybdenite by 18.8 parts of carbon. For every 100 parts of molybdenum, 58 parts of lime are necessary for slagging the sulphur as calcium sulphide. This reaction works out closely to the theoretical, and there is no difficulty in making a product with about 0.1 per cent. sulphur; the product will contain 1.3 to 3 per cent. carbon. If a lower-carbon alloy is desired, the crude metal is broken up and refined with an oxidizing slag of iron ore. The amount of iron in the alloy is varied as desired by the addition of iron turnings in the smelting furnace, or of iron oxide in the refining furnace.

2. Reduction with silicon metal, according to the reaction:

This method has been used recently in the production of 50 per cent. ferromolybdenum, although when this

grade is being made, ferrosilicon may be used. Lime is sometimes added to help slag the sulphur as calcium sulphide. By this method, the production of 100 parts of molybdenum requires 29 parts of silicon.

Ferromolybdenum containing 80 per cent. molybdenum and under 1 per cent. carbon cannot be regularly tapped from the electric furnace because of its high melting point, so that when this grade of alloy is to be made, the furnace must be of the knock-down variety, for removal of the button. The slag is tapped off, and when this operation is finished the metal is dug out. A 50 to 60 per cent., low-carbon product can be tapped, and a considerable quantity of this grade is made in tapping furnaces.

Molybdenum in Steel Manufacture.

Ferromolybdenum is added to steel as a fixed addition, nearly all of the molybdenum remaining in the steel. It is supposed to give the steel properties similar to those of tungsten steel, but only one-third to one-half as much molybdenum is necessary; that is, where regular high-speed steel contains 18 per cent. tungsten, 6 to 9 per cent. of molybdenum may be substituted. However, it gives these properties only when the addition is properly made and proper heat treatment follows. The regulation of these factors caused so much trouble and expense that, in this country, the manufacture of molybdenum high-speed tool steels has been practically discontinued for several years. It is used for this purpose abroad, however, to a considerable extent. At the present time, it is mainly employed in tool steel as an auxiliary rather than as a major constituent.

Various reasons have been assigned for the discontinuance of the use of molybdenum in these steels. Taylor found that molybdenum in rapid steels caused irregular performance; that steels of the same composition and having had seemingly the same treatment gave large variations in their maximum cutting speeds. One manufacturer has stated that the ingots crack in forging, the tools crack on quenching, and molybdenum appears to volatilize from the steel when heated; the latter might be due to the production of molybdenum oxide, which is much more volatile than the metal itself.

When small quantities of molybdenum, say 0.25 per cent., are added, the elongation and elastic limit of the steel are greatly increased. When molybdenum is combined with nickel, the resistance to shock is increased without diminishing the elongation. Its utilization for linings of big guns was originated by the Germans with such success that the Allies are said to use it now for the same purpose. This may account for the heavy exports of molybdenum.

HOOVER'S ESTIMATE FOR NEXT YEAR.

Mr. Herbert Hoover, of the American Food Administration, who visited England and France to confer with the Food Controllers of the Allies, says that this continent next year will have to supply the Allies with 4,000,000,000 pounds of fats, 900,000,000 pounds of beef products, 500,000,000 bushels of cereals, and 1,500,000 bushels of sugar. In addition to the former responsibilities overseas, next year there will be the feeding of an enormous American army in Europe.

"We have to make good," says Mr. Hoover. "We can do it, if we simply have the will to live with every economy, and waste nothing."

*Extracts from a paper presented at the Colorado meeting A.I.M.E., September, 1918.

ONTARIO'S METALLIFEROUS PRODUCTION FIRST HALF YEAR, 1918.

Returns received by the Ontario Bureau of Mines for the six months ended June 30th, 1918.

In the table given below, for purposes of comparison, the quantities and values are given for the corresponding period in 1917:

Summary of Production, First Six Months, 1918.

Product.	Quantity.		Value.	
	1917.	1918.	1917.	1918.
Gold (ounces)	228,673	229,421	\$4,586,941	\$4,648,164
Silver (ounces)	10,073,787	8,736,002	7,584,439	8,267,624
Cobalt, metallic (lbs.)	162,250	118,889	237,004	249,045
Nickel, metallic (lbs.)	45,864	208,802	19,073	83,332
Nickel oxide (lbs.)	5,495	21,768	1,648	5,551
Cobalt oxide (lbs.)	153,498	259,371	175,308	339,052
Other Cobalt and Nickel Compounds (lbs.)	122,076	222,039	15,879	27,505
Nickel in matte (tons)	20,230	21,393	10,115,000	12,385,950
Copper in matte (tons)	10,381	10,708	4,152,400	4,283,040
Copper ore (tons)	1,543	16	45,688	318
Iron ore (tons)	69,209	106,196	231,937	424,259
Pig iron (tons)	347,190	341,182	6,067,050	9,256,599
Molybdenite, concentrates (lbs.)	36,777	32,656	47,942	45,845
Lead, pig (lbs.)	912,934	776,711	114,953	66,630

Copper in matte was valued at 20 cents and nickel at 25 cents per pound in 1917. For 1918 the values have been placed at 20 and 30 cents per pound respectively.

Considering the handicaps under which gold miners are operating, a small increase in production, as compared with the first half of 1917, is a creditable showing. In the Porcupine camp, the Dome, Porcupine Crown, Porcupine V. N. T. and Schumacher have ceased milling operations. The Croesus in Munro Township, the Tough-Oakes at Kirkland Lake and St. Anthony at Sturgeon Lake are in the same category. This curtailment of output is offset by the new producers of gold, Lake Shore at Kirkland Lake and Davidson at Porcupine. The 40-ton mill of the Patricia Syndicate at Boston Creek started operating the latter part of June. A promising vein carrying gold telluride has been discovered on the Miller Independence at Boston Creek. Shaft sinking is proceeding, and arrangements made to increase the milling capacity at this property. Considerable activity at Boston Creek has resulted from these developments. In the new Matachewan camp, from the claims under option to the Nipissing Mining Co., some spectacular samples of gold ore have been secured. Diamond drilling on the Otisse claims is said to be producing satisfactory results. During the period the Porcupine camp produced 207,731 ounces of gold and Kirkland Lake 17,927. A total of 515,094 tons of ore was milled with a recovery in gold and silver valued at \$4,692,529.

Although shipments for the first half of 1918 were lower by 1,367,785 ounces than for the corresponding period of 1917, the value was \$683,185 greater, the average price of silver per ounce for the two periods being 92.8, as against 75.4 cents. Companies shipping over one-half million ounces are given in order: Nipissing, Mining Corporation, Kerr Lake, O'Brien, Buffalo, Coniagas and Temiskaming. New shippers this year include Edwards & Wright, Ltd., operating the old Green-Meehan mine; the Silver Eagle of Silver Centre;

the Keeley mine in South Lorrain, where a high-grade vein has been uncovered. There was also a clean-up by the Lumsden Mining Co. The National Mines, Ltd., recovered and treated tailings from Cross Lake that had been deposited there by the Old King Edward and Silver Cliff mines. The Mining Corporation of Canada is now treating a larger tonnage of slimes and tailings from Cobalt Lake in the new mill. Silver was recovered from gold ores to the extent of 47,427 ounces.

There were treated at Deloro, Thorold and Welland 2,659 tons of ore and concentrates, and 1,116 tons of residues with a recovery of 2,753,701 ounces of silver. In addition, cobalt and nickel were produced in metallic form, also as oxides and sulphates. The Deloro Smelting & Refining Company uses a considerable proportion of its output of metallic cobalt in the manufacture of "stellite" which contains about 55 per cent. of cobalt.

As a result of high mining costs, together with increased freight rates, except that of the nickel-copper ores, has become unprofitable. The only shipper was the Hudson Copper Co. at Havilah.

Increased Output of Nickel-Copper Matte.

Nickel-copper mining and smelting shows an increase in output. During the half year, 804,640 tons of ore was raised from the operating nickel-copper mines. Ore smelted was 717,119 tons, producing 40,178 tons of nickel-copper matte.

Pig Iron and Steel.

Pig iron produced in the half year shows little change in quantity, as compared with the corresponding period in 1917, but in value the increase is over 50 per cent. There were 75,716 tons of Ontario ore, and 601,751 tons of foreign ore smelted by the eight furnaces in blast. Steel produced in the period totaled 432,326 tons, worth \$13,739,602.

Molybdenite.

The production of molybdenite concentrates for the half year shows a small decline in quantity, but the value was nearly as great as in 1917.

Lead.

There was only one producer of lead ore in the province during the half year, the James Robertson Estate. Operations, both mining and smelting, are carried on at Galetta. The pig lead product is used by the company in Montreal.

BRITISH COLUMBIA COAL PRODUCTION.

The July tonnages for British Columbia collieries are most encouraging, as the figures show that the production is holding with the pace set at the beginning of the year and indicate that there is a good chance that the province will, when the statistics are compiled at the end of the twelvemonth, be found to have outstripped all previous records.

Following is the production of the various collieries for July:—

	Tons.
Crows Nest Pass Coal Co., Coal Creek	37,922
Crows Nest Pass Coal Co., Michel, B.C.	19,407
Corbin Coke & Coal Co., Corbin, B.C.	13,454
Middlesboro Collieries, Merritt, B.C.	7,988
Fleming Coal Co., Merritt, B.C.	3,504
Coalmont Colliery, Coalmont, B.C.	347
Princeton Colliery, Princeton, B.C.	3,145
Canadian Western Fuel Co., Nanaimo, B.C. ..	61,563
Canadian Collieries (D), Ltd., Comox, B.C. ...	46,698
Canadian Collieries (D), Ltd., Extension	18,650
Canadian Collieries (D), Ltd., South Wellington, B.C.	2,122
Pacific Coast Coal Mines, South Wellington, B.C.	6,775
Nanoose Colliery, South Wellington, B.C.	2,285
Granby Colliery, Cassidy's, B.C.	2,718

It will be noted that there are three mines on the producers' list which have not been there for some time. Two newly opened mines are the Canadian Collieries' mine at South Wellington, which has 2,122 tons to its credit, and the Granby Mine at Cassidy's, B.C., with a production of 2,718 tons. These, while comparatively small at present, will grow and, no doubt, will become a material factor in British Columbia's coal output. The Coalmont Colliery is the other new name on the list. Although it starts with the modest tonnage of 347 tons for the month, more may be expected of it in the near future.

COAL NOW \$9.50 PER TON AT VANCOUVER.

The price of domestic lump coal has been raised in Vancouver, B.C., from \$8.80 a ton to \$9.50 by most of the retail dealers. This increase, it is assumed, is the result of the recent action of the Canadian Fuel Controller in permitting certain of the Vancouver Island Collieries to raise their selling prices. The view taken by the Controller on the occasion in question was considered rather unusual, inasmuch as he authorized a maximum selling rate of \$6.55 a ton to all the Island mining companies, with the exception of the Canadian Western Fuel Co., which was not sanctioned to raise its quotations beyond the maximum which had previously prevailed, namely, \$5.80 a ton. The explanation given was that investigation had proved that, owing to circumstances over which they had no control, all other collieries were subject to greater production charges than the C. W. F. Co., and that the latter was the only one which was making what might be considered a fair profit on the capital investment. The Vancouver public, however, take the position that dealers handling C. W. F. coal, as well as others, have raised prices and that some must have gone beyond the power given them by the Controller when he set their maximum profits at 50 cents a ton. It is suggested that an investigation is in order.

MANGANESE ORE FROM KASLO, B.C.

Returns have been received from the Mines Branch, Ottawa, on several samples of manganese ore sent from the Kaslo, B.C., property for assay.

They follow:—

Sample No. 1.	
Loss on ignition	17.15
Manganese	51.45
Iron	6.17
Silica	7.32
Phosphorus	0.07
Sulphur	0.06

Sample No. 2.	
Loss on ignition	15.45
Manganese	52.42
Iron	5.22
Silica	7.30
Phosphorus	0.11
Sulphur	0.09

Sample No. 3.	
Loss on ignition	13.88
Manganese	59.97
Iron	0.88
Silica	2.30
Phosphorus	0.15
Sulphur	0.45

THE MANGANESE DISCOVERY IN COWICHAN DISTRICT, B.C.

With regard to the recent manganese discoveries in the Cowichan district, Vancouver Island, Mr. Geo. C. Mackenzie, who has just been to Victoria, returned from an inspection of one of these properties, which is situated on the summit of the Divide between the Che-mainus and Cowichan Rivers and within easy reach by aerial tramway of the Esquimalt & Nanaimo Railway, speaks very enthusiastically of its possibilities. Although no development work has been done, Mr. Mackenzie took samples from the surface which ran high in values. He states that there is a surface exposure 100 by 20 ft., which, allowing for a depth of 10 ft., a very conservative estimate, and figuring manganese at its present price of \$70 a ton f.o.b. Chicago, Ill., means that there is \$140,000 worth of ore immediately available. "I saw all the best manganese of Nova Scotia and New Brunswick last summer," Mr. Mackenzie declared, in giving his impression of this claim, "and I never saw anything better."

As it had been proposed importing ferro-manganese from India for use in the manufacture of munitions in Canada, Mr. Mackenzie thought that the location of these properties on Vancouver Island was of first importance. He thought it likely that the War Trade Board of Canada, in co-operation with the locators and owners, would arrange for their early development, in which event, owing to their accessibility, it would not be long before ore was being shipped.

How Manganese Was Found at Cowichan.

There is an interesting sidelight to the discovery of the manganese, the situation of which has been described. Its locator is Pte. Tom Service, who fought with an Engineers' Corps in France, and who had a part in the mining of Hill 60, which, as will be recalled by all who have followed the course of the war, was blown up by means of what was the greatest mine in history up to that time, a strong German fortress being literally obliterated. Service returned to Canada only a few weeks ago. He saw manganese samples from

another part of the Cowichan district and exclaimed that he knew where there was more of the same ore, and could find it without trouble. He went out, staked and recorded the claim in question and has named it "Hill 60." So there now is a "Hill 60" on Vancouver Island which gives promise of supplying quantities of the raw material for the production of munitions necessary to drive the Hun out of the fair lands he has invaded and devastated.

In the new bulletin K-303 issued by the Canadian Ingersoll-Rand Company, Limited, the class EL-2 two-stage, straight line air compressor is described. The bulletin indicates the advantages of the tandem arrangement for certain classes of work where economy of space is to be combined with the advantages of two-stage compression, and goes on to give details of construction, including the leaf valves and other features. The bulletin concludes with a note on the short-belt drive, with which this type of compressor can be furnished, and which has distinct advantages where space is at a premium.

The value of gold bullion deposited at the Dominion of Canada Assay Office, Vancouver, B.C., during the month of August, 1918, was \$608,838.43, which is an increase of \$253,845.88 over the same month of 1917. Most of this gold came from the Yukon.

B.C. Department of Mines Will Drill Iron Ore Deposits.

The establishment of an iron and steel industry in British Columbia is earnestly desired by the Provincial Government and, although no action of a definite character has followed the enactment at the last session of the Legislature granting a bounty of \$3 a ton on pig manufactured from local ore in British Columbia and \$1.50 a ton on pig manufactured from foreign ore in the province, Hon. Wm. Sloan, Minister of Mines, still looks forward confidently to the development of the country's magnetite deposits.

In a recent statement, the Minister said that the bounty did not seem, so far at any rate, to have had the desired effect. There had been enquiries regarding the iron ore resources of the province, it was true. Capitalists had shown some interest and still were doing so. Properties were being investigated by private interests, but, in spite of these gratifying indications, he was not satisfied.

In his opinion, there was an opportunity offering now for the establishment of an industry on the Pacific coast which would lead to the utilization of the magnetite of the province, as well as the material advancement of its commercial interests. Convinced that no time should be lost, and firmly of the belief that, with a proper realization of the resources of the country, capitalists would not hesitate to undertake development, Mr. Sloan declared that he had decided to diamond drill a number of the most promising properties for the purpose of gaining a definite idea of the tonnage available and also to give those interested a practical demonstration of the possibilities of the industry in question. His engineers had been carrying out investigations with this work in mind and properties had been selected. He, therefore, was able to announce that tenders would be called for at an early date for the diamond drilling of iron properties, and the work thereon would be proceeded with as expeditiously as possible in order that the desired information might be put before those who might be interested in the iron ore deposits of the province without loss of time.

PERSONAL

Mr. H. E. T. Haultain was large responsible for the excellent exhibit of Vocational Training for Returned Soldiers at the Toronto Exhibition. It was one of the most attractive and instructive exhibits on the grounds.

Mr. Mark Workman, president of the Dominion Steel Corporation, who has spent several days between Montreal and Ottawa, has returned to Sydney, where he will remain this month.

Mr. D. H. McDougall, president of the Nova Scotia Steel and Coal Company, is said to be identified with the development of mining areas at Beersville, Kent County, N.B.

Mr. C. A. Magrath, Fuel Controller, has been appointed Director of Coal Operations in Nova Scotia and New Brunswick.

Prof. S. F. Kirkpatrick, head of the Department of Metallurgy, at School of Mining, Kingston, is resigning. He is metallurgist for the Deloro Mining & Smelting Co.

Mr. J. B. Tyrrell is in Newfoundland. He is expected to return to Toronto in the latter part of September.

Mr. E. Jacobs is in Phoenix, Arizona.

Mr. W. R. Burge, of the Canadian Allis Chalmers, Ltd., has been promoted to the managership of the Ontario district office.

Mr. R. T. Regnall, formerly of the Dome Lake, has succeeded R. N. Palmer as underground superintendent at the Hollinger Consolidated.

Mr. R. Home Smith will be Ontario's new Fuel Commissioner, according to information received by The Globe recently. He will succeed Mr. R. C. Harris, City Works Commissioner. Assisting Mr. Smith, either as adviser to the Commissioner or as Deputy Fuel Controller, will be Mr. E. L. Cousins, Chief Engineer and Manager of the Toronto Harbor Commission, who has been long associated with Mr. Smith on the Harbor Commission.

Mr. J. C. Nichols and Mr. J. W. Rawlins, of Copper Cliff, are inspecting copper concentrating plants in Arizona.

Burnett & Crampton is a new firm of engineers and iron founders which has recently been established at Rigaud, Que. They have a very well equipped shop, capable of handling eight tons per day with a machine shop, pattern shop and blacksmith's outfit. Mr. Burnett was the electrical engineer for the Canada Cement Co., Ltd., and also has had considerable mechanical and foundry experience. Mr. P. P. Crampton is very well known to the mining industry through his previous connection with the Hull Iron & Steel Foundries, Ltd.

Mr. Oscar Lachmund has resigned his position as general manager of the Canada Copper Corporation, and will leave its employ this month. He is to be succeeded by Mr. H. R. Van Wagoner, of Denver, Colorado, who has been in British Columbia looking over the situation and is to return to take up his new duties in a few weeks.

The reinforced concrete cargo steamship "Faith," which left a California port some weeks ago for a west coast South American port, was, a few days ago, reported as having arrived safely and in first-class condition. The "Faith" is discharging her cargo of lumber and is expected to reload for an American port, which she will reach via the Panama Canal.

SPECIAL CORRESPONDENCE

NORTHERN ONTARIO.

Cobalt Silver-Ore Shipments.

During the month of August twenty-eight car-loads of ore were shipped from the Cobalt camp. Thirteen mines were represented in the shipments, the aggregate weight of which was 2,063,554. The details of the month's shipments were as follows:—

Mine.	Lbs.
Buffalo	328,959
McKinley-Darragh	313,393
Nipissing	234,120
Dominion Reduction	231,400
LaRose	210,366
Coniagas	170,370
O'Brien	128,110
Kerr Lake	118,545
Trethewey	77,165
Hudson Bay	65,772
Penn-Canadian	64,688
National	60,665
Aladdin	60,000
Total	2,063,554

Hattie Gold.

According to advices received from Matheson, the development work under way at the Hattie Gold Mines is progressing favorably and giving satisfactory results. The new vein recently discovered has been sunk on for a depth of 25 feet, at which point it was found to be four feet in width. On the No. 2 vein, considerable trenching has been done and good ore and tellurides, as well as free gold, is in evidence for some distance. The company expect to have their new plant, which consists of an 80-h.p. boiler, with six-drill compressor and hoist, installed at an early date.

Gold Discovered in Bristol Township.

It is reported here that a rich discovery of gold has been made in Bristol Township, near the Ogden Township line. The story is to the effect that a vein 400 ft. long has been uncovered, and while the width of this vein has not been mentioned, channel assays are said to run up to \$1,700 in gold to the ton. In the early days of the camp, this township was well prospected and some fair showings were found. A number of prospectors have left for the district on the news of the recent discovery, and much activity is predicted for the district.

Matachewan.

A number of prospectors returning from the Fort Matachewan district recently brought out news of a rich gold discovery having been made on the claims being developed by the Nipissing Mining Company, of Cobalt. The specimens claimed to have been seen by these men are said to have been as rich as "Croesus ore." Captain H. L. Donaldson, who is in charge of the work at the property when questioned about the find, refused to give any information beyond stating that some gold had been uncovered. So far as known, no considerable quantity of ore has been found on this property.

Giroux Claims will be Developed.

The claims of Fred Giroux, situated in Lorraine Township, near Lake Latour, are to be operated; arrangements having already been made to begin the work. Some years ago a shaft was driven to a depth of 50 ft., and a crosscut commenced to cut the vein, which, on the surface, contained considerable native

silver and a large quantity of nicolite and smaltite. However, the vein was not reached before the work was discontinued. Local men, including J. J. Anderson, Gordon Cameron and George Watts, are parties to a lease of the property for two years on a fifty-fifty basis with the owner. It is proposed to cob out the high grade and ship it to Cobalt for treatment as the work proceeds.

Mining Corporation.

The production of over two million dollars worth of silver for the eight months of the current year just ended, by the Mining Corporation of Canada, means another exceedingly prosperous year for this company. This production is only about \$200,000 below the first nine months' period of 1917. This achievement is all the more remarkable when it is remembered that the company commenced the current year with estimated ore reserves of 1,500,000 ounces. This demonstrates the probability of all mines of the camp, where the ore reserves are substantial, finding their career lengthened to a considerable extent, as has been the case with the Mining Corporation. The treatment of approximately half a million tons of sands and slimes from previous operations of the company will probably add materially to the net income for the current year as a portion of the mill treating about 350 tons per day was placed in operation on this material the first week of the present month. It is proposed to gradually increase the capacity of this plant until between 650 and 700 tons per day are being handled. The slimes will be treated by cyanidation in the low-grade cyanide mill, while the sands will be re-ground and treated by oil flotation. The plant will be the largest of its kind in the Cobalt Camp when completed.

Gowganda.

Steady progress is being made at the Walsh property in Gowganda, which is being worked by the Crown Reserve Mining Company of Cobalt. Several weeks ago the announcement was made of the encountering of high-grade silver ore at the 100-ft. level of the property. Since this time the shaft has been sunk to the depth of 200 ft., a station cut, and cross-cutting is now under way to tap the vein at the 200-ft. level.

Ophir.

The announcement that the Mining Corporation of Canada has taken an option on the Ophir Mining Company's property in south-eastern Coleman Township has been the cause of considerable interest. The Ophir has been well known for years, and is one of the oldest mines in the Cobalt Camp. It is understood that under the arrangement, the Mining Corporation is to spend not less than \$2,500 per month on the property. The new operators took possession this week and are continuing the work of sinking the winze to the contact, which was under way by the original company. Where the vein left this working, it was wide and heavily mineralized. As soon as the contact is reached, a cross-cut will be run to encounter the vein. The strong financial position of the Mining Corporation assures the thorough exploration of the property.

Sinking a Shaft at Miller-Independence Mine.

The work of sinking the shaft at the Miller-Independence property to the 200-ft. level, and cross-cutting the vein at this depth is now under way and the next two weeks' developments at this property would appear to have a vital bearing on the future of the Boston Creek camp. The shaft is being sunk on the vein, keeping the hanging-wall side of the vein as one side of the shaft.

However, as the shaft is 7 ft. by 9 ft., the whole width of the vein is not being proven, and its exact width will not be known until the 200-ft. level is reached. From the surface to the 100-ft. level, the vein was determined to range in width from nine to twelve feet. With the shaft down 200 ft., and drifting both east and west at the 100 and 200 ft. levels, four faces will be available from which to draw ore for the enlarged mill to be placed in operation during the present month. A number of engineers have visited the property recently, and in each case where samples were taken for assaying, startling results were obtained. A large tonnage of rich ore has accumulated on the dump during the sinking of the shaft and it requires no searching whatever to pick out samples of ore containing large quantities of tellurides.

Elliott-Kirkland.

Plans are being made for the exploration of the Elliott-Kirkland property at depth by diamond drilling. The present workings have reached a depth of 500 ft., where considerable lateral work has been done. Although a characteristic mud-seam, along which ore deposition has been found to occur at other mines in the camp, is in evidence at the 500-ft. level of the Elliott-Kirkland, so far results met with have not been up to expectations. It has been discovered that the lamprophyre formation intruded from the north, where porphyry should occur, if geological conditions were ideal.

Ontario-Kirkland.

It is expected the plant of the Ontario-Kirkland mining company will be installed and ready for operation by November. In the meantime, work at the property is going ahead in a satisfactory manner. A large amount of building material is on hand, some of the buildings are up and the foundations for others are now being built. The Ontario-Kirkland was formerly known as the Hurd claim, and lies close to the producing mines of the camp. A number of large well-mineralized veins occur on the property.

Boston Creek.

The Mekks Syndicate, owning property near the Miller-Independence at Boston Creek, have made arrangements for the exploration of their property. This property is owned by Cobalt and Haileybury men. The name has been derived from the first letter of each of the owners' names.

McKinley-Darragh-Savage.

The McKinley-Darragh-Savage Mines has declared its regular dividend of three per cent., payable on October 1st to shareholders on record September 7th. This disbursement amounts to \$67,431, and makes 12 per cent., or \$269,724 paid during the current year. The McKinley-Darragh went on a dividend-paying basis in 1907, and since that time has paid a total of 241 per cent., or an aggregate amount of \$5,349,607, to the shareholders.

Altering Mill at Hill Gold Mine.

Alterations are being made to the mill of the Hill Gold Mines, near Painkiller Lake, in the Munroe district. The mill building is also being enlarged. In the meantime, underground operations have been suspended. Only a small number of men are employed at the property.

BRITISH COLUMBIA.

May Work Platinum and Gold Placers.

There is a prospect that the Peace River country, a large expanse of territory to the extreme north-east of the province of British Columbia, will become a platinum producer. A syndicate, at the head of which are

Dr. W. L. Hartman, of Detroit, and Mr. L. Bright, of Chicago, is reported to have secured control of large placer grounds in this section, to which will be shipped this fall two large Keystone drills and a modern dredge, with a capacity of 100,000 cubic yards of gravel a month. Prospecting is said to have proved the presence of both platinum and gold in paying quantities, and operations are to be carried on by a considerable force of men.

Offers Scholarships for Members of Families of Employees.

To encourage the sons of its employees to obtain technical training, the Canadian Consolidated Mining & Smelting Co. has announced, through Mr. J. J. Warren, managing director, that it will give a scholarship of \$500 per annum, commencing next year, to the man standing first, among the families of its employees, the latter being restricted to those engaged at day labor, in his matriculation examination for an applied science course in the British Columbia University. The further study, which this grant will help finance, may be taken at the B.C. or any Canadian University. It is explained that the company's operations are becoming so extended that there should be, in the future, plenty of scope for the use of men of technical knowledge and, while the policy at present is in its experimental stage, it is likely, if creating the interest hoped for, to lead to development by the corporation of the brains that will be needed for the direction of its operations in coming years.

Developing a Fluorspar Deposit Near Grand Forks.

When Hon. Wm. Sloan, Minister of Mines, accompanied by Mr. J. E. Thompson, member of the British Columbia Legislature for Grand Forks, was making an inspection of the plant of the Canadian Consolidated Mining & Smelting Co. at Trail just about a year ago, he was told of the problem of hydro-fluosilicic acid, it being pointed out that the fluorspar necessary in its manufacture had to be imported from Kentucky, a distance of from 1,500 to 2,000 miles, which made the costs so high that the discovery in this province of such a deposit was a matter of importance to the industry. That such, in fact, was the condition has since been shown, the company having bonded a group of claims known as the Rock Candy group, located on the north fork of the Kettle River, above the city of Grand Forks. Since then, much development work has been done, a car of ore already having been loaded for shipment to Trail. The need of the fluorspar being urgent, no time was lost in putting the property on the producing list and, in view of the difficulties which had to be overcome, what had been accomplished in a short time is worthy of note. The company first had to build a trail, and over this supplies and equipment, including a diamond-drill outfit, had to be packed in on horses to the property. The horses on the return trips have been bringing out ore, so that the company could get a car for test purposes at the earliest possible moment, and the result will no doubt have material bearing on future development, although the property already is regarded as having passed the experimental stage. A right-of-way has been cut through for a new wagon road, towards the construction of which the Mines Department is extending assistance, and before winter, the mines are expected to be making regular shipments.

Some interest has been created in British Columbia by the statement, appearing in the "Financial Post of Canada," that the Canadian Consolidated Mining &

Smelting Co., or interests associated with that concern, are reported to be contemplating the establishment of a steel industry in this province. The site for the plant is said to be near Trail, B.C. Confirmation of this cannot be secured from the local officials of the company.

The Ladysmith Smelting Corporation has ceased operations at Ladysmith again; its smelter having been run for a short time, during which period an accumulation of ore was disposed of. It is understood that options it had taken on a number of British Columbia mining properties, in order to assure a constant supply of ore for the smelter, will be allowed to lapse.

Dividends Declared by B.C. Companies.

Dividends have been declared by five of the chief mining corporations for the first eight months of the current year as follows:—

Granby Consolidated Mining, Smelting & Power Co.	\$1,124,886
Canadian Consolidated Mining & Smelting Co.	523,872
Hedley Gold Mining Co.	72,000
Britannia Mining & Smelting Co.	198,415
Crow's Nest Pass Coal Co.	62,128

May Develop B.C. Iron Deposits.

If the smelter tests prove favorable, immediate developments of considerable deposits of "bog iron," situated on the mainland of British Columbia and near the Pacific Great Eastern Ry., is promised by the operators of the Irondale Foundries. The company expects that the experiments will prove satisfactory and, when that is definitely established, plans to instal the plant necessary for the handling and shipment of the ore in bulk from Mons, a P. G. E. station, close to the properties, to the Irondale furnaces. The run from Mons to Squamish, on the coast, is about forty miles long and is all down grade, and it is proposed erecting bunkers at the latter point with a capacity of 2,000 tons. It is estimated that approximately 600,000 tons of the ore is readily available, while, with proper equipment, a much greater quantity can be recovered.

The Magnesium Sulphate Deposits at Maple Creek.

The announcement that the immense deposit of sodium sulphate and epsom salts, thirty miles north of Maple Creek, near Swift Current, Saskatchewan, contains much potash, has created much interest in British Columbia as, no doubt, it has throughout Canada and America. For several years there has been considerable prospecting for potash in this province, it being the opinion of many that in some sections conditions are in every way favorable for such deposits. The bottoms of a number of lakes in different interior districts have been found crusted with what, in most instances, has proved to be carbonate of soda. The most notable case of this is a lake near Ashcroft, B.C.

Mrs. A. E. Jowett of Trout Lake, B.C., who was the only lady prospector in attendance at the recent mining convention at Revelstoke, B.C., has been able to demonstrate that, even in a rugged country such as the Kootenays of British Columbia, a member of the fair sex can successfully locate, record, and arrange for the development of mineral. Mrs. Jowett has been prospecting in the neighborhood of Trout Lake for a number of years and is the owner of a number of promising properties. One of these is known as the Foggy Day Claim. It has shipped nine tons of ore, giving returns of 4.29 ounces in gold; sixteen ounces in silver; and 4.6 per cent. lead, with an assay value of \$100 a ton.

VANCOUVER ISLAND MINE SAFETY ASSOCIATION.

The coal-mining communities of Nanaimo, Ladysmith, Extension, Wellington and Comox were well represented at the annual meeting of the Vancouver Island Mine Safety Association, which was held at Cumberland on the afternoon of Monday, September 2nd (Labor Day), and the competitions, both in mine rescue and first-aid work, were keen and of high standard.

Hon. Wm. Sloan, Minister of Mines, who attended in person, expressed gratification at the interest manifested by the large attendance from the Island mining district, stating that the members of the various teams demonstrated a gratifying intimacy with the knowledge of their work. He congratulated the programme committee on their arrangements, which were admirable.

In the chief event, the honors were carried off by Nanaimo teams (Canadian Western Fuel Co.), although those from neighboring centres gave them a close run.

In mine rescue competitions, there were six teams entered, and in the first-aid contests, eight teams competed. No. 1 Team (Captain David Brown, of Nanaimo) won the main contest in the mine-rescue contest, the Draeger apparatus being used, its score being 96 points. Second place was taken by the team representing the Reserve Mine (C. W. F. Co.) with 94.4 points. Its captain was Robert Laird. The judges were Mr. H. H. Sanderson, mine safety engineer, Seattle, Wash.; Mr. George Wilkinson, Chief Inspector of Mines for British Columbia; and Mr. J. G. Daniels, mining engineer of the Pacific Coast Coal Mines. Chief Inspector Bagley, of the State of Washington, who had consented to act as a judge, was unable to be present owing to the recent explosion at Burnett, Wash., work in connection with which demanded his attention.

The first-aid contest for the Coulson Cup was won by Mr. J. W. Jemson's team, Nanaimo, the other members of which were Messrs. J. M. McGuckir, R. Shields, G. Langham and James West, while second place was taken by a Cumberland team, the personnel of which follows: Messrs. A. R. Stacey (captain), N. Bevis, J. Quinn, Wm. Beveridge and John Williams. The contest for the Department of Mines' cup and medals was won by No. 1 Team, Canadian Western Fuel Co., which was captained by Mr. Joseph Barton, with whom were Messrs. John Thompson, R. Charnock, James Brown and D. Stobbart. Second place was won by an Extension team, captained by Mr. Alex. Wright, the other members being Messrs. John Wright, Robert Houston, Allan McDonald and Alec Brown. In the three-men event (first aid), a Nanaimo team, made up of Messrs. George Carson, J. A. Challinor and W. Carson, were successful. The two-men event went to Bevon, Cumberland, the winners being Messrs. J. G. Quinn and J. L. Brown.

Mr. Sloan, in distributing the prizes, referred to the importance of such meets from the standpoint of mining, and spoke of the importance of the competitions, which had just been held, as a means of perfecting the instructions of those taking part. He announced that the next year's contests would take place at Nanaimo, and preparations already were under way to make them the most important ever held in Western Canada; in fact, it was proposed that their scope should be enlarged to take in other sections of the Pacific coast. As the representative of the Nanaimo district in the local Legislature, a position of which he was proud, he intended taking an active part in seeing that it was made an outstanding event.

SMELTER CHARGES INCREASED.

The announcement by the Canadian Consolidated Mining & Smelting Co. of further increases in smelting charges has again somewhat stirred the mine operators of British Columbia and promises to bring prominently to the fore the agitation for a Royal Commission to investigate the affairs of the company, with special reference to the fairness or otherwise of its smelting rates. This matter is before the Dominion Government still, and it is expected that something will be known as to its policy at an early date.

Following is the company's latest statement:—

"Trail, B.C., July 31st, 1918.

"To Lead Ore Shippers:

"Since Schedule B lead-ore rates was published, we have been obliged to pay 40 cents per ton more for coke to the collieries, which under that schedule amounts to an increase of 10 cents per ton of ore. In addition to this, there may be an increase of freight on coke; but we are not certain yet of this, and there will be a further increase in price effective August 1st.

"We have been obliged to increase the wages at the smelter by 30 cents a shift, so that there is an increase of 45 cents per ton under Schedule B on this account.

"Effective August 1st, we will, therefore, increase the base rate under Schedule B by 55 cents per ton, plus 25 per cent. of the further increase in coke price and freight.

"Effective August 12th, rates on lead from Tadnac have been increased to \$14.30 to Toronto, and \$16.50 per ton to Montreal. The increase in freight rate from that which prevailed at February 1st is, therefore, \$2.30 per ton on shipments to Toronto, and common points and \$4.50 per ton to Montreal and common points. Commencing with shipments received here in August, we shall be obliged to make an adjustment on account of this freight increase.

"As there is considerable difference now between the Montreal and Toronto freight rates and it is impossible to forecast the distribution owing to variations in munition demand, we, therefore, as the simplest plan, to make this adjustment commencing with the ore received in August, by reducing the lead settlement price by the actual increase in the lead freight rates.

"We will advise you as soon as possible of the amount of the further increases in coke price and freight.

"Yours truly, (Sgd.) S. G. BLAYLOCK,
"Assistant General Manager."

U.S. Navy Using British Columbia Coal.

Vancouver Island coal is being utilized by the United States Navy Department on a large scale, the Canadian Collieries (Dunsmuir), Ltd., having entered into a contract to supply as much as can be mined for export. One of the company's officials, in confirming the report, stated that there was no limit to the amount, it being understood that the Naval Department would take as much as could be delivered. Some weeks ago, the first cargo of coal under the new arrangement was loaded by a vessel of the U.S. Shipping Board's fleet at Comox for delivery at the Pearl Harbor Naval Station, Hawaiian Islands. Others have made calls for coal having a similar destination and all ships making their base at the Bremerton Navy Yard will burn Comox coal. This coal, some years ago, was subjected to exhaustive tests as to its suitability for use on American warships and, as a result, the British Columbia production was declared to be almost as good in steaming qualities as the American Navy standard.

DR. RUTTAN ON POTASH PRODUCTION.

"We are unable to state that there is any process going on in Canada at present where potash is being obtained economically from feldspar, in spite of announcements to the contrary," stated Dr. R. F. Ruttan, at a recent meeting of the Associate Committee on Chemistry of the Honorary Advisory Council for Scientific and Industrial Research. "There is one process that is commercially a success as far as it has gone, and that is hydrolysis of potash feldspar by means of lime and steam at a high pressure. This is being worked in New Jersey and on the Hudson River. The valuable product is a very high grade of brick for exteriors of high buildings, as its crushing strength, resistance to heat and hardness are better than other bricks, and about 6 or 7 per cent. potash is a by-product.

"It has been found that glauconite gives a better yield of the brick-making material and a better yield of potash than can be obtained from feldspar. This company is now utilizing the green sands of New Jersey for the manufacture of these bricks and potash. A report from British Columbia is that a bed of glauconite has been found there. If true, this can be utilized for obtaining potash. The same thing was found in connection with the ash from straw. In each case, the combustion is so rapid that the draught carried away most of the ashes. Condensation of potash salt from vapors of cement works has been a source in the United States, and one firm in Canada has introduced a few condensation pipes for experiments. Analysis of the material used in this plant justified the expenditure necessary to install a Cottrell system. There is no reason why analysis should not be made of the cement dust of all our large cement works through the country, and many, I am sure, could produce sufficient potash to justify the Cottrell process.

"A good deal of potash is now coming in Canada from hardwood ashes. The old industry of collecting these ashes and leaching them for their potash has been renewed in some of the cities, but how much is resulting from this source cannot be estimated. Glauconite is worked in England simply for its potash.

"Some investigations are being carried on in the Kingston School for Mining regarding the use of the nepheline syenite. This rock contained four or five per cent. potash. Progress is now being made in preparing a fertilizer from this rock. I am not sure whether it is a commercial success or not. Every encouragement has been offered those who are investigating methods for obtaining potash from feldspar. So far, there is no absolute proof that any of these processes are commercial."

TEMISKAMING.

The directorate of the Temiskaming Mining Company, Limited, has issued a special report to the shareholders. Production for the five months ending May was 391,367 ounces, while the ore reserves are estimated by the manager at 101,498 ounces. During the six months ending June last considerable development work was carried on, the footage in drifting, cross-cutting, winzing and raising totalling 1,496.2. There are still on the property three unexplored areas in which there are said to be reasonable possibilities of finding commercial ore bodies. It is ten years since the mine began shipping silver, while the total shipping production up to the end of 1917 was 10,837,021 ounces.

GRANBY PLANTS AT PHOENIX AND GRAND FORKS CLOSED DOWN.

From a mining standpoint, what is known as the Boundary District of British Columbia has suffered a blow in the recent closing down of the Phoenix Mines of the Granby Consolidated Mining & Smelting Co., with the consequent discontinuance of operation of the Grand Forks B.C. smelter. The absence of this industry, apart from the general indirect effect, means a serious loss to the West Kootenay Power & Light Co., which for years has supplied power for this plant, and to the small mine operators accustomed to make shipments of ore to the smelter for treatment, besides throwing many employees out of work. The explanation given by the company is that it is no longer profitable to handle the low-grade ore of the Phoenix mines, because of increased costs, among those things, instances being the increase in the cost of hydro-electric power, increased price of coke and increased railway freight rates.

These mines, it is pointed out, have been operated for some time on an exceedingly narrow margin, it taking 22½ cents per pound to produce a pound of copper from the ores because of the high costs. With the old U.S. Government price of 23½ cents per pound, there was a margin of profit of one cent. The subsequent increase to 26 cents per pound did not make the difference that might have been looked for, owing to the almost simultaneous rise in freight charges, etc.

The operation of the Phoenix Mines began in 1901, when, under the management of the Granby Company, they produced 169,087 tons. In that year the first smelting furnace of 300 tons capacity was completed and produced 8,871 ounces of gold, 34,990 ounces of silver and 5,435,955 pounds of copper. Additions to the smelter were made from time to time until its daily capacity attained 4,500 tons a day. The converter plant was established at Grand Forks in 1902, and its capacity increased in 1909.

The Phoenix Mines have produced up to the end of the last financial year, according to conservative estimates, ore to the value, approximately, of \$55,550,000, or nearly 10 per cent. of the total mineral production of British Columbia up to June 30th, 1917.

Hope has not been abandoned of persuading the Granby company to continue its operations in this district and, in this connection, Mr. J. E. Thompson, member of the local Legislature for Grand Forks, states that the company's plans must not be accepted as contemplating the abandonment of the camp, even temporarily. He asserts that it is most probable that, after affecting some repairs to plant, the industry will be re-established.

The main operations of the Granby company are on the coast. The Hidden Creek mine being a very large producer. The company's smelter at Anyox is making a large output.

NEW ISSUES.

The Department of Finance is circulating a memorandum respecting the regulation of issues of securities and shares under the order in Council of December 22, 1917. It is again pointed out that the provisions of the order apply to the issue of securities and shares under all circumstances, whether offerings are to be made to the public or not, and that no issue can legally be made until the consent of the Minister of Finance has been obtained. Details are to be furnished both as to how the proceeds of the issue will be used and as to how it is proposed to dispose of the securities or shares.

NIPISSING.

In his report to the President and directors of the Nipissing Mining Company Manager Hugh Park says that during the month of August the company mined ore of an estimated value of \$250,737 and shipped products from Nipissing and customs ore of an estimated net value of \$484,978.

"Underground work," says Mr. Park, "continued as heretofore, and some small veins were encountered at 73 shaft and at 96 tunnel. They are sufficiently encouraging to warrant further development. Development on all the 'town' veins was somewhat hampered during the month on account of the aerial tramway line connecting 73 shaft with the low-grade mill being partly destroyed. Several stores situated underneath the tram line were consumed by fire. The line was out of commission for ten days. During that time it was impossible to hoist any ore from 73 shaft, and it was necessary to provide the low-grade mill with tonnage from the township side of the lake. Most of that tonnage was low-grade material. Consequently, the production from both the washing plant and the low-grade mill for the month was decreased. The high-grade mill treated 98 tons and shipped 462,965 fine ounces of silver. The low-grade mill treated 6,890 tons."

KERR LAKE.

During the month of August the Kerr Lake Mining Company produced upwards of one-quarter of a million ounces of silver. This compares with 231,000 ounces in July. With the exception of the month of May, the August record was the highest in the Kerr Lake's history. The company's fiscal year ended August 31st, with a total output for the year of upwards of 2,575,000 ounces.

SHIPPING COPPER ORE FROM TIDEWATER

An extensive programme of development is being carried out on the property of the Tidewater Copper Company, Sidney Inlet, Vancouver Island, according to Mr. W. G. Tanner, vice-president of the company, who has returned from the mines. At present, the old workings are being opened up, and to facilitate shipments a tunnel is being driven through the mountain, while a small railroad is under construction connecting with the bunkers and the wharf. Mr. Tanner reports that a shipment, valued at \$20,000, was made recently to the Tacoma Smelter.

The Tidewater is an old and well-known British Columbia mining property, having been operated first by the late Lieut.-Governor Dwedney and associates. They shipped some 10,000 tons of 4 per cent. copper ore and development carried to the point of uncovering a considerable body of good ore. At that time, however, the price of copper was not high enough to make the property profitable, and it was closed down. Since the outbreak of the war and the consequent increased demand for copper, together with the advance in prices, it again, in common with other mines of similar condition in this province and elsewhere, attracted attention and finally was taken over by its present operators.

The demonstration float arranged by the Hull Iron & Foundries, Ltd., for the Labor Day parade, which showed men actually engaged in pattern-making, moulding, core making and pouring metal, won the cup awarded for the best exhibit in the Ottawa-Hull parade.

BRITISH COLUMBIA INTERESTED IN GOLD CONFERENCE AT SPOKANE.

An invitation was extended Hon. Wm. Sloan, Minister of Mines of British Columbia, to attend an international conference to be held at Spokane, Wash., on the 5th and 6th of September, for the purpose of discussing the world's supply of gold and the best means of stimulating the production of the precious metal in the Northwest. Mr. Sloan expressed his appreciation of the importance of the matter and gave his pledge that the province would be represented at the conference. While the question is one of general interest to the mining fraternity, it perhaps is of special interest to British Columbia, because the Rossland Camp, in years past one of the most stirring of the province, has been practically closed down owing to the steadily declining purchasing power of the dollar and the ever stationary value of gold. The reasons given by the Canadian Consolidated Mining & Smelting Co. for the discontinuance of work at Rossland have been given already in these columns. It may be said, by way of explanation, that the company takes the simple position that the cost of mining—material, labor, etc.—has made the operation of the mines in question unprofitable.

MINING ACTIVITY IN WESTERN BRITISH COLUMBIA.

Mr. W. M. Brewer, Resident Mining Engineer for the Western District of British Columbia, speaks most enthusiastically regarding present conditions in regard to the mining industry in this section of the province. He says that in over twenty years he has never seen the prospect more encouraging. Some of the activities that have come to his attention are thus summarized: The Phelps-Dodge interests have taken bonds on the Fraser Group (East Sooke); the Ladysmith Smelting Corporation has bonded the Willow Grouse, Cowichan Lake; the Ralph Properties are under charge of Mr. Aldrich, New York, ex-manager of the Trail Smelter; and the Sunlock Mines, Jordan River, are being run by Mr. Pat. Stewart for an all-Vancouver Company. In the Alberni Canal region Mr. Samuel Ryder, of St. Albans, England, has installed new bunkers and a compressor plant at the old Monitor mine, which was sold three years ago for taxes. It is reported that a large body of ore has been blocked out. At Quatsino Sound, also Vancouver Island, the Coast Copper Co. is working the Old Sport Group on Elk Lake and plans are said to be under way for a sixteen-mile railroad from the mines to the coast. At Sidney Inlet, the Tidewater Copper Co., of New York, is working on the Indian Chief Group, a former Dwedney holding, and at Knights Inlet the Princess and Union Groups are being operated. Work is proceeding on the Texada Island properties and prospecting forces are working everywhere, particularly on Hervis Inlet.

OPPORTUNITIES

--for--

Prospectors and Mining Companies

The mineral wealth of Northern Ontario is enormous. From a few developed areas a very large output of nickel, copper, silver and gold is being made. Many promising areas are awaiting the prospector and miner.

Recently Northern Manitoba has become an important producer of copper ore, and many promising gold deposits have been located. This is an excellent field for the prospector.

One of the greatest factors in development of mineral areas is the provision of transportation facilities. Railways and the mining industry have together played a very important part in the development of several parts of Canada.

The Canadian Northern Railway, recently constructed across Northern and Western Ontario, has opened up for prospecting a large territory. Easy access to many promising areas is now available. Geological maps of some of these areas can be obtained from the Geological Survey, Ottawa.

The Canadian Northern Railway in Manitoba gives access to the Pas Mineral Area. In Alberta the Canadian Northern is serving important coal fields.

THE DEPARTMENT OF RESOURCES CANADIAN NORTHERN RAILWAY

The Department of Resources, Canadian Northern Railway Building, Toronto, will be pleased to furnish information about the districts served.

Dr. Charles F. Mabery said, in the Journal of Industrial and Engineering Chemistry:

"In the general plan and scope of this work it seems difficult to suggest an improvement. The evident care in its preparation, the statements supported by numerous citations from petroleum literature, and the cooperation of practical experts, are the best assurance of its accuracy."

The first comprehensive and authoritative treatment of the American petroleum industry. The books are distinctly modern in every respect. They cover the chemistry, geology, technology, history and economics of the subject thoroughly. They place at the disposal of engineers, chemists, and students a complete summary of present-day knowledge and practice of the American petroleum industry.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

- Applicants for publications not listed above should mention the precise area concerning which information is desired.
- Maps published within recent years may be had, printed on linen, at the nominal cost of ten cents each.
- The Geological Survey will, under certain limitations, give information and advice upon subjects relating to general and economic geology. Mineral and rock specimens, when accompanied by definite statements of localities, will be examined and their nature reported upon.
- Communications should be addressed to The Director, Geological Survey, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

THE recent decision in the Butte & Superior Suit with Minerals Separation has an important bearing upon the use of the Pneumatic, or Callow method of flotation.

The Appellate Court's decision at Philadelphia, in the Miami case, had already made clear the distinction between (1) froth produced by violent mechanical agitation of the Minerals Separation process, and (2) simple levitation by air bubbles, as practised in the Callow or pneumatic cell, without such agitation.

Now the Appellate Court at San Francisco has interpreted the United States Supreme Court's opinion in the Hyde case, whereby the Minerals Separation Patent was restricted to the use of a minimum, or 'critical' proportion of oil, in combination with violent mechanical agitation.

This latest decision of the Appellate Court in the Butte & Superior case, restricts the Minerals Separation basic patent to the use of a quantity of oil *not in excess of ten pounds (0.5%) per ton of ore, in combination with violent agitation*: it is a logical sequel to the Supreme Court's opinion and confirms the status of the Callow or Pneumatic method of flotation as distinct from the agitation-froth process.

Both the use (1) of oil in excess of ten pounds (0.5%) in combination with violent agitation, and (2) the use of the Callow system of aeration with any quantity of oil, appear therefore to be immune from any charge of infringement.

(Signed) J. M. CALLOW

SERVICE

The Technical Division of Canadian Explosives, Limited, is not merely organized to increase the sale of explosives. It is their function to assist and advise regarding the blasting operations of any concern having "explosive" difficulties, and if need be, stay on the job and direct the work until the trouble is removed.

The Technical Division is equipped to take care of the most difficult blasting problems. Every man is an expert, experienced in actual work.

Put your blasting difficulties up to us.

“HISCO” means QUALITY

ARE you using “HISCO” Products? If not, why not? We SPECIALIZE in mining machinery parts. Mill linings, balls, stamp shoes, dies, crushing plates and all parts where extraordinary wear is required our special “Chromnic” steel will stand the test. It is being used in mining operations from coast to coast and giving entire satisfaction.

“CHROMNIC” costs less and wears longer.

Why not give “Chromnic” a trial? Once used always used. Prompt delivery assured.

Managers and Men Both Like the DR 6

Sullivan DR-6 Water Jet hammer drills enjoy a popularity as all-around mining drills that is not confined to any one section of the country or to any one kind of ground. Their speed, economy and convenience make friends everywhere.

DR-6 Users Come back for more

The other day a big lead mine sent us an order for a lot of DR-6 drills. It was their third large purchase of DR-6's in two years.

They were hard to convince at first, and they're the kind of people who know their own business.

But a trial "DR-6" "showed" them, and when drills are needed, they come back for more "DR-6's."

The low repair costs and drilling speed of the "DR-6" help operators to keep down costs and keep up tonnage.

Runners Prefer "DR-6's"

A Canadian Mine Superintendent writes:

"We have four—machines for sale. We cannot get the men to use them now we have the Sullivan "DR-6" machines in the mine. All the men want Sullivans."

Easy steel changes, single throttle for air and water, smooth action, are reasons for DR-6 popularity with runners.

If You Need More Drills, Try "DR-6"

"New Cleveland"

The Drill that gives Super-Service

Owners of the "New Cleveland"—and there are hundreds of them in the different mining centres of Canada—do not know what drill trouble means. From the beginning to the end of the season they stay on the job **continually**, as their solid construction requires no repairs.

They use less air and operate more smoothly than other drills, and the speed and power of the blow enables the runner to break previous records.

This means increased output at a lower cost of production, and with less labor required—a vital consideration these war times.

Use a "New Cleveland" on your job this season and put the "pleasure punch" in your work.

Write for Bulletin No. 35-A, which fully describes the "New Cleveland" Type S Stoper.

WHY WASTE COAL WHEN IT COSTS SO MUCH?

**The Cochrane Metering Heater tells how
much you are getting for your money**

How many pounds of coal do you use to produce a thousand pounds of steam?
200, 150, 100 or less?

A Cochrane Metering Heater will tell how many pounds of water are evaporated per pound of coal, and it will instantly show any improvement in evaporation due to better fuel, better methods of firing, better condition of heating surfaces (removal of soot and scale), better condition of boiler setting (stopping up air leaks), etc.

CANADIAN ALLIS-CHALMERS
LIMITED

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping. Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - **Halifax, N. S.**

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,116,103; Lode Gold, \$93,717,974; Silver, \$43,623,761; Lead, \$39,366,144; Copper, \$130,597,620; Other Metals (Zinc, Iron, etc.), \$10,933,466; Coal and Coke, \$174,313,658; Building Stone, Brick, Cement, etc., \$27,902,381; making its Mineral Production to the end of 1917 show an

Aggregate Value of \$595,571,107

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392.

Production During last ten years, \$296,044,925

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

WILFLEY TABLES

AT THE NEVADA CONSOLIDATED
COPPER COMPANYLatest Model
No. 6 Wilfley Table

Wilfley Tables were used at this plant for many years, and when 84 additional double-deck tables were required for increasing capacity—there was but one choice—*Wilfley Tables*.

During the past 20 years more than 22,000 *Wilfley Tables* have been built, and more of them are being purchased today than ever before.

The universal popularity of *Wilfley Tables* is due to the following reasons;

Highest efficiency in metallurgical extraction—

Great capacity—Mechanical perfection—

Extreme simplicity of construction.

The *Wilfley* will recover the biggest percentage of values from your ores, and do it at the lowest cost.

Write us about
your concentra-
ting problems—
our engineers

THE CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO, October 1st, 1918.

No. 19

The Canadian Mining Journal

With which is incorporated the
"CANADIAN MINING REVIEW"

Devoted to Mining, Metallurgy and Allied Industries in Canada.

Published 1st and 15th of each month by the
MINES PUBLISHING CO., LIMITED

Head Office - - - - 263-5 Adelaide Street, West, Toronto
Branch Office - - - - 600 Read Bldg., Montreal

Editor: REGINALD E. HORE, B.A. (Toronto).

SUBSCRIPTIONS.

Payable in advance, \$2.00 a year of 24 numbers, including postage in Canada. In all other countries, including postage, \$3.00 a year.

Single copies of current issue, 15 cents. Single copies of other than current issue, 25 cents.

The Mines Publishing Co. aims to serve the mining industry of Canada by publication of reliable news and technical articles. This company publishes the Canadian Mining Journal twice a month and the Canadian Mining Manual once a year.

ADVERTISING COPY.

Advertising copy should reach the Toronto Office by the 8th for issues of the 15th of each month, and by the 23rd for the issues of the first of the following month. If proof is required, the copy should be sent so that the accepted proof will reach the Toronto Office by the above dates.

ADVERTISING.

The Canadian Mining Journal covers the Canadian mining field. Ask for advertising rates.

CIRCULATION.

"Entered as second-class matter, April 23rd, 1908, at the post office at Buffalo, N.Y., under the Act of Congress of March 3rd, 1879."

SIXTEEN MINERS KILLED AT NANAIMO.

Sixteen miners lost their lives on the morning of Tuesday, September 10th, when the cage in which they were descending the Protection Island Shaft of the Canadian Western Fuel Co.'s Mine, Nanaimo, B.C., became detached from its cable and fell a distance of approximately 300 feet. The cage had raised all the men of the night shift to the surface and carried six loads of sixteen down when the accident happened. It had scarcely left on its seventh trip when the cable parted, the miners still waiting their turn being informed of what had taken place by seeing the parted cable, released of its load, swinging loose in the shaft. Subsequently it developed that the safety locks had failed to act and that the cage had struck the loading landing, constructed of twelve-inch timbers, with such force that it went through, finally resting 50 feet lower on an abandoned level not used since the upper seam was opened some years ago.

This is the most serious coal mine disaster that has occurred in British Columbia since early in the month of April, 1917, when 34 miners lost their lives in an explosion at the Coal Creek Mines, Crows Nest Pass Colliery, Fernie. Hon. Wm. Sloan, Minister of Mines, has promised that the fullest investigation will be made in order that the responsibility may be fixed.

NO MORE CHEAP COAL

Having in mind the great need for increasing production of coal, it is distressing to learn that miners are idle in coal mining districts in Nova Scotia and British Columbia. In view of the high cost of living, it is natural to expect that high wages must be paid, and it is not surprising that some workers are ready to take advantage of the shortage of labor to demand higher wages than the conditions warrant. It is regrettable that in Pictou and Fernie valuable time has been lost by the men going on strike and showing an unwillingness to do their part towards keeping production of coal from falling below the already disappointing level. Coal miners, or any other men, who quit at this time, when so much depends on the maintaining of the output of munitions of war, need not be surprised if their actions bring public disfavor.

We are pleased to learn as we go to press that the Pictou miners have agreed to return to work, and we hope that the miners in the Fernie district will soon find it possible to do likewise. We have no doubt that the majority of miners on strike regret that they have given the public such a bad impression by their action.

There can be little doubt that coal miners have been justified in asking for higher wages than they received a few years ago. They are now, however, receiving much higher wages. We believe that coal miners deserve higher wages for their hard and dangerous work than workmen who have easier and safer occupations and we hope that the very low wages of pre-war days will never return. We have, however, little sympathy for the men who seek to take advantage of present conditions to force, by strikes, unreasonably high wages regardless of the effect of their action on the war effort.

The low wages that prevailed in coal mining regions in former years were largely due to the low prices at which coal has been sold. We believe that investigation will show that coal has for years been selling at too low a price in North America. The men who mine the coal deserve more than they have received for their labor, and the men who supplied the money for the industry deserve more than they have received for the use of the money. The capital invested in mines and plants is very large and the dividends small. Consequently, the industry has been unable to give high wages to miners. The whole matter needs adjustment and it looks as though adjustment may come soon. Undoubtedly the public will have to pay more for coal than in the pre-war days.

One natural result of higher price for coal will be higher wages to coal miners. Another good result will be more complete utilization of our water powers. Both are things much to be desired.

A Possible New Fuel Oil Industry for Canada

By James Ashworth.

For quite a number of years a small coalfield has been known to exist about fifty miles north of Kamloops. It was visited and reported on by Dr. Dawson, who stated that the seams were too thin for operation. The exposures so far discovered are all at Chu Chua in one creek called Coal Creek. Since Dr. Dawson's visit, another seam of coal of workable thickness has been discovered, and to some extent worked. The coal, when tested on the Canadian Pacific Railway, was reported as having given very satisfactory results. At that time, there was no railway transit to and from Chu Chua, but now the Canadian Northern Pacific Railway passes through the district and through the coalfield. A workable seam of cannel coal has also been discovered, but never opened up. Later still, another seam of coal has been disclosed by a freshet, and will doubtless receive attention from one of the syndicates which have been formed to test the possibilities of the coalfield. The coal previously worked proved to be of a hard bituminous and coking quality, though at present it is not known whether the coke will be sufficiently hard for metallurgical purposes.

Cannel coal is also known in the Crow's Nest Pass coalfields and oil shales will probably be found when they are systematically looked for.

As a consequence of the excessive demand for mineral oil for war purposes, the ordinary sources of supply have proved insufficient to meet the demands of the market, and, therefore, other sources must be energetically prospected. One other source, which is receiving close attention in Great Britain and the United States to-day, is to extract oil from cannels, bastard cannels, shales, torbanites, blackband ironstone, coal, lignites and peats. In Scotland, large tonnages of oil shale have been and are being converted into fuel oil and for other purposes. The fuel oil yield is not more than 60 per cent. of the total yield of, say, 20-30 gallons per ton. Very few cannels yield as much as 50 gallons of oil per ton, but many of them will produce 40, and some of the Utah shales as much as 80 gallons per ton. The yield of sulphate of ammonium is very considerable, and may, with high-temperature carbonization, reach 60 lbs. per ton of cannel. Paraffin wax may also be extracted.

Experiments made on coal for the Nitrogen Products and Carbide Co. in Lancashire, with the Glover-West vertical retorts, showed that if 4.2 tons per 24 hours were put through at a temperature of 1,411 degrees Cent., and 2.6 tons per 24 hours, at a temperature of 1,194 degrees Cent., that more tar oil was produced per ton at the lower temperature. Good cannels should, therefore, be treated for oil in low temperature retorts.

At a meeting of the Manchester Geological Society, on the 12th of March, a paper was read by Mr. J. Drummond Paton, on the recovery and use for oil and power purposes from wastes, shale and lower grades of coal. The process advocated was to carbonize the coal, cannel, shale, etc., in a short period of time, so that the lighter gaseous hydrocarbons (which condensed as tar oils) were not destroyed by a high temperature. The apparatus used was the Tozer concentric retort, working under a high vacuum of 20 inches of mercury. Carbonization was perfected in four hours. The crude oils (water free) varied from 16 to 80 gallons per ton of

coal carbonized. The purified oils were of the paraffinoid series, and the light oils were excellent for motor spirit and resembled petrol in their efficacy.

Napthalene and anthracene were entirely absent. The tar acids were practically phenols and cresylic acids, and were produced at temperatures of from 900 deg. to 1,200 deg. Fahr.

The yield of gas was from 5,000 to 6,000 cubic feet per ton, and its heating value about 800 B.T.U. per cubic foot. The cannel gave 6,000 to 8,000 cubic feet of gas per ton. The residual coke retained from 7 to 10 per cent. of a volatile inflammable non-smoking gas, which burned with a lambent, smokeless flame, yielding great heat, with an approximate calorific value of 13 500 B.T.U.'s per cubic foot.

Very inferior coals yielded good fuel results, but for a high yield of oil, cannels and shales were certainly preferable.

It was found that a thickness of 2½ inches in the retorts was the best basis for carbonization. The same material which gave the low temperature distillates also gave the benzoid series.

The United States Department of Mines has made a practical search for oil shales, and their development and conversion into oil is now practically established.

It is important, therefore, to note the difference between coal and cannel coal and between these and oil shales—the first when of a bituminous quality will usually produce good coke as one of its residuals, but cannel and the oil shales do not produce a metallurgical coke, though the residue of some of them may be used to heat retorts and stoves. Cannel coal and oil shales were, before the discovery of petroleum, largely used as the source of mineral oil.

Cannel coal being the resultant of the oxidation of water-laid deposits consists mainly of plant spores, pollen and the remains of water plants, animals and fish. As a source of oil, the cannel which contains the least water and the highest percentage of hydro carbons is the most desirable.

It is recognizable by its velvety appearance and its peculiar conchoidal fracture, is jointy and hard, does not blacken the hands, and is almost immune from weather effects. In the best cannel, the fixed carbon is much less in percentage than the volatile content. Cannel deposits, having been collected and formed in basins or lagoons, are not so regular in formation as is coal, and yet cannel and coal may be found in close contact and as part of the same seam. The illuminating value of gas made from cannel is greater than that made from coal, and the yield of oil per ton is also very much greater. One high-class cannel in the Wigan Coalfield, England, is known as Curley or Birds-eye Cannel, from its peculiar fracture. In the shales overlying cannel it is often possible, when the shale weathers and splits into thin sheets, to find very interesting fish remains.

Cannel coal, when scratched, gives a brown streak and its specific gravity being lower than coal, it naturally results that the lighter it is, the more valuable it becomes.

When examined under the microscope, it shows that plant spore cases and waxy resinous matter are its main constituents. Where the seam has been changed

into coal, we may assume that originally a larger percentage of water-growing plants or bog had accumulated. Naturally, it results from this mode of deposition that basins of cannel coal are found to be very irregular in area and thickness, and also as frequently occurs, they are overlaid by bituminous coal of a more regular thickness.

In Great Britain, two official reports of committees appointed to deal with the question of home sources of fuel oil have recently been issued. These were (1) that of the committee appointed by the Ministry of Munitions of War on the "Production of Oil from Home Resources," and (2) that of the "Interim Report of the Committee on the Production of Oil from Cannel Coal and Allied Minerals," appointed by the Council of the Institution of Petroleum Technologists.

The summary of the conclusions of the first of the above committees was as follows:—

"(1) That the scheme for the carbonization of cannel coal and kindred substances recommended in the Petroleum Research Department's report was not a practicable one, and that the Ministry of Munitions were justified in declining to embark on it. (2) That the alternative policy of developing the production of fuel oil from cannel coal and kindred substances in existing vertical retorts at gas-works should be developed within the limits indicated in this report. (3) That the decision of the Ministry of Munitions to erect a battery of the Chiswick form of retorts was the right course to adopt in the circumstances."

The possibility of obtaining oil in quantity from the low temperature distillation of cannel coal and its cognates was considered by the second of the above-named committees under the following heads: (1) As an immediate war measure, having in view the production of motor spirit and fuel oil for the services; (2) As a permanent commercial undertaking and a measure of reconstruction.

They now strongly urge the adoption of the following recommendations:—

"(1) That the War Cabinet should be invited to lay down a definite policy for the guidance of the Departments as to the relative national value and importance at the present time of oil and coal, the provision of the necessary labor, raw materials and transport. (2) That the Government should afford all necessary facilities to those who are prepared to find the capital and take the risk for the erection at suitable centres of plant for the treatment on a commercial basis of the material known to exist. (3) That an experimental station be established forthwith, so that retorts of any design provisionally approved by the Institution of Petroleum Technologists can be erected and tried out, and material tested with a view to ascertaining its character, oil yield and residual values. (4) That such experimental station shall be maintained by and at the expense of the Government. Or, alternatively, (5) That the Government shall afford all necessary and reasonable facilities to the Institution of Petroleum Technologists for the erection of a testing station of their own."

In reviewing the above-named reports, the Iron and Coal Trades Review, of London, England, August 9th, 1918, says:—

"From the point of view of the coalowner and the miner, the statements contained in Clause 7 are of considerable interest. Various estimates have been made from time to time as to the additional amount of material which could be brought up by the utiliza-

tion of the shovel, instead of the fork, and perhaps to say 15 per cent. would not be too high. If, therefore, the nation could be provided with a sure supply of oil by bringing up this material, the miner be paid for filling, and the colliery owner obtain a remunerative price for such material for the production of oil, it is quite obvious that the consent of the Government to the recommendations of the Committee would be of the greatest national importance, not only to the consumer, but to those directly and indirectly associated with the mining industry of the country. The question of the utilization of colliery waste is one which has for long been under consideration, and this solution, advocated by some of the highest technical authorities in the country, is one which should receive the general support, not only of those responsible for the provision of oil, but of the colliery owner and the miner.

Now that we have the two reports side by side, one more or less of a political character and the other signed by a committee of experts, it is interesting to recall that the Fuel Research Board (Sir George Beilby, director), which issued its report on September 10th, 1917, finds that "no new carbonization scheme can be justified economically, if it can only live by poaching on the preserves of the existing industries."

The stress of war conditions is now being brought to the attention of the general public, through the shortness of gasoline, and fuel oil, and the consequent closure of garages and stoppage of their use on Sundays. It is also evident in the replacement of fuel oil by coal and coal dust, both ashore and at sea. These indications of "want" cannot be lost sight of, but they do not appear to have received any practical attention from the Scientific and Industrial Research Board. This Board does, however, appear to have taken a distinct interest in the production of an anthracitic briquette, from the lignite coals of Saskatchewan, and in this way some of the residuals may do something to relieve the urgent demand for oil. There is, however, the possibility that this proposal will not come into practical effect until the war is over, and the urgent demand for mineral oils and spirit has become a thing of the past. If the expensive experimental plant to be erected by the Provinces of Saskatchewan and Manitoba, does not prove successful, in competition with the real anthracitic coals of Alberta, then it may prove to be useful and profitable as a means of treating oil shales, if these can be discovered within a reasonable distance of the works.

Canada has become used to a "bonus" system to encourage the introduction of new industries, and the present seems to be a suitable time to further extend this system to encourage the production of oil and other by-products from coal and oil shales, as has already been recently done by the Province of British Columbia as regards iron and steel.

The discovery of manganese ore in the Cowichan district, Vancouver Island, promises to prove of considerable importance to this section of British Columbia and, more important, to provide quantities of that essential mineral for munition manufacture in Canada. Samples treated by the Provincial Mineralogist are said to indicate the presence of ore of just the character that is so much required. A Vancouver, B.C., firm's certificate shows 46.20 manganese, 26.92 silica, and 0.064 phosphorus, while a Seattle assay reads: Manganese 54 per cent., and silica 18.4 per cent.

THE LABOR TROUBLE AT FERNIE.

At the time of writing, September 21st, there are on strike in the Fernie coal district, British Columbia, about 1,200 miners, who are demanding that the single-shift system be introduced in the operation of the mines of the Crow's Nest Pass Collieries. Their action is based on the statement that recent "bumps" in the mines of the locality, while without fatal result very recently, have demonstrated that the lives of the men are in constant jeopardy. The only remedy, they contend, is the introduction of the single shift. In support of their position, they point to the report and recommendations of Prof. George S. Rice, of the United States Bureau of Mines, who made an inspection and submitted a report on conditions in this district for the British Columbia Government.

The walk-out, which affects all the mines of Fernie and Michel, B.C., came suddenly, although there had been talk and agitation for some time before it happened. An understanding, however, had been reached between representatives of District 18, U.M.W. of A. (which includes the eastern section of British Columbia and a part of the Province of Alberta) and Mr. W. R. Wilson, general manager of the Crow's Nest Pass Coal Co., that no drastic step would be taken by the men until the 1st of October, Mr. Wilson promising that he would have his answer by that date as to what course the company would be prepared to take with respect to their demand. The Fernie Union did not consider itself bound by this agreement, however, and declared a strike on September 5th, and called on the district organization for support.

After some preliminary negotiation, which was without result, a conference was arranged to take place in Vancouver, B.C., between Hon. William Sloan, Minister of Mines for British Columbia; Mr. W. H. Armstrong, Director of Coal Operations in District 18; and representatives of the men, the latter including Mr. Thomas Biggs, President of District 18, U.M.W. of A.; Edward Brown, Secretary-Treasurer of the District Organization; and Messrs. Hunter, Potter and Beard. This took place between the 18th and 20th instant, both dates inclusive, all those mentioned attending, with the exception of Mr. Wilson, general manager for the Collieries, who, while in the city, refused to meet the men, maintaining that they had broken faith with him and that, therefore, he did not care to discuss the matter with them in person.

In the course of the conference, Mr. George Wilkinson, Chief Inspector of Mines, was called and gave an account of the steps taken since the submission of Prof. Rice's report for safeguarding the mines against further accident. A more thorough ventilation system had been introduced, with the result that analyses of the air in the return airways showed a reduction of the percentage of methane of from 25 to 75 per cent. Automatic gas detectors of the type approved by the United States Bureau of Mines had been installed and these had detected gas in as small quantities as one-tenth of 1 per cent. The old safety-lamp tests were merely guess work below 2 per cent., so that the automatic detectors were a marked improvement. The company also had agreed not to take out more than 15 per cent. of the coal in the first working, leaving the remainder to be recovered in retreat operations. Coal dust was

being treated by sprinkling and by covering with flue dust.

The men did not dispute the assertion that conditions were much better than formerly, in fact, it was admitted that the improvements indicated had taken place. They insisted, however, that what had been done had not eliminated the "bumps" and declared that this danger could only be met by doing away with the double shift. In the ensuing discussion, doubt was expressed as to whether the single shift, even if secured, would do away with "bumps," which were seismic disturbances peculiar to the Crow's Nest Pass coal field. It was further stated that, in order that warning might be obtained of such movements, a seismograph station was to be installed at Fernie by Mr. F. Napier Denison, the official seismographer for the Dominion Government at Victoria, B.C.

All apparent means of a solution having been exhausted, Mr. Sloan, the Minister of Mines, submitted the following as a basis for settlement on his own responsibility:

"In the interest of the industry and for the purpose of arriving at a quick decision so as to enable the much-needed output of coal to be maintained, I make the following proposals to the miners now idle and to the company involved:

"1. The immediate appointment under authority contained in Section 73 of the Coal Mines Regulation Act of a Commission composed of three members, one chosen by the miners and one by the operators and the third to be appointed by the Lieut.-Governor in Council, on the recommendation of the Minister of Mines, this Commission to immediately proceed to take evidence on the questions involved insofar as they affect any or all mines in Coal Creek and Michel and to be prepared to report within thirty days of their appointment to the Lieut.-Governor in Council, whether, in their opinion, the single shift would be advisable in any or all the mines in said area. The recommendations of this Commission, if any, to be binding on both operators and men until the conclusion of the war.

"2. If the above proposal is satisfactory, I will be prepared, as Minister of Mines, to introduce, at the next session of the Legislature, an amendment to the Coal Mines Regulation Act, calling for one shift in every twenty-four hours for the production of coal throughout the Province of British Columbia, except in cases of national emergency. This amendment to become effective within one year after the conclusion of the war."

This was submitted to Mr. Wilson, the company manager, and accepted, but when it was put to a mass meeting of the miners on strike at Fernie and Michel, was rejected unanimously.

Messrs. Biggs, President of the U.M.W. of A., and Brown, its secretary-treasurer, then submitted a counter proposition to the effect that they would be willing to recommend to the men of the affected section that they return to work on condition that they be given the single shift for the thirty days which would be occupied in the investigation and the preparation of a report by the Commission proposed.

This suggestion has been laid before Mr. Wilson, and it is hoped will be accepted, as the continued inactivity of the miners of the Crow's Nest field, and the possibility of the strike extending throughout the whole district, thus taking some 9,000 miners from work, is causing considerable alarm throughout Canada.

THE HOISTING ACCIDENT AT NANAIMO.

In order that necessary tests may be made to determine the cause of the breaking of the cable used for the lowering and hoisting of men in the protection shaft of the Canadian Western Fuel Co., Nanaimo, B.C., which took place on the morning of the 10th September, with the result that sixteen miners were plunged to their deaths, the inquest was adjourned by Coroner Hickling last Friday evening to the 22nd October. Meanwhile, Wm. Fleet Robertson, Provincial Mineralogist, having been sworn as an official of the Court, will take the broken cable to Eastern Canadian laboratories to supervise "critical microscopic and chemical" examinations and tests of the same. He also is taking samples of water taken from the flow in the shaft, which he will have analyzed to ascertain whether it contains any deleterious matter likely to cause corrosion or other deterioration of the cable and, besides, has been given samples of the oil used in lubricating the rope, which will be treated with the same object. Mr. Robertson will have tests made of the springs used in the operation of the safety clutches, with which the shaft was equipped and which failed in their purpose, the cage, freed of the cable, having travelled unchecked to the bottom.

The inquest, which opened at Nanaimo on the morning of Thursday, the 12th instant, the disaster having occurred on the morning of the 10th, was marked by a clear indication on the part of the authorities to bring out all the evidence, without fear or favor, which might be relevant. Examination of witnesses was conducted by Mr. A. Johnson, Deputy Attorney-General, assisted by Mr. George Wilkinson, Chief Inspector of Mines, while the interest of the Government and of the Department of Mines in particular in seeing that the inquiry should be as thorough as possible, was indicated by the fact that Hon. Wm. Sloan, Minister of Mines, was present in person throughout, and frequently took part in the cross-examination of those called upon to testify. Mr. Johnson, at the outset, declared that he was in attendance, with instructions to have all light that could be obtained shed on the circumstances attending the fatality. With that in mind, he had to ask that the inquest be made as broad as was reasonable in its scope and he hoped that, if there were within hearing any who knew anything that might strike them as being of any importance, they would not hesitate to mention it to him, in order that it might be put on record.

The work of taking testimony then commenced, the scene of the fatality at the bottom of Protection shaft having been visited by the jurors, who had been sworn in on the 10th, within a few hours after it happened. This was continued throughout Thursday and Friday, with an interval on the afternoon of the first-mentioned day, when the funeral took place, it being attended by Hon. Mr. Sloan and other Government and company officials. In all, fifty witnesses were called and examined before adjournment.

James Menzies, rope expert, who is employed by the Canadian Western Fuel Company to make examination at regular intervals of all cables in use in the company's mines, was one of the chief witnesses. He informed the court that he made an inspection of the cables once a week. His last inspection of that which broke was on the 4th of September. On that occasion, as at all times, the cable had been paid out and had

passed through his closely gripped hand for its full length. If there had been any broken strands then they must have been noted either when they struck his flesh or by his eye. He also said that his practice was to inspect the safety clutches and these also, on his last visit, had been in good working order.

Another important witness was C. Wallbank, who, until the 28th of August, was employed by the company to make the daily inspection of cables, etc., required under the terms of Section 91, General Rule 36, of the Coal Mines Regulation Act. On the date indicated, he had left the service of the company. Up to that time he had made the daily inspection required and filed the necessary report. He had never found anything wrong with the rope in question. It appeared, from the evidence of C. Nicholson, that the latter took Mr. Wallbank's place. The former swore that he had inspected the cable and cage, but, on cross-examination, it was found that this inspection was only of fifty feet of the cable from the cage, whereas his daily report would lead to the belief that it extended over its full length.

S. Tembey, the engineer in charge of the operation of the hoisting machinery at the time of the break, swore that he was not using steam or brakes at the moment the cable gave way. Further testimony on this point was given by Wm. Woodman, an engineer of some thirty years' experience, who said that as the rope had broken 157 ft. from the cage and as the shaft is 650 ft. in depth, the cage, when it was let loose, was only approximately one-quarter down, or had travelled but a short part of the trip. He argued from this that there was no need for the application of the brakes; neither he nor any other engineer, would find it necessary at that point to use brakes. This was of importance, it may be explained, because of the possible theory that the snap was the result of the sudden application or restraint on the descending load.

Inspector of Mines, J. Newton, took the stand, but merely stated that he was on his way to make an inspection of the mine from protection shaft on the morning of the accident. He inspected once a month. His practice was, first, to go to the records to find out whether all the required entries had been made. If these showed that the ropes had been inspected as necessary by Statute, they would be accepted by him as accurate.

In the course of the Friday afternoon session, Deputy Attorney Johnson obtained an admission from Mr. Woodman that the latter had heard complaints from the men as to the methods of one of the other engineers in lowering the cage at protection. It had been stated that the miners at times became indignant at the jerky manner in which they were lowered. Mr. Johnson insisted that the witness give the names of the miners who had made these statements; but Mr. Woodman declared that it was unfair that he should be required to give hearsay evidence. It was explained by Mr. Johnson that what he wanted was to secure such information as would enable him to call the men in question. Witness then said that some of them were in Court, and asked them to declare themselves. One did so, but there were no further volunteers. On the suggestion of Mr. Sloan, the doors were closed and all miners who descended Protection shaft present were put on the stand and sworn. From some of these, it was established that there were complaints from time to time because of the jolting of the cage, in some instances, it being stated that it was so roughly

handled that the men were almost thrown off their feet.

Before adjournment, Mr. Fleet Robertson was sworn and charged by Coroner Hickling as follows:

"I hand to you Exhibit 7, which is a bottle of water taken from the shaft of the Protection Mine, under the supervision of Mr. Devlin, acting for the Government, and Mr. Garman, acting for the company. I ask you to take this to Montreal and have it analysed and see whether it contains any deleterious matter which would be liable to affect the strength of the cable. I will ask you to be present at the examination of this water and to bring the results of the examination and any unused portion of the water back with you, when you are next called upon to give evidence at this inquest.

"I also hand to you Exhibit No. 9, which is a sample of oil used by the Canadian Western Fuel Co. for oiling the rope attached to the cage in question." Mr. Robertson then was requested to take this to Montreal, that the same tests might be made for the same purpose.

"These are some parts of cable," the Coroner continued, "which I give into your possession. You will take these to McGill University, Montreal, or some other institution with the necessary laboratory equipment, for the purpose of having the same tested and a critical chemical and microscopic examination made of the fractured ends, in order to ascertain, if possible, what caused the rope to break. It will be necessary to obtain an exhaustive examination of this rope to know whether its efficiency had been impaired in any way, and, if so, to ascertain the cause of such impairment, and I request that the ropes be subjected to all practical strains and tests, in order to arrive at your conclusion. I would ask you to attend at these tests.

"Another exhibit, being the springs attached to the clutches in question on the 10th of September, will be placed in your charge for testing, but these have been unavoidably detained at the bottom of the shaft and will come into my possession to-morrow, when they will be given you. I would ask you to be good enough to take these springs and have them tested, in order to ascertain whether or not their efficiency has been impaired.

"And now, Mr. Robertson, I fully realize the responsibility I am imposing on you, knowing the important position you have with regard to the Provincial Government, and I know that you will fulfill the duties I impose upon you to the best of your skill and knowledge, and that you will in due course return with the results of the investigation when you are next called upon to give evidence at this inquest."

License Needed for the Export of Silver.

Export of Canadian silver coin, silver bullion and fine silver bars is prohibited except under license issued by the Minister of Finance, according to Ottawa advice. The regulations are to provide that licenses shall be issued only where the silver is to be used for civil or military purposes of importance in connection with the war and only in cases where the exporter certifies that it has been purchased at a price which does not directly or indirectly exceed \$1.01½ per ounce, 1,000 fine, at the point where the silver is refined or at the point of importation in the case of imported silver. The order-in-council states that serious difficulties have arisen in connection with the purchase of silver which is urgently required for coinage by the allied governments and recites the steps taken by the United States and British Governments.

THE E. & N. RAILWAY CO.'S LANDS, VANCOUVER ISLAND, B.C.

The question of the joint administration of all minerals in the E. & N. Railway Co.'s lands on Vancouver Island, with the exception of gold and silver, which alone are vested solely in the Province, was taken up with Lord Shaughnessy, President of the Canadian Pacific Ry. Co., by Hon. William Sloan, Minister of Mines, at Vancouver, B.C., on Thursday, the 19th instant, with results which Mr. Sloan considers very satisfactory.

Mr. Sloan found that the President of Canada's great railway corporation was thoroughly conversant with the situation and that he was prepared to agree with the position taken by the Department of Mines, and unanimously endorsed by the Legislature of British Columbia at its last session, that the present system of mineral control within the area owned by the Island Railway was most satisfactory from a public standpoint.

With Lord Shaughnessy, the Minister of Mines reviewed the situation, pointing out that, because of the existing dual control, the development of the mineral resources of the 3,296.9 square miles of railway land on the Island was being seriously retarded. He emphasized the fact that, owing to the complications likely to arise in the securing of title to minerals other than gold and silver in this section, prospectors were not inclined to go into the field within its limits. The difficulties were aggravated, it was pointed out, by the fact that where gold and silver was discovered on the Island, the ore usually, in fact almost invariably, contained other minerals. For the encouragement of prospecting in the E. & N. Belt, and in the interests of the mining industry of this part of the Province, therefore, it was desirable that there should be some understanding between the Province and the Railway Company as to the development of resources known to exist, but hitherto practically untouched in an economical sense.

Lord Shaughnessy listened to these representations sympathetically and admitted that the situation was not desirable. He intimated that officials of the company would be deputed to enter into negotiations with Mr. Sloan, having in view the arriving at a decision which would be mutually satisfactory.

At the recent annual meeting of the Rambler-Cariboo Mining Co., one of the producing mines of the Slocan District, British Columbia, it was stated by Mr. A. P. McClaine, president, that the company had a surplus of \$29,120 on August 3, and that the ore at the smelter, in transit and ready for shipment by September, is valued at \$21,000. He continued: "We have found little clean ore in our recent operations, so that the output next year is likely to be confined mainly to ore of a milling grade. We have been able to operate the mill on a basis of only a shift a day because of the shortage of mill men and, under these circumstances, the profits have been light, running about \$2,000 a month. We are trying to buy a locomotive for the transportation of men and materials in the tunnel. Speed in transportation has become an essential since the hours of labor are limited to eight hours from portal to portal. Mr. McClaine was re-elected president; Mr. Alfred Coolidge, secretary-treasurer; W. A. Cameron, superintendent; while the Board is composed of the foregoing together with Messrs. H. Coldwell, Jackson Armstrong, Charles F. Mackenzie and the Rev. P. F. Hylebos and Dr. J. F. Hall.

Mineral Production of British Columbia

By E. Jacobs.

The Annual Report of the Minister of Mines for British Columbia for the calendar year 1917, issued recently, includes the revised figures of mineral production in that Province for that year.

In the review that follows the figures showing quantities of minerals produced, rather than those of value, are used, so that the actual production of minerals may be given prominence rather than that of value, the latter being subject to fluctuations of prices and so not constituting as fair a basis for comparison.

An instance of the way in which comparisons of value only fail to convey a fair idea of the relative importance of the actual production of minerals in different years may be found in the first paragraph of official comment under the head of Progress of Mining, in the Annual Report under notice. That paragraph reads: "The gross value of the mineral production for 1917 was \$37,010,392, a decrease from that of the year 1916 of \$5,280,070, or 12.5 per cent., but an increase over that of the previous year 1912 of \$4,569,592, or 14 per cent. The gross value of the metallic minerals recovered in 1917 was \$27,284,474, which represents a decrease from last year of \$4,779,040, a percentage decrease of about 15 per cent."

larger than in 1917 in all but copper and zinc. The comparison between production in 1916 and 1917 is also fairly shown. It may be added that had the same prices been used in calculating the value of the production of 1917 as were used for that of 1912 there would have been a difference of more than \$4,500,000 in favor of 1912 instead of, approximately, that sum against the earlier year, which suggests that comparisons of yearly results with fluctuating value are not reliable as indicating progress or the reverse, while the use of quantities shows much better the actual position. Accordingly, wherever practicable, quantities are used in making comparisons that follow, which cover a total of twenty years, in 4-year periods (taking Table IX of the Annual Report as an example of a 4-year comparison), and, as well, give opportunity to compare earlier periods of similar length with that affected directly by the War.

Details of production (quantities and value) for the four years, 1914-1917, are given in the next following table:

Placer Gold.—The yield of placer gold in 1917 was the smallest for any year since 1911, when it was 21,300 oz., as compared with 24,800 oz. in 1917. That

QUANTITIES AND VALUE OF MINERAL PRODUCTS FOR 1914, 1915, 1916 and 1917

	1914		1915		1916		1917	
	Quantity	Value	Quantity	Value	Quantity	Value	Quantity	Value
Gold, placer.....oz.	28,250	565,000	38,500	\$770,000	29,025	\$ 580,500	24,800	\$496,000
Gold, lode.....oz.	247,170	5,109,004	250,021	5,167,934	221,932	4,587,334	114,523	2,367,190
Total gold.....		\$5,674,004		\$5,937,934		\$5,167,834		\$2,863,190
Silver.....oz.	3,602,180	1,876,736	3,366,506	1,588,991	3,301,923	2,059,739	2,929,216	2,265,749
Lead.....lb.	50,625,048	1,771,877	46,503,590	1,939,200	48,727,516	3,007,462	37,307,465	2,951,020
Copper.....lb.	45,009,699	6,121,319	56,918,405	9,835,500	65,369,364	17,784,494	59,007,565	16,038,256
Zinc.....lb.	7,866,467	346,125	12,982,440	1,460,524	37,168,980	4,043,985	41,848,513	3,166,259
Total value, metalliferous.....		\$15,790,061		\$20,762,149		\$32,063,514		\$27,284,474
Coal.....tons, 2,240 lb.	1,810,967	6,338,385	1,611,129	5,638,952	2,084,093	7,294,325	2,149,975	7,524,913
Coke.....tons, 2,240 lb.	234,577	1,407,462	245,871	1,475,226	267,725	1,606,350	159,905	959,430
Miscellaneous products.....		2,852,917		1,571,181		1,326,273		1,241,575
Total value of production.....		\$26,388,825		\$29,447,508		\$42,290,462		\$37,010,392

In order that the actual mineral production—that is, quantities, not value—of the three years mentioned in that comment may be readily seen and fairly compared, the following table is presented:

	1912.	1916.	1917.
Placer gold.....oz.	27,775	29,025	24,800
Lode gold.....oz.	257,496	221,932	114,523
Total gold.....	285,271	250,957	139,323
Silver.....oz.	3,132,108	3,301,923	2,929,216
Lead.....lb.	44,871,454	48,727,516	37,307,465
Copper.....lb.	51,456,537	65,379,364	59,007,565
Zinc.....lb.	5,358,280	37,168,980	41,848,513
Coal, gross, tons of 2,240 lb.	3,025,709	2,485,580	2,398,715
Coal, net, tons of 2,240 lb.	2,628,804	2,084,093	2,149,975
Coke, tons of 2,240 lb.	264,333	267,725	159,905
Miscellaneous products.....	\$3,435,722	\$1,326,273	\$1,241,575

These figures make it plain that in the year 1912 quantities of minerals produced were substantially

of the intervening years was 27,775 oz. in 1912, 25,500 oz. in 1913, 28,250 oz. in 1914, 38,500 oz. in 1915, and 29,025 oz. in 1916.

Going back over twenty years and comparing yields of periods of four years each, the following results are shown: For 1898-1901, 211,853.5 oz.; for 1902-1905, 210,908 oz.; for 1906-1909, 145,020 oz.; for 1910-1913, 101,575 oz.; and for 1914-1917, 120,575 oz. It will be seen that while in the first of these four-year periods the average yearly yield was 52,963 oz., that for the last four years was only 30,144 oz. A comparison with years prior to 1880 would show a much larger decrease in recent years than that just indicated.

The grand total of value of placer gold for all years since production was begun in 1858 is on official record as having been \$75,116,103, which calculated at \$20 an ounce would represent 3,755,805 oz. for 60 years, 1858-1917. In that long period the yearly yield ranged from a maximum of \$3,913,563 in 1863 down to a minimum of \$356,131 in 1893. No records are at hand to show the proportions of the several placer gold fields, but it is probable that more than one-half of the total quantity recovered in all years came from Cariboo dis-

trict. In late years, however, Atlin, division of Cassiar district, has been in the lead, as is shown in the following table:

Year.	Cariboo District.		Cassiar District.	
	Cariboo.	Omineca.	Atlin.	Other parts.
1914	10,000	300	16,100	1,150
1915	15,000	600	18,850	1,450
1916	8,900	850	16,925	1,100
1917	7,500	600	15,250	350
	41,400	2,350	67,125	4,050

The yield from all other parts of the Province for the four years totalled only 5,650 oz., against 43,750 oz. from Cariboo district and 71,175 oz. from Cassiar district.

Lode Gold.—The output of lode gold in 1917 was 114,523 oz., compared with 221,932 oz. in 1916, 250,021 oz. in 1915, and 247,170 oz. in 1914. Taking 4-year periods for twenty years, they compare as follows: For 1898-1901, 625,913 oz.; for 1902-1905, 930,024 oz.; for 1906-1909, 914,012 oz.; for 1910-1913, 1,026,068 oz., and for 1914-1917, 833,646 oz. If to these amounts be added 215,086 oz. for the five years 1893-1897, a grand total of 4,544,749 oz. will be obtained, and this is the quantity the official records show to have been produced in all years to the end of 1917.

The 1917 production of individual districts was: Of Boundary-Yale, 60,010 oz.; Rossland, 33,290 oz.; Skeena, 9,805 oz.; Coast (Southern), 3,793 oz.; Lillooet, 3,092 oz.; Nelson, 2,521 oz.; Atlin, 1,000 oz.; Omineca, 931 oz., and all others, 81 oz. Of the Boundary-Yale production, about 37,000 oz. was the output of the Hedley Gold Mining Co.'s mine in Similkameen district, and 1,466 oz. that of other parts, including Nicola, Ashcroft, and Kamloops, probably the last-mentioned in largest part.

Silver.—The output of silver in 1917 was 2,929,216 oz., compared with 3,301,923 oz. in 1916, 3,366,506 oz. in 1915, and 3,602,180 oz. in 1914. For the several 4-year periods of the last twenty years the comparison is: For 1898-1901, 16,341,322 oz.; for 1902-1905, 13,576,019 oz.; for 1906-1909, 10,899,841 oz.; for 1910-1913, 10,940,569 oz., and for 1914-1917, 13,199,825 oz. There was an increase for the last 4-year period as compared with the two periods immediately preceding, but a considerable decrease as compared with that of 1898-1901. The official records show that the production of silver was commenced in a very small way in 1887 and that during 11 years, to 1897 inclusive, the total output was 11,380,964 oz. The grand total of production for all years is 76,338,540 oz.

The 1917 production of individual mining divisions and districts was: Of Sloean and Sloean City divisions, 1,547,576 oz.; Skeena division, 343,805 oz.; Boundary-Yale district, 227,208 oz.; Ainsworth division, 224,461 oz.; Fort Steele division, 180,168 oz.; Coast (Southern) district, 112,652 oz.; Omineca division, 82,311 oz.; Windermere-Golden division, 79,685 oz.; Trail Creek division (Rossland), 47,112 oz.; Nelson division, 46,229 oz., and all others, 38,009 oz. It will be seen that the proportion of Sloean district was nearly 53 per cent. of the whole. The production of East Kootenay district, which includes Fort Steele, Golden, and Windermere divisions, was 259,853 oz., while that of West Kootenay district, embracing Ainsworth, Sloean, Sloean City, Nelson, Trail Creek, Revelstoke, Trout Lake, and

Lardeau divisions, was 1,903,111 oz., or nearly 65 per cent. of the output of the whole province.

The mines making the larger individual productions were the Standard, with an output of about 500,000 oz., and the Surprise and Queen Bess, each about 200,000 oz. These three mines are situated in Sloean mining division.

It is of interest to note that official records show the total production of silver in the year 1897 to have been 5,472,971 oz., in 1898, 4,292,401 oz., and in 1901, 5,151,333 oz.

Official comment for 1917 is to the effect that about 75 per cent. of the total Provincial output of silver comes from the treatment of silver-lead-zinc ores, and the remainder mainly from the smelting of gold-copper ores also containing silver.

Lead.—The output of lead in 1917 was 37,307,465 lb., compared with 48,727,516 lb. in 1916, 46,503,590 lb. in 1915, and 50,625,048 lb. in 1914. For the several 4-year periods since 1897 the figures compare as follows: For 1898-1901, 168,497,522 lb.; for 1902-1905, 133,852,611 lb.; for 1906-1909, 187,738,999 lb.; for 1910-1913, 161,767,274 lb., and for 1914-1917, 183,163,619 lb. The production of the last-mentioned 4-year period was only once exceeded since the mining of lead was commenced in the Province, namely, in that of 1906-1909, as shown above. The total of the output of lead in all years prior to 1898 was 89,166,942 lb., and the grand total for all years from 1887 to 1917, both inclusive, is 924,186,967 lb.

West Kootenay district mines made a total production in 1917 of 21,204,356 lb., or nearly 57 per cent. of the whole of the output of the Province. The proportions of the several mining divisions in this district were: Of Sloean and Sloean City, 11,808,019 lb.; of Ainsworth, 6,395,350 lb.; of Nelson-Arrow Lake, 2,605,666 lb., and of Revelstoke-Trout Lake-Lardeau, 395,321 lb. The production of mines in East Kootenay district totalled 15,771,289 lb., or rather more than 42 per cent. of the Provincial total. Of this quantity, 13,996,640 lb. was from Fort Steele division, and 1,774,649 from Windermere and Golden divisions. From Omineca division there came 271,885 lb., and from various other parts of the Province not already stated, 59,935 lb.

The Sullivan mine made the largest individual output of lead of all mines in the Province, nearly all of the production from Fort Steele division of East Kootenay having come from that mine. The Paradise mine, in Windermere division, produced about 1,200,000 lb. In Sloean division of West Kootenay, the Standard mine made the biggest output, with the Surprise, Galena Farm, and Queen Bess mines next in order as regards quantity produced. In Ainsworth division the Bluebell made an output of about 3,500,000 lb., the Highland about 1,000,000 lb., and the Florence 900,000 lb. In Nelson division, the Emerald was the largest producer, its output having been practically the whole made in the division. In Omineca division, the Silver Standard made by far the largest output of the several shippers from that part of the Province.

Copper.—The output of copper in 1917 was 59,007,565 lb., compared with 65,379,364 lb. in 1916, 56,918,405 lb. in 1915, and 45,009,699 lb. in 1914. The totals for 4-year periods compare as follows: For 1898-1901, 52,595,095 lb.; for 1902-1905, 137,398,357 lb.; for 1906-1909, 176,695,067 lb.; for 1910-1913, 173,088,432 lb., and for 1914-1917, 226,315,033 lb. Official records show that the production of copper was commenced in the

Province in 1894 and that during the years 1894-1897 a total output of 10,421,256 lb. was made. The grand total for all years, 1894-1917, both inclusive, is shown to have been 776,513,240 lb.

District or division proportions of the 1917 output of copper were as follows: Skeena division, 27,978,015 lb.; Coast (Southern) district, 17,256,534 lb.; Boundary-Yale district, 11,117,290 lb.; Trail Creek (Rossland) division, 1,730,088 lb.; Omineca division, 852,373 lb., and all others, 73,265 lb.

More than one-half of the total production of copper in the Province in 1917 was from the Granby Consolidated Co.'s mines, its Hidden Creek mines, near Anyox, Observatory inlet, having made an output of 27,661,301 lb., and those at Phoenix, Boundary district, of 6,858,718 lb., together, 34,520,019 lb. Other copper producers in Boundary district were the Canada Copper Corporation, from its mines near Greenwood, and the Consolidated Mining and Smelting Co., from the Emma mine. In the Coast (Southern) district, the Britannia is credited with an output of 15,780,830 lb., with the Marble Bay mine, on Texada island, next, but with only a comparatively small output. Rossland mines show a considerable falling off, with an output of only 1,730,088 lb., compared with 4,200,745 lb. in 1916, 4,651,681 lb. in 1915, and 3,779,830 lb. in 1914.

It is noted, officially, that "During the last three years copper-mining has attained the position of being the most important form of mining in the Province of British Columbia, and from all indications it should maintain this prominent place for years to come, as last year the value of the copper mined exceeded the total value of all other metalliferous minerals mined in the Province, and was also nearly double the combined value of coal and coke production. It formed about 60 per cent. of the total mineral production. In the working of the large, low-grade copper deposits and the subsequent smelting of the ores produced, a great number of men are employed and a large proportion of the money value is retained in the country in the payment of wages and purchase of supplies."

Zinc.—The output of zinc in 1917 was 41,848,513 lb., compared with 37,168,980 lb. in 1916, 12,982,440 lb. in 1915, and 7,866,467 lb. in 1914. Although there was some zinc produced prior to 1909, no record of the quantity appears in the tables printed in the Annual Report, but for that year an output of 8,500,000 lb. is recorded. For the 4-year period 1910-1913 the total was 18,935,784 lb., and for that of 1914-1917, 99,866,400 lb. The grand total of production for all years, 1909-1917, is shown as 127,302,184 lb.

The 1917 production from East Kootenay district was 20,733,090 lb., of which 20,715,090 lb. was from Fort Steele division, and the remaining 18,000 lb. from Golden division. West Kootenay mines produced 20,723,762 lb., the proportions of several of the divisions having been: Slocan, 18,789,573 lb.; Nelson, 982,309 lb.; Ainsworth, 918,601 lb., and other divisions of the district, 33,279 lb. The Highland Valley Co.'s mine, in Ashcroft mining division, probably produced the remaining 27,564 lb., making up the comparatively small quantity from other parts of the Province.

In the Annual Report it is stated that in the Slocan district the heaviest shipper in 1917 was the Standard mine, with an output of about 10,700,000 lb. of zinc, followed by the Lucky Jim and the Surprise, each with about 2,000,000 lb.; then the Galena Farm, Van-Roi, and Slocan Star. The Fort Steele production came entirely from the Sullivan mine, the ore from which

was shipped to the electrolytic refinery at Trail. The Nelson division production was a zinc-carbonate ore shipped from the Hudson Bay group of mines near Salmo, to United States smelteries for treatment. The Ainsworth division production was mainly from the Bell and Whitewater mines, each with an output of about 400,000 lb. That from Omineca division was hand-sorted ore from the Silver Standard mine, shipped to the United States.

Other Minerals.—The information given in the Annual Report under this subhead does not record much production. It is stated that "the production of miscellaneous minerals produced in British Columbia in 1917 was valued at \$37,029. "It is gathered that about \$1,700 worth of crude platinum recovered in the Similkameen district" (which includes Tulameen) "was included in the placer output," presumably the placer-gold output. Excerpts from the commend under this subhead follow:

"It has been strongly advocated in many quarters that the conditions are favorable for the establishment of an iron-smelting plant somewhere on the British Columbia Coast. So far nothing definite has materialized, although there is apparently a prospect of such a plant being established. As is well known there is, on the Coast, in the aggregate, an adequate supply of magnetite-iron ore, quite sufficiently free from impurities as to be within the 'Bessemer limit,' to supply ore for such a plant."

"A small quantity of crude platinum is recovered each year from placer-mining operations in Similkameen district. . . . The occurrence of small quantities of platinum in-place in the periodotite rocks of the Upper Tulameen river has been known of for years; and . . . prospecting has been resumed to see if any zones in this formation can be found which would pay to work for the platinum content."

"The actual Provincial output of molybdenite during the year was 152 tons of ore, containing about 12,000 lb. of molybdenite. Nearly all the production was from the Molly group, on Lost creek, in Nelson mining division. . . . The Lost Creek property has several thousand tons of from 2 to 4 per cent. ore, so that, with a suitable mill, a steady production could be maintained. . . . Another property, on Alice arm, in Skeena mining division, is reported to have a large showing of molybdenite. A mill was erected on the property in 1916 and about 383 tons of 2 per cent. ore was treated. Other prospects in Nelson, Kamloops, and Lillooet mining division have been investigated, but as yet none of them have assumed any great importance."

"Near Kaslo (West Kootenay) a manganese deposit has been developed during the past year and there is said to be a considerable tonnage ready for shipment."

"So far as is known, no tungsten ore has been produced in shipping quantities from the Province, but tungsten minerals, generally in association with other minerals, have been noted in a few localities. A deposit of scheelite (calcium tungstate) has been known of for many years, situated near Barkerville, Cariboo district."

"Antimony . . . is a common mineral in British Columbia, occurring in association with lead and zinc ores. It does not, however, as a rule, occur in large quantities, but attempts are now being made in a few places to sort it out from its associated minerals. In 1916, 27 tons of antimony ore were shipped from the Alps-Alturas property, situated in Slocan mining divi-

sion; this ore contained from 50 to 60 per cent. antimony."

"Small deposits of chromite occur in Tulameen district, but so far have been considered too small to be developed. A deposit near Cascade, Grand Forks mining division, is now being developed and other occurrences are being prospected."

"In 1917, 105 tons of talc was shipped from Lillooet district and an increasing production may be expected. Several hundred tons of epsomite (magnesium sulphate) was shipped from Osoyoos division."

"For the first time in the history of the Province there was a production of arsenic; this was made from the Hedley Gold Mining Co.'s Nickel Plate mine and amounted to \$20,000. The arsenic occurs as arsenical iron pyrites in the concentrates shipped by this company to the Tacoma smeltery. Concentrates have been going to the smeltery for years, but until the recent installation of an arsenic-burner the arsenic content was not recovered."

The total value of "miscellaneous minerals, etc.," for all years up to and including 1917, is shown in the Annual Report to have been \$554,448. This includes a lot of iron ore which, years ago, was shipped to smelting works from Cherry creek, Kamloops mining division, for use as a flux.

Coal and Coke.—The gross production of coal in 1917 was 2,398,715 tons of 2,240 lb., compared with 2,485,580 tons in 1916, 1,972,580 tons in 1915, and 2,166,428 tons in 1914. The quantities made into coke in the several years were: In 1917, 248,740 tons; in 1916, 401,487 tons; in 1915, 361,451 tons, and in 1914, 355,461 tons. Net quantities of coal were: In 1917, 2,149,975 long tons; in 1916, 2,084,093 tons; in 1915, 1,611,129 tons, and in 1914, 1,810,967 tons. Following the official custom in the Province, credit is taken for the coal "lost in washing, etc.," as well as that "used under companies' boilers, etc." In 1917, that "lost in washing" amounted to 226,430 tons, and that used under colliery boilers, etc., to 198,102 tons.

The totals of net coal (that is, after deduction of that made into coke) for 4-year periods are as follows: For 1898-1901, 5,342,115 long tons; for 1902-1905, 5,203,528 tons; for 1906-1909, 7,001,695 tons; for 1910-1913, 9,759,395 tons, and for 1914-1917, 7,656,164 tons. Official records show that coal-mining was commenced in 1836 and that production of coal for all years prior to 1898 totalled 12,081,687 tons, which, added to the total for 20 years, 1898-1917, makes a grand total of 47,044,584 tons net produced.

The following table, copied from the Annual Report, show the proportions of production of coal and coke by the several districts in the Province during the last four years, in tons of 2,240 lb.:

Mines of	1914	1915	1916	1917
Coal—				
Vancouver Island	1,072,314	1,020,942	1,492,761	1,695,721
Nicola & Similkameen ..	138,931	99,066	110,549	151,243
Crowsnest	955,183	852,572	882,270	551,751
Total quantity of coal mined	2,166,428	1,972,580	2,485,580	2,398,715
Less made into coke..	355,461	361,451	401,487	248,740
Net quantity of coal produced	1,810,967	1,611,129	2,084,093	2,149,975
Coke—				
Vancouver Island	5,450	27,604	30,406
Crowsnest	234,577	210,421	240,121	129,499
Total quantity of coke produced	234,577	245,871	267,725	159,905

The totals of coke production for 4-year periods are as follows: For 1898-1901, 281,481 long tons; for 1902-

1905, 803,771 tons; for 1906-1909, 928,242 tons; for 1910-1913, 834,412 tons, and for 1914-1917, 908,078 tons. Coke-making was commenced in the Province in 1895; in three years, 1895-1897, there was made 19,396 tons. The grand total for all years is 3,775,380 tons.

A general idea of where the coal and coke produced in British Columbia is consumed can be gained from the following statement relative to 1917: Coal sold for consumption in Canada, 935,469 long tons; for export to the United States, 754,568 tons; for export to other countries, 38,211 tons; total, 1,728,248 tons. Coke sold for consumption in Canada, 147,811 long tons; for export to the United States, 12,711 tons; total, 160,522 tons. The small difference between the totals of production and sales of coke is accounted for by what was taken from stock.

Building Materials.—The total value placed on the structural materials produced in 1917 is \$1,204,546, in the following proportions: Portland cement, \$587,829; lime and limestone, \$102,223; building stone, \$113,275; riprap, \$28,170; crushed rock and flux, \$138,830; sand and gravel, \$61,642; pottery and clay, \$81,728; fire, face, and red brick, \$190,849; total, \$1,204,546. Figures are not at hand for a comparison of 1917 production with that of preceding years, except as appearing in the general table of production for four years, 1914-1917. The total value of building materials, etc., for all years is given in the Annual Report as \$27,902,381.

Official comment on the 1917 production includes the following: The production of building materials in 1917 was slightly less than in the preceding year, having been \$1,204,546, as compared with \$1,299,553. Since 1912, when a production amounting to \$3,435,722 was recorded, the output of building materials has steadily declined, due to the cessation of the building trade, brought about by the continued financial depression and the war. It is probable that the figures have now reached a minimum, and that an output amounting to from \$1,000,000 to \$1,500,000 represents the steady yearly demand for these materials for use in repairs, renewals, and various small demands, without any new construction work. . . . The outputs of sand and gravel, of brick and pottery, are all slightly less than in 1916, but the decrease is not serious. The outputs of fire and face brick and cement show an increase. . . . Approximately 88 per cent. of the total production of building materials comes from the Coast district, and the larger part of this finds its markets in the Coast cities.

The production of portland cement in the Province is made by two companies, namely, the Vancouver Portland Cement Company, with works at Tod inlet, and the Associated Cement Company, with works at Bamberton, both in Victoria division in the southern part of Vancouver island. The combined production for 1917, valued at \$487,829, compares with \$436,459 in 1916.

It is stated that nearly \$100,000 worth of limestone (included in the item "crushed rock and flux") was quarried for use as flux in the respective smelting works of the Granby Consolidated Co. at Anyox, and the Consolidated Mining and Smelting Co. at Trail.

Total Value of Production.—The Annual Report shows the total value of the mineral production of the Province for all years, 1852 to 1917, inclusive, to have been \$595,571,107. For all years to 1897, inclusive, the total was \$112,510,465; that for later 4-year periods was as follows: For 1898-1901, \$59,731,523;

for 1902-1905, \$76,421,188; for 1906-1909, \$99,157,408; for 1910-1913, \$112,613,336, and for 1914-1917, \$135,137,187.

The proportions of value of the different minerals were: Of placer gold, \$75,116,103; of lode gold, \$93,717,974; of silver, \$43,623,761; of lead, \$39,366,144; of copper, \$130,597,620; of zinc, \$10,379,018; of coal and coke, \$174,313,658; of building stone, bricks, etc., \$27,902,381, and of miscellaneous minerals, \$554,448.

The Columbia Mines Company's Operations on Pine Creek.

The Gold Commissioner for Atlin, B.C., in his report for 1917 respecting operations on Pine Creek of that District, says: "On Pine Creek the Columbian Mines Company, representing the North Columbia Gold Mining Company, the Pine Creek Power Company, and the Atlin Consolidated Mining Company, under the general management of Paul W. Greyer, with a force of between 40 and 45 men, operated at two points on the south side of the creek, besides carrying on drifting operations on the Atlin Consolidated Mining Company's ground on the north side."

These operations since have ceased. Certain judgments were secured against the company, and a considerable part of its holdings were offered for sale by the sheriff for the satisfaction of judgment creditors. It is alleged that fifty-two gold placer claims, a number of mineral claims, a lake dam, ditches and water system, blacksmith's shop, machine shop and equipment, engines, boilers, machinery, a telephone system, electrician's shop and supplies and "one certain Ford automobile" changed hands for sheriff's charges, a matter of \$62 odd. The holdings, plant, etc., have a value running well into the thousands of dollars, and their sale at such a ridiculously low a figure caused considerable comment in Atlin. It is pointed out, on the other hand, that the purchaser and his associates have unsatisfied claims against the company of a substantial character. It appears that there are a number of miners in the District to whom the company owes back pay for labor performed, and the new owners, no doubt recognizing their right to consideration, granted several of them a lay on the ground thus acquired, the terms being that they should pay all expenses of operation in return for 75 per cent. of the gold recovered. Not all of those to whom wages were due and unpaid, however, obtained this privilege, according to reliable report. Consequently, there was no little dissatisfaction. However, those who were granted the lay, went to work and in a short time made a rather tidy clean-up, the gold being shipped to the Coast. In the meantime, Messrs. Tallmire and Wesche, the former of whom is reported to also have a claim against the company, staked claims which were being worked by the lay-men. Mr. Tallmire, in taking the oath necessary in the process of recording under the British Columbia Placer Act that "the said land is at present **unoccupied** for placer-mining purposes," made affidavit that his understanding of the word "unoccupied" was that it was "unoccupied" in a legal sense. Following this, Messrs. Tallmire and his partner were charged with perjury, committed for trial, and their hearing is to take place at an early date. Meanwhile, the historic gold mining camp of Atlin is astir over the affair, and its development is being closely watched throughout the Province. The unfortunate position of the company, which has been forced to close down and whose property and plant has thus been dis-

posed of, is a commentary on the conditions which gold producing concerns find confronting them because of the fixed value of their product while that of other minerals soars and labor and other expenses increase.

PERSONAL

Mr. D. B. Dowling, president of the Canadian Mining Institute, expects to return to Ottawa from the West about October 12th.

Mr. Reginald E. Hore has returned to Toronto from Nova Scotia.

Mr. F. W. Gray, who recently joined the staff of the Nova Scotia Steel & Coal Co., Ltd., is now at New Glasgow.

Mr. Thos. J. Brown has been reappointed general superintendent of Nova Scotia Steel & Coal Co., Ltd.

Mr. Gerald Murphy, of the Technical College, Halifax, has been granted leave of absence and is now on the staff of the Nova Scotia Steel & Coal Co., Ltd.

Fraser & Chalmers of Canada, Ltd., of Montreal, Que., have been awarded a contract by the Corporation of the town of Pointe Claire, Point Claire, Que., for a 1,500-gallon centrifugal pump direct connected to a Sterling gasoline engine.

Mr. P. Kirkgaarde is building an electric smelting plant at Cordova Mines for the production of ferrochrome.

Mr. H. Vassiliadi, of London, Eng., was in Toronto recently en route to Kirkland Lake.

Mr. E. Jacobs is in Phoenix, Arizona.

VISITING HERB LAKE GOLD FIELD.

The Pas, Man., September 13.—Commissioner J. A. Campbell returned on Sunday last from his trip to Port Nelson and Churchill, accompanied by his brother, C. N. Campbell, superintendent of the Granby Mine at Phoenix, B.C. They took the Ross Navigation Co. boat on Tuesday evening for Sturgeon Landing, and then on to the mining regions at Athapapuskow and Schist Lakes. After giving that district a look-over they will return to The Pas and take gasoline car to Mile 82 on the H.B.R. line, where they will trail in to Herb Lake gold fields on a visit.—The Pas Herald.

PICTOU STRIKE SETTLED.

New Glasgow, N.S., Sept. 27.—The miners' strike at the Pictou county collieries is settled. The operatives go to work next Monday, accepting an advance of 20 cents per day in wages. The acceptance was based on the balloting to-day, which resulted in an overwhelming majority of "yeas" at the three mines—Drummond, Acadia and Thorburn. The committee to investigate the high cost of living as it affects the miners will be appointed to-morrow, the chairman to be chosen by the Trades and Labor Council. The other two members, one to represent the men and the other the companies, will be elected.

The Mining Department of the Sudbury High School offers a practical technical education in the subjects related to the mining industry. The course includes mathematics, surveying, drafting, chemistry, physics, mineralogy, geology, mining, metallurgy and extends over a period of four years. While this course admits to any department of the Faculty of Applied Science of Queen's University, it is intended chiefly for the boy who will not go to college.

SPECIAL CORRESPONDENCE

**NORTHERN ONTARIO.
New Manager for Beaver.**

Mr. J. W. Moffet, who for many years has managed operations at the Beaver mines here, has tendered his resignation to the company, owing to ill-health. The management of this property is more than ordinarily strenuous owing to the fact that the Beaver company, as well as operating the parent property at Cobalt, controls and operates the Kirkland Lake Gold Mines, Limited, at Kirkland Lake. At the latter property a mill is nearing completion while underground upwards of \$800,000 in gold is blocked out. At the Beaver property in Cobalt, results of development work during the past few months have proven highly gratifying to the management, and it is anticipated the company has a number of years' successful operations still ahead of it. Mr. L. W. Ledyard, who has had a fitting experience in mining in the north country, has been appointed to the position of manager of the Beaver and the Kirkland Lake mines. Mr. Ledyard was for a considerable time connected with the Buffalo Mining Company at Cobalt and later with the Teck-Hughes at Kirkland Lake, where, until early in the present year, he occupied the position of manager, thus gaining an intimate knowledge of both districts in which the Beaver company are at present operating properties.

Kerr Lake.

During the month of August the Kerr Lake Mining Company produced upwards of a quarter of a million ounces of silver, which compares with 231,000 ounces during July. With the exception of the month of July the August output was the highest in the history of the company. The fiscal year of the Kerr Lake ended on August 31st. During this period upwards of 2,575,000 ounces of silver was produced. Owing to the high price prevailing for the white metal during the past year it is quite apparent the company's earnings have exceeded all previous records.

Nipissing.

Production at the Nipissing Mines for the month of August was considerably retarded owing to the fact that the aerial transmission line conveying ore from the Meyer and Fourth of July shafts to the mill on the east side of Cobalt Lake being out of commission for about ten days. This accident necessitated the treating of ore from other portions of the property, which was of a lower grade, and considerable inconvenience was otherwise experienced. The trouble was speedily overcome and the mine is operating at full capacity.

Development Work at Dome Mines.

A force of about sixty men are engaged in development work at the 1,250-ft. level of the Dome Mines, where an important development crosscut is being driven to the east and a great underground roadway built for the haulage of ore which has been indicated in the diamond drilling programme carried out by the company some time ago. If ore is found to continue in the same volume to the depths now indicated on the property at the first few levels, a great and prosperous future is in store for the Dome Mines. In the neighborhood of ten millions of dollars in gold has been developed in the Dome Mines above the seven-hundred-foot level, and the present point of operation is almost double the depth of these workings. The closing down of the large mill at the property, owing to the scarcity of labor, was a discouraging event to the shareholders, but in view of the present economic conditions, this step will ultimately work out to the benefit of the

shareholders. At the beginning of the current year the books of the company showed a cash surplus of about half a million dollars. This ready capital places the company in an excellent position for the carrying on of development work and the proving up of the ore bodies at greater depths. At the same time, the general scheme of development of the property is being carried out and with a return to satisfactory working conditions, it will be possible to operate at maximum capacity with a minimum of cost. When this time arrives, it is the opinion of well-informed mining men, Dome Mines will once again take its place among the leading gold producers of the Dominion.

Lake Shore Mine.

The official report of the manager of the Lake Shore Mines to the president and directors of the company, covering the operations at the property during the month of August, shows an increase in production of approximately \$5,000 over the month of July, and establishes a new high record of production for the company. According to the report, the mill ran 95.18 per cent. of the possible running time, the value of the output being estimated at \$44,000. Underground work consisted of crosscutting on the No. 1 vein at the 200-ft. level; also advancing the drift on the No. 2 vein. The raise on the No. 1 vein at the 300-ft. level was connected up with the No. 2 level, while the No. 2 vein was further opened up during the month. The ore hoisted for the period totalled 1,732 tons. Since the commencement of milling operations on March 8th last a steady increase in output has been recorded with the exception of the month of July, when delays were experienced which resulted in the mill running only 85 per cent. of the possible running time. During the first six months of operation 9,393 tons of ore have been treated, from which a recovery of \$236,049 has been made. The consistency of the milling operations and uniformity of ore value is evident by a perusal of the monthly tonnage and production of the company since the commencement of operations, which is as follows:

Month.	Tons.	Value.
March (8th to 31st)	1,050	\$23,606.56
April	1,520	42,090.00
May	1,750	43,000.00
June	1,761	43,353.36
July	1,580	39,000.00
August	1,732	44,000.00
Totals	9,393	\$236,049.00

During the month of August the mill heads averaged \$25.40 per ton. It is estimated the cost of production runs around \$8 to \$10 per ton, thus it will be seen a substantial profit is being made above the requirements of the company to disburse a regular quarterly dividend of 2½ per cent. At the same time, as a large amount of the ore being treated in the mill is coming from development work, the ore reserves of the mine are being added to at a rapid rate.

The Wright-Hargreaves Mill.

Mr. James Grant, who for a considerable time has been connected with the McIntyre-Porcupine mines, has been engaged to design and ultimately construct a mill for the Wright-Hargreaves property at Kirkland Lake. The new mill, which will be of 150 tons capacity, will be of the most modern type, similar to those in operation at the McIntyre and Lake Shore mines, and which have given excellent results at both these properties. The grinding will be done in ball and tube mills with the continuous counter-current decantation process of treatment.

The auriferous zone of the Kirkland Lake district passes directly through the Wright-Hargreaves, which embraces a stretch of nearly three-quarters of a mile of this important orebody. High-grade ore has been proven to a depth of 400 ft. on the property while on that of the Kirkland Lake Gold property at a depth of 700 ft. the grade and width of the orebody has been found to persist, with every indication of continuing to much deeper levels. From the foregoing it would appear the Wright-Hargreaves will eventually develop into a large mine.

Tough-Oakes.

About twenty-five men are now on the pay-roll of the Tough-Oakes Mines at Kirkland Lake, engaged in pumping, and cleaning up around the mill. It is expected this work will be completed about the first week of the coming month and if arrangements for the transfer of the money liberated by recent court proceedings in England is then available a large programme of underground development will be undertaken and the mine again placed in good shape. It is understood that after legal expenses are paid the Tough-Oakes treasury will be swelled to the extent of one hundred and fifty thousand dollars by the court's decision.

Ontario-Kirkland.

Camp and other buildings on the Ontario-Kirkland Mining Company's property have been completed. Electrical machinery throughout will be installed for the operation of the mine and already a four-drill compressor and electrical hoisting apparatus have been placed on order. Two veins have been uncovered on the property of good promise. One is said to be about two feet in width, containing average values of forty dollars; while a second vein, about four feet in width, gives average assays of twenty-five dollars per ton.

Teck-Hughes.

Efforts are being made by the management of the Teck-Hughes mine to re-open the property and it is hoped that an efficient organization will be secured to recommence operations the early part of next month. Owing to the fact that material for the refinery has also been placed on order it is expected both mining and milling will be proceeded with. Underground operations at this property have been carried to a depth of six hundred feet.

Kirkland-Porphyry.

Mr. Joseph Houston, formerly assistant manager of the Dome Mines, has accepted the position of manager at the Kirkland-Porphyry property. Development work at this property has reached a depth of 400 feet, with lateral work at each 100-foot level. Results of development to date have been highly encouraging. Where the vein was encountered at the 400-ft. level, gold values were shown over a width of twenty feet in places. The principals of the company are predicting that the mine will be on a producing basis before the conclusion of 1919.

Lightning River.

Mr. J. Morrison, formerly connected with the Lake Shore Mines at Kirkland Lake, has taken charge of operations at the Howie-Cochener Williams discovery claims in the Lightning River district. The plant recently installed is now in operation and the shaft has reached a depth of fifty feet. With the steam power available, it is expected more rapid progress will be made with the work from this time forward.

To Develop Water Power in Gauthier Township.

According to reports received at Cobalt, Montreal interests have organized a syndicate for the development

of a water power on the Beaver House River in Gauthier township. It is estimated about one thousand horsepower will be made available. The De La Huronia mine is located in this township and is owned by Montreal interests, which leads to the belief that the two propositions may have some connection.

Mr. Globe Goes to Sellwood.

Mr. A. R. Globe, formerly assistant general manager of the Hollinger Consolidated Mining Company at Porcupine, has taken charge of operations on an iron property near Sellwood in the Sudbury district. The town council of the town of Timmins presented Mr. Globe with a handsome club bag and address on his departure from the town.

A Mill for Burnside Property.

A new mill is to be erected at the Burnside property which is operated by the Aladdin-Cobalt Company at Kirkland Lake and will have a capacity of about thirty tons per day. The process will be straight amalgamation. The development of this property is being carried on with all possible speed. One shaft has reached a depth of 360 ft. and will be carried to the 425-ft. level. At this depth it is the intention of the management to run a crosscut to the south to the number six vein which is a distance of about 750 ft. A new shaft is now being commenced on this vein. When these two workings are connected, operations at the property will be greatly facilitated and better ventilation provided. It will then be possible to draw ore from the number six vein through the main shaft to the mill. Three other veins located a short distance south of the number six will be crosscut at a later date.

Activity in Boston Creek Area.

A number of important gold discoveries have been reported at widely separated points in the Boston Creek district during the past two weeks, and much general activity is apparent in the district, with many deals for properties being put through. During the week the O'Donald group of claims were optioned to Robert W. Norrington and associates, of Detroit. This group of claims comprises 200 acres, being claims Nos. 17951, 17953, 17954, in the township of Pacaud, and two claims, Nos. 5023 and 5024 in the township of Boston. The group lie directly between the R.A.P. Syndicate and Boston Creek Gold Mines on the west and the Patricia Mines on the east. The purchase price is said to run well up in six figures. A minimum of \$1,000 per month is to be spent in development work on the property and is to be commenced at once. Situated as these claims are, in the heart of the new gold camp, their development promises to be full of interest. The O'Donald group have long been known as the pioneer claims of the Boston field, having been purchased by J. C. O'Donald in 1913, since which time much development work has been done and a number of promising discoveries made.

During the past week a discovery of gold of considerable importance was made on the Campbell claims, situated in the northwest corner of the township of Catharine and including ground in the southwest corner of the township of McElroy.

Later in the week, word was received of still another discovery being made, this time on the Rogers-Barnett group of claims in Catharine township. A number of samples containing free gold were brought out recently and the discovery promises to be of more than ordinary importance. The dike in which the discovery was made is about forty feet in width and appears to be composed of altered basalt and diorite in which quartz veins carrying gold in coarse particles occur. This latest discovery

does not resemble in any way the ore being developed at the Miller-Independence property which lies about eight miles to the northwest, the occurrence of the gold as well as the rock formations of the district being greatly different, porphyry being absent at the point of the new discovery. The new find is on one of a group of six claims in lot 5, concession 2, Catherine. This latest discovery has caused a number of prospectors to flock to the district, with the result that practically all the surrounding territory has been staked. The area of the Boston Creek field is greatly enlarged and increased activity will likely prevail in the prospecting line from this time forward until the snow flies.

At the Miller-Independence property the shaft has reached the 200-ft. level and crosscutting is under way on the vein. The mill is being put in order for operation and when completed at least four faces on the new vein will be available from which to draw ore for milling. The results of the initial run on the ore from the new vein will be awaited with a good deal of interest.

The new railway station at Boston Creek has been completed and the camp has telegraphic and station service, the agent having been moved from Dane. Developments during the past summer have been of sufficient importance to make the change very necessary and much inconvenience is thus eliminated. Both passenger and freight traffic to and from the camp during the past summer has shown a very marked increase.

Will Operate Parragon-Hitchcock Property.

Arrangements have been completed for the commencement of operations on the Parragon-Hitchcock silver property at Wabun station on the T. & N. O. Elk Lake branch. These two properties figured in a consolidation several months ago.

May Develop Timagami Iron Deposit.

It is understood there is a possibility of a syndicate being formed for the operation of the Caldwell and Mulloch iron property, about one and a quarter miles north of Timagami station on the T. & N. O.

Skead Township.

Efforts are to be made this fall to secure assistance from the government in the building of a winter road from the Boston Creek camp west to the Skead township mining district. Plans are under consideration for co-operation between property owners in the district and the government in the construction of the proposed new roadway.

Matachewan.

The option held on the Ryan group of claims in the Fort Matachewan district by Robert Norrington and associates of Detroit, has been allowed to expire and the claims have reverted to their former owners. The equipment from these claims has been moved to the Boston Creek camp, where it will be used in the exploration of a number of claims under option to Detroit interests, among which are the Renaud-Cullen group.

Will Reorganize Bailey Company.

Word comes to hand this week that the Shareholders' Protective Committee of the Bailey Cobalt Mining Company have secured judgment against the directors of the company, and negotiations are now in progress for a restoration of the business of the corporation on a new basis. It is expected the company will be properly organized within the next sixty days and an accounting will then be taken of the outstanding shares. The judgment of the court is that the property belongs to the shareholders and that the total liabilities of the company will be \$15,000 inclusive of the legal expenses. The property has been idle for the past two or three years.

JAMES DOUGLAS.*

By Rossiter W. Raymond.

James Douglas was born at Quebec, Canada, November 4, 1837. His father, James Douglas, was a distinguished physician and surgeon, known in many lands, especially in the Orient, and famous in his own country for his philanthropy as well as his skill, having established and directed for many years the first retreat for the insane in the Dominion of Canada.

One of the latest literary labors of his son was the editing and publishing of his father's journal and reminiscences—a fascinating volume, the review of which, though a tempting task, I must here forgo. Nearly fifty years ago, I had the great pleasure of spending an hour with the elder Douglas, who guided me through his collection of Egyptian and Asiatic treasures. I might almost say souvenirs; so many of them were connected with personal experiences and exalted personages. The veteran's memory had already begun to fail with age, but his vivacity and imagination glowed all the more brightly; and his reminiscences of travel and adventure were embroidered with Oriental magnificence. I felt, after that hour, as if I had visited a stately, half-ruined edifice, overgrown with vines and flowers.

The father's genius, adventurous spirit and generous philanthropy descended to his versatile, yet practical son. Like other men of such temperament, James Douglas tried many things before circumstances beyond his own control forced him into the line of his principal lifework. At the age of 18, he was sent to the University of Edinburgh, where he studied for two years. Returning to Canada, he entered Queen's University, at Kingston, Ontario, where he was graduated as Bachelor of Arts in 1858. Subsequently he studied medicine at Laval University, Quebec, and it was doubtless during this period that he assisted his father in the management of the Quebec lunatic asylum; and also traveled extensively with him in Europe and the East. In connection with his study of medicine at Laval University he became interested in chemistry, which he afterward taught for several years at Morrin College, Quebec. No doubt his excursion in this direction was initiated by his acquaintance with a man who was destined to have a decisive influence upon his future career, namely, Thomas Sterry Hunt, at that time about 33 years old, who was lecturing on chemistry in the French language at Laval. Hunt's prodigious intellectual activity, keen insight into the facts and laws of nature, and fierce enthusiasm in the pursuit of scientific truth (qualities evident enough in later years, but doubtless supereminent in his youthful prime) must have affected profoundly a mind like that of Douglas. The two became close friends and in after years business partners. Yet meanwhile their paths were widely sundered. Hunt continued his brilliant career as chemist and geologist, on the Canada Geological Survey, in the faculty of McGill University, on the juries of successive international expositions, as the recipient of sundry honorary degrees and decorations, as prolific author of notable scientific papers, and finally as Professor of Geology in the Massachusetts Institute of Technology, and one of the most active promoters and officers of the American Institute of Mining Engineers. Douglas, meanwhile, returned to Edinburgh, to continue the study of medicine—choosing, however, this time the more scientific branch of surgery—and pursuing as an avocation at the same time a course on theology, which he carried so far as to receive a license to preach. It is permissible to con-

*From the September bulletin of the American Institute of Mining Engineers.

jecture that he prophetically foresaw the type of spiritual leader who ministers to both soul and body—a type more fully developed nowadays in the medical missionary, and furnishing for Douglas a welcome compromise, or rather combination, of activities, satisfying at once his love of science and his love of men. But his professional plans were cut short by the pecuniary embarrassments of his father, who had made unfortunate investments in mining schemes; to assist him, the younger Douglas returned to Canada, about 1871.

The investments referred to were in the Harvey Hill copper mines in Quebec, the 2 per cent. copper ores of which could not be economically treated at that time by any known process. Douglas was doubtless familiar with the researches of Sterry Hunt on the reactions between cupric oxide, sulphur dioxide, etc., and had recourse to his old friend in this emergency. Together they worked out the famous Hunt and Douglas process, the original form of which was described by Hunt as follows:

"The essential principle of this new process . . . is the dissolving of the oxides of copper by a hot solution of protochloride of iron and common salt. In the action which takes place, the protochloride of iron is converted into peroxide, while the oxides of copper are changed to protochloride and dichloride, the latter of which, though insoluble in water, is readily soluble in a hot, strong brine. From the solution thus obtained, metallic iron throws down the copper in a metallic state, regenerating the protochloride of iron, which is then ready for the treatment of a fresh portion of oxidized copper ore."

The obvious ingenuity and beauty of this process made it very attractive to metallurgists; and for a time it was believed that the treatment of 2 per cent. copper ores had been made economically practicable in this way. It would be easy but tedious to enumerate here the many practical and commercial difficulties which have proved, so far, insurmountable by such methods. In 1893, Douglas himself wrote:

"There has been, however, but little patronage extended to wet copper-methods, mainly because we do not possess, within accessible reach of the chemical centres, any large bodies of cupriferous pyrites, whose residues, after the extraction of sulphur and copper, would possess value as an iron-ore. The treatment of the low-grade oxidized ores of the Southwest is awaiting realization. In the past, various attempts have been made to employ old and new wet methods; but none has proved commercially successful, nor has any survived until to-day."

In 1875, Mr. Douglas went to the United States as Superintendent of the Chemical Copper Co., of Phoenixville, Pa., which treated copper ores and pyritic cinders, and also melted and refined base metal. A variety of the Hunt and Douglas process was employed for extraction. It was a small plant, and ill-supplied with capital. I remember examining it while Douglas was in charge, and admiring the courage with which he struggled against technical difficulties, and the ingenuity with which he devised substitutes for expensive apparatus. It was an up-hill business, and after some years of strenuous endeavor the plant was destroyed by fire. But the discipline of the long contest had made a strong man of Douglas, while his business relations had brought him into contact with many who could not fail to be impressed by his ability and integrity. For some years after the failure of the Phoenixville enterprise, he was without fixed employment, though he did some important consulting work, visiting

Montana, Colorado and other mining districts. Concerning the stroke of well earned "good luck" which placed him on the straight road to fame and fortune, I cannot do better than quote the story as told by Dr. Ledoux:

"An accident brought him into contact with the old metal house of Phelps, Dodge & Co. When the Copper Queen mine was opened by Martin and Reilly, the first carloads of copper bars were sent to Phoenixville to be refined by Dr. Douglas's works. He had been introduced to Mr. William E. Dodge and had been retained to report on the Detroit Copper Company's mines in Arizona. This firm was conservative in the extreme and, while very large sellers of metals, had but recently entered into the mining field, considering mining somewhat of a gambling venture. Urged by an acquaintance, they had taken an option on the former Copper Queen—the original of the name—in Arizona, and engaged Dr. Douglas to examine it. They agreed to pay his expenses and to furnish him with a certain sum of money with which to test the property, promising that if they took it over on his recommendation, they would place the management in his hands and give him an interest.

"The world knows to what great heights Phelps, Dodge & Co. have attained in the mining business. Dr. Douglas, upon the incorporation of the firm, became its President. The writer feels sure that those who have succeeded to the control of this corporation after the deaths of Messrs. William E. Dodge, Senior and Junior, and of Mr. D. Willis James, will not resent the statement that, in the writer's opinion, Dr. Douglas supplied the imagination necessary in all great enterprises, while they supplied the money and equally important careful business management.

"The product of the smelter at Bisbee was hauled several miles to the railroad by mules. He put in the first traction engines employed in the southwest. This method becoming too slow, he built the railroad from Bisbee to Fairbanks, the junction with the Southern Pacific. When the product of the Copper Queen became too great to handle economically at Bisbee, it was his idea to establish at Douglas the beginning of the great smelting plant which to-day is second to none—if not in capacity, at least in well thought-out installation and correlation of its parts; in efficiency and economy in management.

"Looking further ahead than the life of the Copper Queen, it was Dr. Douglas who suggested the taking over of adjoining properties in the Bisbee camp, and the agreement to disregard the law of the apex and questions of extra-lateral right, so there has been no litigation at Bisbee from these fertile sources of trouble in most mining camps.

"It was Dr. Douglas, again, when fuel became expensive and irregular in delivery, who suggested the organizing of a coal company to supply their own needs and to enable them to sell coal and coke to others without paying tribute in high freights to the railroad. Again, it was his suggestion that their railroad should be extended to El Paso, and that branch lines should be built into Mexico, where, on his initiative, Phelps, Dodge & Co. had already secured important producing mines, destined to add a very considerable tonnage to their output of copper."

In 1875, the year when Douglas came to Phoenixville, he was elected a member of the American Institute of Mining Engineers, and in June, 1876, he entertained at his works a visiting party of its members. Already, thus early in his career, he manifested the

quality which was afterward so characteristic of him—a great willingness to communicate, as well as to receive, the results of discovery and practice. The Institute, founded to promote this open interchange of professional knowledge, appealed peculiarly to his mind, which disdained to harbor secrets. Through the five years in which he bravely fought at Phoenixville a losing fight, he remained in the Institute; but when that enterprise had failed, and he was obliged to begin again somewhere else, he resigned his membership, the annual expense of which he could not conscientiously afford. But after professional recognition and business success had returned to him, he secured reinstatement in that relationship and thenceforth unto the end was in every way a loyal, potent and munificent supporter of the Institute. I mention this episode of his temporary retirement, because it was influential in the history of the Institute itself. For years after Dr. Douglas had become a leader in its management (he was Vice-president in 1897-8, President 1899-1900, Director from 1905 to 1913, Honorary Member from 1906, and Vice-president of the Board of Directors from 1906 to 1911) he was a strong opponent of the increase of annual dues. Even after the acceptance by the Institute of Mr. Carnegie's gift (involving a heavy land-debt), he was not willing to meet additional expenses in that way. "I remember," he used to say, "when even ten dollars a year was too great a burden for me; and I will not vote to lay a heavier load upon young American engineers."

At the time when Phelps, Dodge & Co. became a corporation, the members of the firm set aside \$10,000 as a gift to Dr. Douglas, in recognition of his past services. But under his earnest persuasion, they gave the money to the Institute land-fund instead, in addition to their earlier subscription of some thousands of dollars. He was himself also at that time already a large subscriber.

This does not exhaust the list of his benefactions to the Institute. After the land-fund had been completed, he gave \$100,000 to the Library; and it is reported in the newspapers that he left to the same object \$100,000 more in his will.

Dr. Douglas in 1860 married Miss Naomi Douglas, daughter of Captain Walter Douglas, of Quebec, who survives him, together with two sons and two daughters: Major James F. Douglas, developer of the United Verde Extension Mine, who is now serving in France; Walter Douglas, who succeeded his father as President of the Phelps-Dodge Corporation; Mrs. Edith M. Douglas, wife of Archibald Douglas, a New York lawyer of extensive mining interests, and Miss Elizabeth Douglas.

Good-by for a while, James Douglas!—unwearied worker, courageous leader, wise counsellor, glad giver, faithful lover and friend—"Douglas, Douglas, tender and true!"

Magistrate Atkinson has handed down a decision in the case recently heard in the Cobalt courts, involving the alleged infringement of the Ontario Land Surveyors' Act by a mining engineer. The decision is against the land surveyors and the mining engineer is acquitted. The decision promises to be far-reaching in effect. The trouble began some three weeks ago when M. P. MacDonald, a mining engineer, was summoned into the Cobalt police court charged with infraction of the Ontario Land Surveyors' Act.

CHROMITE IN THE UNITED STATES

Significant articles have appeared recently in the mining journals concerning a higher and more equitable price to the man who mines and markets the chrome ore used in making ferrochrome now selling at \$400 a ton. The Geological Survey has suggested an increased and more stable price for chromite as a most effective means of increasing domestic production by encouraging and arousing the small producer to do his utmost.

The price of 40 per cent chromite at the beginning of 1917 was \$15 a ton, that is, 37½ cents a unit of chromic oxide, but at the end of the year the price had been raised to 70 cents a unit, or \$28 a ton. The actual price reported to the U. S. Geological Survey ranged from \$10 to \$50 a ton and the average price of the ore sold during the year by producers was a little more than \$24 a ton. Early in 1918 the price for 40 per cent ore reached 85 cents a unit (\$34 a ton). The impending crisis resulting from lack of ships to import the ore needed for war purposes has impelled the principal consumer, the Electro-Metallurgical Co., of New York, to advance prices greatly in the hope of increasing domestic production. The statement of the company was published March 17, 1918, in the form of an appeal, as follows:

To Pacific coast prospectors and miners: The California Chrome Co., which has operated in California and Oregon for the last two years, will contract for the balance of this year for chrome ore at a minimum price of \$1.25 per unit for 38 per cent chromic oxide and upward. Premiums will be paid for early delivery. Advances will be made on good prospects for development work. Settlements in full will be made on independent chemists' sampling and analysis on receipt of bills of lading and weight certificate.

All low-grade chrome ores cannot be concentrated to advantage. This is especially true of low-grade ores in which the chromium has been replaced by aluminum and iron. Chrome ore rich in magnetite may under some conditions be successfully handled by a magnetic separator. Concentrating plants have been a feature of the chrome industry in Canada ever since 1898.

The measure of normal annual consumption of chromite for all the various uses before the war may best be expressed by the sum of domestic production and imports in 1913, about 65,000 long tons. On account of the greatly augmented demands of war conditions it has been estimated by the committee on mineral imports and exports of the Shipping and War Trade

boards that the needs of the United States in 1918 will be equivalent to about 130,000 long tons of 50 per cent ore, of which 67,500 tons will be needed for ferrochrome, 40,000 tons for making bichromates and other chemicals for tanning, etc., and 22,500 tons for refractory purposes.

MOND NICKEL COMPANY.

At the annual meeting of the Mond Nickel Company, Limited, held in London recently, particulars of which are contained in British exchanges to hand, it was shown that owing to the scarcity of labor and material the company had not been able to complete the extension intended. The Chairman, Mr. Robert Mond, said that satisfactory progress was being made in the erection of the fifth unit, and that some steps were being taken towards the erection of a sixth. He said that the management in Canada, not having suffered to the same extent as the parent company in Great Britain, had made much better progress in construction work. In spite of the shortage of labor, the company had not only substantially increased its output of Bessemer matte, but had also been able to put itself in a position to supply for the intended increase of the refining plant. Their supplies of matte in Canada for the refining work had, he said, been brought across the Atlantic without interruption, while the Government authorities had provided the company with the necessary permission to secure the requisite material to maintain the plant in full working order.—The Globe.

RICH ORE FOUND AT LANARK MINE

A rich strike is reported at the Lanark mine, Illecillewaet, B.C., one of the oldest mines of British Columbia. One ore shoot has been uncovered for 350 ft., and the ends are not reached. There are fourteen inches of clear lead and copper ore and four to five feet of concentrating ore running 20 to 25 per cent. lead. The clear ore runs from 50 to 70 per cent. lead and from 40 to 100 ounces silver to the ton, and has been assayed to 248 ounces of silver. The company is running a cut into the shoot 90 ft. deep and \$40,000 worth of machinery is being installed.

Permission has been granted by Mr. George Wilkinson, Chief Inspector of Mines for British Columbia, for the opening of the Jingle Pot Coal Mine, Vancouver-Nanaimo Coal Mining Co., Ltd., which was ordered sealed ten months ago owing to the discovery of fire. In the interim, the mine has been flooded.

We Design Special Equipment for Special Needs

For a quarter of a century we have been designing and building

HOISTING MACHINERY, SMALL CARS, BUCKETS, SKIPS, Etc.

to suit the special needs of the buyer, and with the most satisfactory results to our customers.

The Water Feed---The Big Thing IN CARBIDE LAMPS

The feed must deliver the correct quantity of water to maintain a steady flame, and the lower end of the water tube must be kept clear of the slacked carbide.

The ITP Float Feed supplies just the right quantity, and automatically breaks away the slacked carbide, maintaining a bright, steady, workable size flame from start to finish of charge.

When the valve is opened the water starts to flow at No. 1, the carbide starts to expand, raising No. 4, this carries with it No. 3. The result is the same as when other lamps are raked by hand, with this advantage, the raking is taken care of automatically at just the right moment, the carbide is never vigorously agitated, there is no excess generation and no gas is wasted.

Send us your name and
we'll send you a lamp.

OPPORTUNITIES

--for--

Prospectors and Mining Companies

The mineral wealth of Northern Ontario is enormous. From a few developed areas a very large output of nickel, copper, silver and gold is being made. Many promising areas are awaiting the prospector and miner.

Recently Northern Manitoba has become an important producer of copper ore, and many promising gold deposits have been located. This is an excellent field for the prospector.

One of the greatest factors in development of mineral areas is the provision of transportation facilities. Railways and the mining industry have together played a very important part in the development of several parts of Canada.

The Canadian Northern Railway, recently constructed across Northern and Western Ontario, has opened up for prospecting a large territory. Easy access to many promising areas is now available. Geological maps of some of these areas can be obtained from the Geological Survey, Ottawa.

The Canadian Northern Railway in Manitoba gives access to the Pas Mineral Area. In Alberta the Canadian Northern is serving important coal fields.

WANTED—

Copper Refiner, to take charge of copper cathode melting plant, casting various shapes, including wire bars. A practical furnaceman, who knows from years of actual experience how to fuse in a bottom, how to train a crew of "green" men, and can himself produce marketable copper, can secure a steady position, and a satisfactory salary, with a responsible smelting company. Apply Box N Canadian Mining Journal.

"All the land of the Algoma Central and Hudson Bay Railway Company (except 2½ townships), has been thrown open for prospecting for the period of two years."

No license is required: staking, recording and assessment work practically as on government land. Title in fee simple will be given when work is completed on payment of \$3.50 per acre and a small royalty payable when ore is shipped. For Regulations apply

The Lands Department
Algoma Central & Hudson Bay Rly. Co.
SAULT ST. MARIE, ONT.

FOR SALE—

One Litchfield Holsting Engine, 18 in. cylinder, 32 in. stroke. Two 5 ft. drums with 4 ft. face and grooved for 1 in. rope. In excellent condition. One "WC" Sullivan tandem Air Compressor. Compound steam and two stage air cylinders. Corliss Valve Gear. Capacity 1,800 cu. ft. to 100 lbs. pressure per minute. For full information and price, address:

THE TEMISKAMING MINING CO., LTD.
COBALT, ONT.

PROVINCE OF ONTARIO

BUREAU OF MINES

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium, petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth \$72,093,832, of which the metallic production was \$56,831,857.

Dividends and bonuses paid to the end of 1917 amounted to \$11,486,167.45 for gold mining companies, and \$70,821,829.34 for silver mining companies, or a total of \$82,307,996.79.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.

Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,

Per C. F. BUSS, Superintendent.

THE CANADA METAL COMPANY, Limited

Head Office and Factory **TORONTO**

Branch Factories: **HAMILTON, MONTREAL, WINNIPEG, VANCOUVER.**

We Buy For Cash

**Old Machinery, Metals of all kinds, Shafting
and Rails**

We gather together the various materials and products that have served their purpose in the economic machine and start them over again in new forms through this machine.

Forward us a list of what you have and obtain our prices

BECAUSE WE BUY FOR CASH WE CAN SELL AT ATTRACTIVE PRICES.

Shafting, pulleys, hangers, rails, locomotives, boilers, cars, engines, ore breakers, motors, generators, transformers.

We invite you to test our Service and Prices

RICHARD PEARCE, Editor
Cobalt and Timmins
Canada \$1.50. U.S. & Foreign \$2 yr.

Insure Against Shut-Downs

To keep the coal moving, always with a maximum tonnage at the tippie, calls for an efficient, practical method of overcoming forced lay-ups when machinery breaks. Waste and lost profits result from old-fashioned, time consuming methods for repairing metal parts.

The "preparedness" way is to rely on an Imperial Oxy-Acetylene Outfit. No need to wait days for a replacement of parts. An Imperial, in the hands of your

IMPERIAL WELDING CUTTING EQUIPMENT

OXY-ACETYLENE--OXY-HYDROGEN

A Wonderful Saver of Time, Labor and Expense.
Ready for any Emergency.

Cutting Crank-Shaft

Welding Crank-Shaft

An inexperienced man in 5 hours built up this broken engine crank-shaft and saved \$200.

"There seems no limit to the adaptability of Imperial Equipment," writes the owner.

blacksmith or other capable mechanic, will repair the largest and most complicated fracture within a few hours.

At an insignificant cost, an Imperial Outfit will insure against costly delays. It keeps production at a high peak. Convenient, portable, and always ready for use, it is indispensable as part of the mine's tool equipment.

The Imperial Welding Process has been proven first in Economy, Safety and Efficiency. Welds everything in metal quickly and permanently.

Write today for new catalog containing valuable data on the cost of operation, views of work performed, prices, etc.

CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO

No. 20

Suppose—

you have 100 employees and an old-fashioned time-keeping method

Do you know that in our investigations covering thousands of industrial plants the average loss of time for each employee every time he or she goes in or comes out—usually four times a day—is 2 minutes each time? This is when the time recording system is any one of several old-fashioned plans. Perhaps you think that

is too little to bother about. Let's see. One hundred employees, 8 minutes lost working time every day; 800 minutes daily; 4,400 minutes per week; say 73 hours at say only 40c. per hour, it comes to \$29.20 per week or \$1,518.40 per annum. That's enough good money to buy

International Time Recorders

for THREE establishments with 100 employees each. Remember, we stand on the fact that our calculations above are modest.

Every ounce of mineral you take out of the ground is weighed and checked. Are you half as careful with the labor time you buy—the biggest of all "raw materials" purchases? An International Time Recorder enables each employee to render you a printed, infallible invoice for his time—and he is perfectly satisfied with it because he made it himself.

We make time recording systems to suit any plant—master clocks, recorders, program and whistle blowing devices, time stamps, etc.

Let us send you our latest pamphlets to-day.

A Modern Dial Recorder

Variable Air Power Demand

For air power service in which the demand varies within wide limits, highest efficiency is secured by installing one or more

Sullivan "WN-4" Twin Angle Compound Compressors

Each half of a "WN-4" Compressor is a complete, two-stage machine, with independent air inlet and unloader.

At partial loads the H.P. input per 100 cu. ft. of air remains constant, instead of running up, as with a single large unit.

If you are buying power on a "peak-load" contract, "WN-4" compressors

will cut down your bills for current.

Accurate balance of reciprocating members, End-rolling Finger Valves and Three-Pass Counter Current inter-coolers are other factors which render "WN-4" Compressors so desirable for mining air-power service.

Capacities, 900 to 2600 cu. ft.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

Economy in Coal Mining

The "47" Coal-cutter is economical because:—

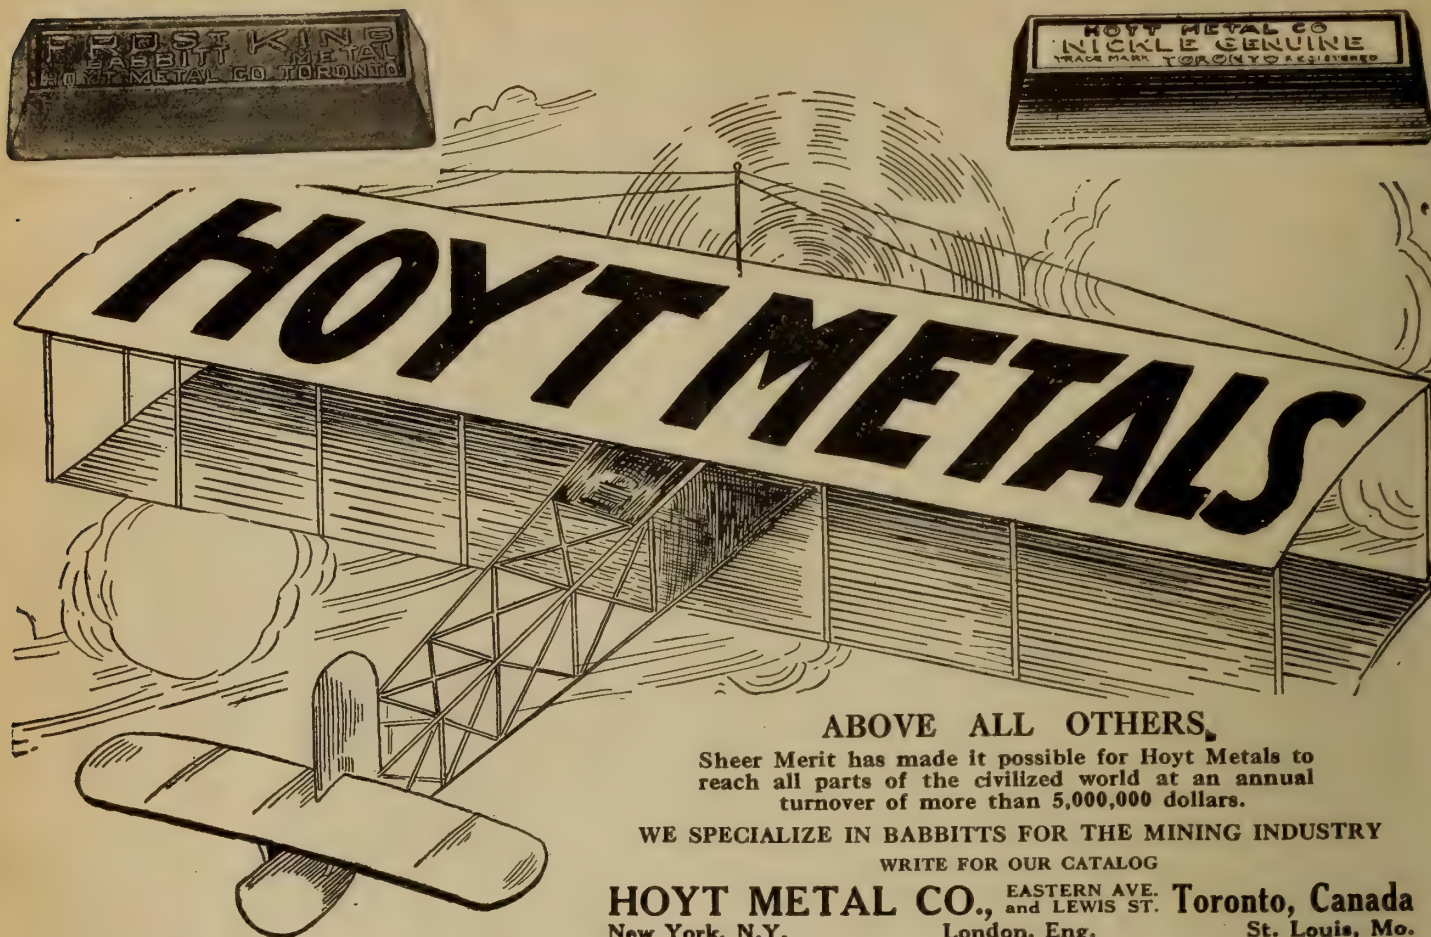

1. The machine itself is no more expensive than the ordinary rock drill.
2. The Radial Coal Cutter can be easily handled and moved from room to room by two men.
3. The special variable stroke of wide range gives high efficiency under all conditions.
4. Low air consumption and small upkeep expense give low running expense.

"TESTED"

The Last Word in Rock Drills

TESTED—the clinching quality or proven durability—means much to rock drill users. It means sure service—a long life for the Drill—and durability wherever used, with no long stops for repairs, because it is proven service.

Hundreds of Cleveland users after a long service of constant use against all conditions have sent back the verdict that for durability, labor and time saving "Cleveland" excels all.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

IRON ORE WASHING PLANTS

There are large bodies of iron ore in Canada too low in iron content to be smelted direct in the blast furnace at a profit, hitherto, but in view of the great demand for steel they are likely to assume economic importance.

The interest of the public in the conservation of natural resources and the interest of owners of such low grade ores will be stimulated by the success of two milling plants installed on the Mesabi range in Minnesota for raising the grade of hitherto unprofitable ores. The ores treated in both mills consist of a mechanical mixture of soft hematite and sand, with boulders of ore and paint rock and some clay, all loosely held together, and breaking up in handling. A full description of the plants is given in Bulletin 1807 which will be sent on request to our nearest office.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG,

Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or, by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

Western Representatives: Kelly Powell, Limited, 403 McArthur Building, Winnipeg.

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,116,103; Lode Gold, \$93,717,974; Silver, \$43,623,761; Lead, \$39,366,144; Copper, \$130,597,620; Other Metals (Zinc, Iron, etc.), \$10,933,466; Coal and Coke, \$174,313,658; Building Stone, Brick, Cement, etc., \$27,902,381; making its Mineral Production to the end of 1917 show an

Aggregate Value of \$595,571,107

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392.

Production During last ten years, \$296,044,925

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

If you wanted to smash rocks, would you first cushion them with water?

Would you break the force of your sledge by splashing it to the bottom of a pool a foot or two in depth?

No, you would not. You would leave those rocks exposed to the full strength of your good right arm.

Now take ore, put it in a mill and hammer it with steel balls. Why should you cushion ore with a lot of water and thus retard the striking and grinding force of the balls, **when you don't have to do it?**

In nearly all types of mills you must drown the ore in order to overflow the fines.

But **not** in the MARCY BALL MILL. It has a dis-

charge end (patented) which is virtually one enormous grate, or grid, from the periphery of the mill to near its centre.

So little water is needed to clear the fines through this generous grate area as fast as they are ground that the heavy steel balls go smash-bang right onto the ore.

There's no large volume of water or mass of trapped fines to hinder production on the MARCY.

In this you see one of the reasons why the mesh ton capacity of the MARCY MILL is so enormously great, and why it is being adopted by important mining companies.

Section of ordinary wet-crushing mill in operation. Note amount of water required to overflow the fines.

MARCY BALL MILL

"One Easy Step"

Section of Marcy Mill in operation. Note low water line. Fines are rapidly ejected, thus keeping mill clear.

The Friends of France

216 Poplar Plains Road,
Toronto

August 20th, 1918.

Canadian Milk Products Limited,
Toronto, Ont.

Gentlemen—Please accept our grateful thanks for your donation of three cases of Klim for French relief work. This generous gift will gladden many a heart in poor stricken France. "A true gift of Providence" is how one writer expresses the value of Klim.

The other day we received a letter from one of the doctors who is working in the front line clearing station who says that Klim is absolutely invaluable especially for gassed men, and he says there is nothing we could send which is a greater help in their work. Klim is used in France for badly gassed and wounded soldiers, for babies, for the sick, and particularly for tubercular patients. Nearly every letter that comes to us from France, whether from refugees, soldiers, doctors or surgeons in charge of hospitals, bears testimony to the value of Klim and brings a request for more. We feel that such remarkable unanimity of opinion proves the worth of Klim beyond any doubt.

Faithfully yours,

THE FRIENDS OF FRANCE.

(Sgd.) Mrs. A. E. Wells,

President.

WANT ANALYTICAL LABORATORY IN CENTRAL B.C.

Mining men of British Columbia want the Dominion Government to establish an analytical laboratory at some central mining point in the Province, and an agitation to this end has been in progress for some time. In the hope that his action may induce the Federal authorities to take this step. Mr. M. S. Davys, of Kaslo, B.C., has offered through the Kaslo (B.C.) Board of Trade to furnish a building for such a mill and it is understood that the municipal authorities would be agreeable to furnishing the necessary electrical power. It is admitted that a laboratory of the kind would be of material service to the operators of the southern interior of the Province.

Mr. Wm. Thomlinson, ore sampler for the Canadian Munitions Board, recently visited Franklin camp and forwarded ore samples to the Dominion Assay Office, Vancouver. While the returns did not demonstrate the presence of platinum in commercial quantities they were sufficiently satisfactory to warrant a closer survey of the entire district.

The Dominion Government has established a platinum camp on Slate Creek, a tributary of the Tulameen near Princeton, B.C. It is in charge of Mr. George E. MacKenzie, of the munitions commission.

The refusal of the miners of the Crow's Nest District to go to work pending an inquiry is sure to react to the disadvantage of coal miners at Fernie and elsewhere. Those who are responsible for increasing the shortage of coal at this time, have little cause to wonder that they fail to secure the sympathy of the public. Miners and operators of coal mines have alike a duty to perform at this time and no differences between them are so great that they should be allowed to retard the carrying on of war work.

It is reasonable to expect that wages should be increased as cost of living and danger in mines increases. It is reasonable also to expect that every effort will be made by both miners and operators to settle their differences without retarding production. It must be admitted that it is not always easy to settle labor disputes, and that one or the other side is often disposed to be unreasonable. It must be admitted by the miners that a serious endeavor is being made to investigate their grievances, and their refusal to work on Mr. Armstrong's terms will convince the public that they are shirking their duty, regardless of consequences. We hope that in the interests of miners generally the miners of Fernie District will take action that will prove that they have been misrepresented. We would like to believe that they have, for otherwise their conduct is a disgrace to the industry.

The great successes of the Allies during the past three months have brought victory much nearer. Few of us had reason to expect that success would come so soon. It was confidently expected that victorious advances would come in the spring of 1919; but already the change has come over Europe.

Great activity in the mining and metallurgical industries must follow the war. While a great endeavor has been made to keep up production of minerals and metals during the war, there has been greater consumption than production. The period of reconstruction will make great demands on our basic materials. During the war the shortage of men, machinery and supplies and their high cost has imposed serious handicaps on the mines, they have done well under these handicaps and it is certain that they will do better under normal conditions.

Very successful results are being obtained at Quyon in treating molybdenite by the flotation process. At Cobalt the flotation process is a great boon to operators, and is making possible the recovery of silver from low grade material at a time when the price is good. The mining industry in Canada, as elsewhere, owes more to those who invented and developed the flotation process than is generally acknowledged.

The Reports of the Resident Engineers of B. C.

By E. Jacobs.

The Annual Report of the Minister of Mines of British Columbia for the calendar year 1917, issued recently, includes the following official comment:

"During the session of 1917 the Hon. the Minister of Mines brought in the 'Mineral Survey and Development Act,' which was passed on May 19, 1917, and under the provisions of which the Province was divided into six Mineral Districts, to each of which there was appointed a Resident Engineer with headquarters at a centrally located point in such district.

"In the district to which he was appointed the Resident Engineer is expected to devote his whole time to the performance of the duties of his office, and to carry on continuously a mineral survey of his district, keeping records of the same, and of the mining and mineral developments taking place, and at the same time to assist prospectors and others with such advice as may be necessary and may come within the scope of a mining engineer's work.

"Aside from special reports which may be called for by the Minister, the Resident Engineers are expected annually to make a comprehensive report covering all matters relating to mining, mine development, and prospecting that have occurred within the year in their respective districts.

"These annual reports of the Resident Engineers are given later in this general report, and form the basis of the information given in respect to the mineral industry and its development within the Province.

"As the Resident Engineers did not take office until the season of 1917 was well advanced, and as the work was new to many of them, their reports are not as complete or comprehensive as they probably will be next year."

The value of mineral production in 1917, and the total value for three years 1915-1917 as shown in the last Annual Report, were as under:

VALUE OF PRODUCTION, 1917

District	Metallic	Non-metallic	Total
No. 1—Northwestern.....	\$8,405,696	79,742	\$8,485,438
No. 2—Northeastern.....	525,641	4,256	529,897
No. 3—Central.....	333,822	540,791	874,613
No. 4—Southern.....	4,191,960	62,005	4,253,965
No. 5—Eastern.....	8,970,491	2,058,836	11,029,327
No. 6—Western.....	4,856,864	6,980,288	11,837,152
Totals.....	\$27,284,474	\$9,725,918	\$37,010,392

TOTAL VALUE OF PRODUCTION FOR THREE YEARS, 1915-1917.

District	Metallic	Non-metallic	Total
No. 1—Northwestern.....	\$19,968,211	\$149,164	\$20,117,375
No. 2—Northeastern.....	2,178,300	15,256	2,193,556
No. 3—Central.....	737,084	1,326,252	2,063,336
No. 4—Southern.....	15,681,912	188,679	15,870,591
No. 5—Eastern.....	30,195,649	8,709,138	38,904,787
No. 6—Western.....	11,348,981	18,249,736	29,598,717
Totals.....	\$80,110,137	\$28,638,225	\$108,748,362

The various mining divisions included in the several Mineral Survey Districts are:

In No. 1—Northwestern District—Atlin, Stikine, Liard, Skeena, Portland Canal, Bella Coola, and Queen Charlotte.

In No. 2—Northeastern District—Omineca, Peace River, Cariboo, and Quesnel.

In No. 3—Central District—Clinton, Lillooet, Kamloops, Ashcroft, Nicola, Vernon, and Yale.

In No. 4—Southern District—Similkameen, Osoyoos, Greenwood, and Grand Forks.

In No. 5—Eastern District—Golden, Windermere, Fort Steele, Ainsworth, Slocan, Slocan City, Trout Lake, Nelson, Arrow Lake, Revelstoke, Lardeau, and Trail Creek (Rossland).

In No. 6—Western District—Nanaimo, Alberni, Clayoquot, Quatsino, Victoria, Vancouver, and New Westminster.

The Northwestern District.

The report of the Resident Engineer for the Northwestern District may be fairly adjudged the best-balanced and generally the most commendable of the lot. It is an excellent report, giving prominence to the most important things, wasting little or no space on unimportant ones, and treating briefly, but sufficiently, with regions and properties of promise. Where there was no opportunity to visit an important part of the district, as in the case of the Atlin gold field, a summary of results was obtained from the district Gold Commissioner, and included in the report. Bibliography and lengthy disquisitions on geology are left out, and instead useful general information is given, so that prospectors and miners are not confused by much technical detail. Most space is given to the important copper mining and smelting enterprise established in the district by the Granby Consolidated Co., the incorporation in the report of a comprehensive description—fully authentic since written by one of the company's prominent officials—being timely and of particular value to those desirous of knowing what progress has been and is being made by that company in that part of the province. Further, the mention of the company's exploration work and prospecting activities on Klekane inlet, Gibson island, Ecstall river, Portland canal, Bear river, and elsewhere, in its search for new mines, indicates the extending enterprise of this company.

The account given of the gold-mining property of the Belmont-Surf Inlet Mines, on Princess Royal island, is also of much interest. The mine, concentrator, hydro-electric power system, and plant and equipment generally are described, and the importance of this recent addition to the gold producing mines of the Provinces made clear.

The considerably improved outlook for the Portland Canal mining division is shown in the valuable information given relating to the Georgia River and the Salmon-Bear River mines; attention is directed to promising magnetite properties on Seymour inlet; information accounting for the delay in shipment of ore from Alice arm of Observatory inlet, from which a considerable production has been expected, is supplied; and summaries of the situation in various other parts of the district are also included in the report.

The illustrations in the general report that have relation to this district all have a practical bearing on matters dealt with in the text. The sketch map of the Salmon River district in Portland Canal division, is informative and useful, while the plans and views of the Granby Consolidated Co.'s properties—some of which should have appeared in the 1916 report, since many photographs were available early in that year—serve to impress those who have not visited Anyox or the Hidden Creek mine with the extent of the company's operations and the substantial character of its mining and smelting undertakings.

It is a pity that errors in figures occur. On one page, it is stated, in the Engineer's report that "the district in 1917 produced 822,819 tons, of which 784,000 tons was mined and smelted by the Granby Company, of Anyox,

which tonnage includes the low-grade quartz mined for use as flux." On another page the statement is made that the tonnage of ore mined and smelted was about 784,000 tons, averaging 2.12 per cent. copper, the gold and silver amounting to approximately \$240,000. The tonnage of low-grade quartz ore mined was about 37,000 tons, or a total of 812,000 tons." Again, it is stated on one page that the Belmont-Surf Inlet Mines Company shipped to the Tacoma smelter 722 tons of table and flotation products, and on another page after stating that production is 25 to 30 tons of concentrates in 24 hours it is added that "the company will have shipped in 1917 about 1,700 tons, and expects to have a steady output of between 800 and 900 tons a month." In the general report it is printed that the district output was 821,819 tons and that the Granby Company treated "approximately 784,000 tons of ore, and in addition 38,000 tons of quartz flux and 53,000 tons of limestone flux."

Aside from these minor blemishes, though, the report is a most creditable one, and appears to measure more up to the stated requirements of the "Mineral Survey and Development Act" than any of the others also included in the general report.

Northeastern District.

The production of ore, in the Northeastern District, as shown in the official records, during the last three years was as follows: In 1915, 17,545 tons; in 1916, 17,752 tons; in 1917, 4,159 tons. The recorded value of the mineral production was: For 1915, \$885,502; for 1916, \$778,157; for 1917, \$529,897; total for three years, \$2,193,556. Of this total, \$2,178,300 was for metalliferous minerals. The decrease in value for 1917 was 32 per cent. as compared with 1916 and 40 per cent. with 1915.

In the report of the Resident Engineer it is stated that: "The mineral production of the Northeastern District for 1917 was a little less than in the year 1916. The principal reason for the decrease in value of output was, first, a smaller production of placer gold in all parts of the district, and, secondly, to the fact that the two principal lode mines—the Rocher Deboile and Silver Standard—were only shipping during one-half of the year. Both these mines are in shape, however, to make a good production in 1918. There were, however, a greater number of small shippers in 1917 than in any previous year, which is an encouraging sign for the future." The individual shippers of more than 100 tons of ore were as follows: Rocher Deboile, 2,889 tons of copper ore; Silver Standard, 671 tons of silver-lead-zinc ore; Santa Maria, 239 tons of copper-silver ore, and the M. & K., 123 tons of silver-lead-copper ore. Eight other properties together shipped 237 tons of ore containing silver, copper, and lead. The quantities and value of the minerals were: From Omineca division: Placer gold, 600 oz., \$12,000; lode gold, 931 oz., \$19,244; silver, 82,311 oz., \$63,668; lead, 271,885 lbs., \$21,506; copper, 852,373 lbs., \$231,675; zinc, 364,097 lbs., \$27,548, and miscellaneous materials, \$1,500; total, \$377,141. From Cariboo division: Placer gold, 6,750 oz., \$135,000, and miscellaneous materials, \$2,756; total, \$137,756. From Quesnel division: Placer gold, 750 oz., \$15,000. Total value for the whole of the Northeastern District, \$529,897. A little more than 75 per cent. of the lode-mineral production of the district came from the neighborhood of Hazelton, and the remainder from the Skeena River and Telkwa sub-districts.

In fairness to the Resident Engineer it should be pointed out that in having to report on a district containing nearly 100,000 square miles of territory in which last year there were only four mines that shipped more than 100 tons of ore each, and only one with an output of more than 1,000 tons, and in which there has been a steadily diminishing production of placer gold in the last two years, his field for comment of value is not of the best. Under

the circumstances, perhaps it would have been better for him to have placed more emphasis on the few points of general interest and condensed his report accordingly.

The list of the more important published official reports on the geology and mineralogy of the district is of value. Brief particulars of several miscellaneous minerals—scheelite in Cariboo division, and molybdenite and peridots in Quesnel division—are noteworthy. Information concerning many more or less developed mining properties, few of which, though, have yet reached the productive stage, will be handy for reference and so will be welcomed by many interested in the district. On the whole, however, the mining industry of the newer parts of the district has not yet made sufficient progress for this report to possess nearly so much value to the general public as one on a rapidly progressive mining district would do.

The Central District.

As regards mineral production, this is the least important district in the province, for the total value of its output in 1917 was only \$874,613, or less than two and one-half per cent. of the total for the province for the year, and less than two per cent. of that of the three-year period, 1915-1917. This would not seem, though, to be a sufficient reason for the quite inadequate report of the Resident Engineer, the text of which fills not quite eleven pages, and makes little or no reference to the more important mining operations carried on the district, nor to minerals that might well have had attention. This is to be regretted; for the mineral potentialities of the district are consequently not even fairly presented, when under the handicap of such limited production it might have been expected that the most would have been made of the opportunity to prepare a reasonably fair and full account of them.

Having in view the official statement that "Resident Engineers are expected annually to make a comprehensive report covering all matters relating to mining, mine development, and prospecting that have occurred within the year in their respective districts," it is evident that this requirement was in some comparatively important respects lost sight of by the local official.

The Southern District.

The Resident Engineer of the Southern District may be said to have erred just as much in the matter of brevity as did his co-officials of the Northeastern and Western Districts in the opposite direction. The disproportion already pointed out is markedly noticeable when it is taken into account that only ten pages of text are devoted to the Southern District with a metalliferous production of a total value of \$15,681,912 for three years, 1915-1917, which was nearly twenty per cent. of the grand total for the province for that period, while the Northeastern District has five times as much space notwithstanding that its three-years' output was less than three per cent.

One of the reasons that the report of this District does not measure up to what might have been expected is that there seems to be lacking a recognition of relative value of available information. The particulars given of the Similkameen District, for example, seem to indicate this. A small silver property, which shipped in 1917 about 320 tons of ore is given twenty-nine lines, while the Hedley Gold Mining Co.'s operations, which included the mining and milling of 71,207 tons of ore, are disposed of in five lines, and those of the Canada Copper Corporation, which is stated in the report to have expended on its big property on Copper mountain about \$1,250,000, are dealt with in twenty-two lines.

Notwithstanding its shortcomings, the report on this District is a useful though short summary, and will be read with interest.

The Eastern District.

The Eastern District is the most important metalli-

ferous mining district in the Province, embracing as it does the whole of the Kootenay, both East and West. An official list of all metalliferous mines in British Columbia shipping in 1917 shows that out of a total of 199 the proportion of East Kootenay is 15, and of West Kootenay 87, together, 102. In addition its coal mining industry is important, though in quite recent years less productive than several years ago; last year its gross output of coal was only 23 per cent. of that of the whole Province, as compared with 35 per cent. in 1916 and 44 per cent. in 1914. Its area is so large and its mining activities so varied and extensive that it is hardly reasonable to expect a single Resident Engineer to do it justice. Yet an endeavor was made to give more or less attention in the published report of that official to every one of the twelve mining divisions the District embraces. It seems a pity, though, that with such a favorable opportunity for giving a fair outline of the more striking features of mining and metallurgy in the District, much much prominence is given to comparatively unimportant properties than to large producers, the latter generally including those that have done, even during the year covered by the report, underground development in connection with which comment of great practical usefulness might easily have been made, and have conducted metallurgical operations that might well have been described even if only briefly. But in this report, as in nearly all the others, much more attention seems to have been given to properties, some of them in outlying regions, in connection with which applications had been made to the Government to spend money in wagon-road or trail making, than to those that are largely the mainstay of the mining industry in their respective districts. A number of instances might be cited where the sense of proportion or of appreciation of relative value seems to have been quite lost sight of. This is most noticeable in the case of the Sullivan lead-zinc mine, in Fort Streele division of East Kootenay, which is shown to have shipped 112,000 tons of ore and the development work done included extending "the new double-track tunnel" 3,000 feet, which tunnel "when completed will give an additional depth to the present workings of 700 feet, and will greatly reduce the present cost of handling the ore;" yet this big zinc-lead mine—the only one in the Province operating a "mucking" machine—was given eight lines of space, while a quite unimportant outlying group of minerals claims in Golden division, respecting one of which the report states "no ore bodies which could be considered of commercial importance have yet been opened up," and of another "it is a prospect upon which further work may possibly disclose ore in larger quantities than have as yet been found, but it is not considered that present conditions justify any heavy expenditure," has devoted to it nine or ten times as much space.

The Western District.

The report of the Western District may be designated the report of "the writer," for that expression is used in it seventy-seven times, which is about fifty times more than in the case of another Resident Engineer who also has a weakness in a similar direction. Its considerable length is easily accounted for when it is seen that "the writer" spread himself by filling eight pages with his "Outline of the Report," "Bibliography," and "Introduction."

Notwithstanding, though, that the Resident Engineer for this District gave a facile pen full play, and that needed editing was not done, there is much of interest in his report. The bibliography of the geology and mineralogy of the District, which should long since have been compiled and published by the Provincial Bureau of Mines, will doubtless prove of value to those seeking information on those matters. The information relative to copper ore deposits being developed in Victoria mining division will interest many, in the southern part of the District especially. The account of the extensive under-

ground workings of the Britannia copper mines, and the summary of the equipment and the plans of a 1,000-ton unit of its big concentrating mill are timely and of value for reference. Generally, the particulars of numerous mining properties in various parts of the District, though they might with advantage have been considerably condensed, will be welcomed by those giving attention to mining in the Southern Coast District.

In conclusion, the opinion may be expressed that as a whole the first annual reports of the Resident Engineers are not of a character to induce other Provinces of the Dominion to follow British Columbia's example in this direction. As has already been stated, the report of the Resident Engineer for the Northwestern District (No. 1) is a most creditable one; it keeps within the limits officially outlined and may well be regarded as a model that other Resident Engineers can learn from, whether their weakness be that of undersirable brevity, or the other extreme of considerable prolixity. It is certain that Ontario Mines Department officials have little to learn from these reports, in either relative proportion in dealing with various mining properties, or in the general character of the original comment made upon them. Nor are Dominion Mines Department officials likely to discover in these reports leads that they may follow with advantage. Whether or not the future will see the marked improvement that may reasonably be looked for will probably depend largely upon the adoption by the Provincial Department of Mines of method and system for future reports, or a continuance of the inaugural "go-as-you-please" style which has not proved a signal success.

WILL OPERATE WOOLSEY CLAIMS.

The Woolsey Group of mineral claims, situated on Silver Creek, a short distance from Revelstoke, B.C., have been bonded by Calgary, Alberta, financial men, for a substantial sum. Extensive development work will be undertaken immediately. The ore is silver-lead and is said to be very high grade, a test shipment being reported to return 137½ ounces silver and 73 per cent. lead to the ton, with a trace of zinc. A road is to be constructed to replace the present trail to the mines and a bridge to connect with the latter is promised over the Illecillewaet River.

CHANGES IN FRANKLIN CAMP.

Considerable stir is reported from Franklin Camp, near Grand Forks, B.C., The Maple Leaf Group, a well-known property on which considerable development work has been done and a sample shipment from which gave substantial returns in copper, gold and silver, has been bonded, according to announcement from that district, by Mr. H. W. Holly, of Winnebago, Minn., representing Chicago, Ill., financial interests. The Union Mine also is expected to be transferred under bond to American interests, negotiations being in progress, while mining engineers have been inspecting the Pathfinder, of the same section, with the same object in view.

It is reported that the Woolsey group of claims on Silver Creek east of Revelstoke have been bonded and that a large force of men will be put to work at once. The ore is high-grade silver-lead.

Mr. Charles Camsell, head of the British Columbia branch of the Geological Survey of Canada, is in the Bridge River country gathering information on mining development in order to bring up to date the report on that district, which is in course of preparation.

Ontario Mining Officials Visit British Columbia

Mr. T. Ernest Godson, Mining Commissioner for the Province of Ontario; and Mr. T. F. Sutherland, Chief Inspector of Mines for the same Province, are paying a visit to British Columbia for the purpose of making a general but close investigation of Western mining conditions.

Mr. Godson is chiefly concerned in the judicial aspect of the mining regulations. While in British Columbia disputes over mining properties are decided in the courts, in Ontario he, as Mining Commissioner, adjudicates between the parties at odds, an appeal from his decision to the Court of Appeal being open to the dissatisfied party. Some differences between the British Columbia and the Ontario regulations are referred to by Mr. Godson. There, before a claim can be recorded, it must consist of a discovery of "valuable" mineral in place, as contrasted with the requirement here of "mineral in place." The Ontario definition, he explains, is supposed to prevent what is known as blanketing a considerable section, but just how far it does so is a moot question. In Ontario, too, the Crown Grant carries everything, including surface rights, and the system of British Columbia of either work or payment on the part of the locator to cover annual assessment duty does not exist. The actual work must be done by the locator, the alternative of payment being not permitted. While unable as yet to make a full study of the mining regulations of British Columbia, Mr. Godson is of the opinion that those of Ontario are the best in existence in the Dominion of Canada, are more elastic than those of other Provinces, and meet the situation as far as possible. While in Winnipeg, Mr. Godson made a study of the new regulations which are being drafted consequent upon the expected early handing over to that Province by the Dominion of the mineral lands now held by the latter. There, as elsewhere, throughout the country, he states, there appears to be a growing sentiment in favor of the elimination of the existing system of issuing Crown Grants of mineral claims to parties who comply with the requirements as to development, etc., and the inauguration, in its stead, of a system whereunder the Government would retain perpetual ownership of their mineral lands, only granting leaseholds on liberal terms, with a penalty of forfeiture if the terms are not complied with.

Chief Inspector Sutherland is making a personal inspection of the larger mines of the Province and already has visited the underground workings of the mines at Anyox, B.C., of the Granby Consolidated Mining & Smelting Co., as well as those of the Britannia Mining Co. Both are on their present tour at the suggestion of the Hon. Mr. Ferguson, Minister of Mines of Ontario, with a view to obtaining all information available as to mining conditions in other sections of Canada for their guidance in effecting improvement in their home Province. Respecting mining conditions in Ontario at present, Mr. Godson says that mining is very active, especially in silver, copper, nickel and other metals, but that the gold producing mines are affected similarly to those of British Columbia and other parts of America. Like other Provinces, Ontario since the outbreak of the war has taken steps to protect the interests of the men overseas on active service and those holding mining licenses and interests have been given every protection pending their return.

The Hon. Frank Cochrane has been appointed acting Secretary of State and Minister of Mines during the absence of Hon. Martin Burrell, who is taking an extended vacation.

FLUORITE NEAR GRAND FORKS.

Diamond drill exploration on the "Rock Candy" property of the Consolidated Mining & Smelting Co. near Grand Forks, B.C., are understood to have disclosed a body of fluorite exceeding expectations. Meanwhile work is proceeding in preparation for substantial shipments, and an extension of the Kettle Valley Railway above Lynch Creek to connect with a tramway from the property is projected, thus facilitating the economical movement of ore.

Considerable ore has been proved up in the Drum Lummon Mine, Douglas Channel, B.C., since the installation of a new compressor plant. A concentrating mill of the Gibson type now is being constructed.

DEVELOPING EPSOMITE DEPOSITS NEAR CLINTON, B.C.

Two Vancouver companies are developing deposits of epsomite near Clinton, B.C., which have been reported upon by a competent mining engineer. The only production of epsomite in British Columbia hitherto has been from the Spotted Lakes in the Osoyoos Mining Division, where twenty men were employed last summer collecting it from the shores of these lakes, where it crystallizes, and shipping it to the United States. The output was about 900 tons from that locality.

TESTING PLATINUM ORE FROM OLIVINE MT.

The Olivine Mountain Syndicate of Vancouver has shipped two tons of ore containing platinum from Olivine Mountain, Tulameen, to the Faust concentrating plant, Seattle, Wash., for testing purpose, with a view to ascertaining whether the metal can be extracted in sufficient quantity and at a low enough cost to make the operation of the property profitable. If so the syndicate plans the installation of a plant at Tulameen to undertake the production of platinum from the dunite which carries the mineral along with gold, copper and microscopic diamonds.

ERECTING PLANT FOR CANADA COPPER.

Mr. H. R. vanWagener, of Denver, Col., comes to the general managership of the Canada Copper Corporation at an interesting period. The newly developed properties at Copper Mountain near Princeton are the scene of considerable activity. A concentrating plant to cost one half million dollars is in course of erection, and steel will be laid on the Kettle Valley Railroad branch line to this point in a few weeks. It is expected that the entire line to Copper Mountain, eighteen miles south of Princeton, will be finished by mid-summer next. Electric power is to be obtained by an extension of the West Kootenay Light and Power Company's line from Greenwood, and work has been started at clearing the right of way and building roads for the 150 mile extension.

The Harewood mine at Nanaimo recently re-opened by the new owners, the Canadian Western Fuel Company, is producing from the new workings what is claimed by officials of the company to be the best class of steaming coal on Vancouver Island.

Crow's Nest Pass Miners Stay Out

Victoria, Oct. 1.—The Coal miners of Fernie and Michel, B.C., Crow's Nest Pass Collieries, are still on strike. It was thought that when it was ordered by Mr. W. H. Armstrong, who is appointed by the Dominion Government as Director of Coal Operations in the United Mine Workers of America District No. 18, that the company should open its mines on the single shift system, and that the Minister of Mines for British Columbia should be requested to appoint a Royal Commission to investigate and report as to whether the adoption of the one shift in twenty-four hours will make the mines safer than the double shift rule, the men would go back to work without further delay. That, however, did not happen. When the men had the proposition put before them on Monday, September 30th, they voted it down solidly.

What will be the next move? This is the question interesting those who have been watching developments. Mr. Armstrong admittedly is confronted with a serious situation. Several of British Columbia's most important coal mines are idle and the continued lack of output would have the effect of depriving a number of large and, at the present time, essential Western industries of the coke necessary to keep their plants in operation. The company which first comes to mind as being placed in this position is the Trail (B.C.) Smeltery, Consolidated Mining & Smelting Co. of Canada. Last year it suffered when the Fernie strike, following the explosion of April, 1917, occurred and the authorities are determined that such a difficulty will not arise again. Moreover, Mr. Armstrong has taken a step which is pretty definite, having invoked the very extensive authority placed in his hands by the War Measures Act of Canada under the terms of which his appointment was authorized. It is interesting, in this connection, to reproduce the text of Mr. Armstrong's order, which follows:

"A request has been received from the miners employed at the mines of the Crow's Nest Pass Coal Company, Ltd., at Coal Creek and Michel, for the adoption of a single shift in all the mines instead of a double shift as at present. This request is based upon what is alleged by the men as 'the dangerous condition of the mines' due to working double shift.

"The question of the safety of the above mentioned mines is one that comes under the regulations of the Coal Mines Regulation Act of British Columbia, and therefore, comes within the jurisdiction of the Department of Mines of that Province, and not under the jurisdiction of the Director of Coal Operations.

"The issue as to whether or not the operation of those mines would be more dangerous on a double shift than on a single shift is one upon which the representatives of the men and the company disagree.

"However, in view of the difference of opinion which has developed I hereby instruct the Crow's Nest Pass Coal Company, Ltd., to install a single shift system at their mines and will request the Minister of Mines of British Columbia to appoint a Royal Commission as proposed by him to determine the question at issue. The Commission to report without delay when the matter under dispute will again be reviewed.

"It is further understood that the single shift system does not apply to development places nor to necessary repairs in the mines.

"By virtue of the authority vested in me by order of the Committee of the Privy Council, passed under the provisions of the War Measures Act of Canada, 1914, I hereby direct the foregoing conditions shall be in force and effect at the mines of the Crow's Nest Pass Coal Company, Ltd., until further notice."

W. F. ARMSTRONG, Director of Coal Operations.
Calgary, Alberta, Sept. 27th, 1918.

Some difficulty is being experienced in understanding the attitude of the men in refusing to endorse such a proposal as it grants them that for which they struck, namely, the single shift, without insisting that any condition or conditions be accepted. The only explanation ventured is that they object to the proposal that the Provincial Government appoint a Royal Commission as indicated.

In the face of this deadlock there seems to be only two courses open: first, the granting of the men's demands as set out by themselves without reservation or qualification of any kind. Second, the continuance of the fight. The adoption of the latter course according to officials of the U.M.W. of A. would mean the calling out of all the coal miners of District 18, affecting probably some 9,000 men. What action Mr. Armstrong would feel called upon to take in such a case is hard to say, but it is significant that the military can be empowered to enforce orders given under the War Measures Act if necessary.

Hon. Wm. Sloan, Minister of Mines for British Columbia, returned recently from Calgary where he engaged for a week in conference with officials of the U.M.W. of A. and representatives of the company in an endeavor to come to some amicable and satisfactory adjustment of the issue. All proposals made by him, however, were without avail and finally he requested Mr. Armstrong to take the matter in hand. The result was the order quoted.

In discussing the matter subsequently, Mr. Sloan explained that District 18, so-called, includes the Eastern section of British Columbia and the whole of the Province of Alberta. It was a division of the Canadian coal mining fields for which the U.M.W. of A. was responsible. Within its limits, he pointed out, there were fifty-one shipping mines and forty-two Local Unions, three of the latter being in this Province and thirty-nine in that adjacent.

Referring to Mr. Armstrong's services in this District, Mr. Sloan paid him a very high compliment. Since taking office, Mr. Armstrong had contended with many problems, both serious and trivial, and had handled all with consummate tact and judgment, bringing about satisfactory understandings in each instance. Through his efforts and influence the coal output of the District for the first six months of this year had exceeded that of the same period of 1917 by 1,060,000 tons.

An adequate supply of steam fuel, Mr. Sloan thought, was assured for the winter, and he did not believe that there was occasion for undue alarm with regard to the domestic fuel reserve for the prairies during the next few months. It was the effect the strike would have on the coke supply that was most to be feared and it was this that made a settlement of the trouble imperative.

Incidentally the Minister of Mines asserted that, in his judgment, the Eastern British Columbia and Alberta fields were the "coal cradle" of the American Continent, and would be the scene of the greatest mining activity of any American section in the course of the next few years.

A two-room addition to the Creighton Mine school is under construction by the Laberge Lumber Co., Limited, to be ready for occupation by the end of October. The addition is a continuation of the design and construction of the present school building, is of brick veneer with stone basement, and will be modern throughout, and when completed will give Creighton a six-room school. There are now 462 children of school age in Creighton Mine.

A high grade copper ore is being shipped to the Tacoma Wash. Smelter by the Monitor Mine, Vancouver Island, B.C., and it is proposed erecting a concentrating mill.

LUCKY JIM RE-ORGANIZED

The new directorate of the Lucky Jim Mines, Limited., has issued the first financial statement issued to stockholders since 1914. For many years the affairs of the company have been tangled due to the over-issue of stock by Mr. G. Weaver Loper, former managing-director and transfer agent, who now is in jail in Spokane, Wn., following charges made by the prosecuting attorney. This statement shows that from April, 1914 to April, 1918, the income was \$249,874 of which \$228,161 was from ore shipments made by Mr. A. G. Larson as trustee. Of income \$20,680 was from loans. Expenditures totalled \$246,721, leaving a balance of \$2,653, with \$14,966 paid to trustees, \$6,142 to creditors, \$32,822 first mortgage retired, and \$20,149 paid as interest upon mortgages. Office expenses for the period were \$15,703 and operating expenses \$155,975. Listed as over-issued shares an item of \$2,999,899 was shown on the balance sheet and \$2,121 was shown as due from smelters. Liabilities included debentures to the amount of \$6,200, \$38,087 due on second mortgage, \$27,004 accounts payable, and \$18,533 for loans. The total assets were \$5,533 with indebtedness of \$71,291, or a net deficit of \$65,758.

The company has issued the following statement with reference to past difficulties and future plans:

"The quantity of ore produced could have been very materially increased if this company had owned a concentrating plant. At the time the receiver was appointed the only mill available was one situated at Sandon, B.C. Some ore was sent to this mill for treatment, but unfortunately before this ore was treated the mill was destroyed by fire and it became necessary to look elsewhere for milling facilities. Fortunately the receiver was able to make a contract with the lessee of the Roseberry mill to treat our ores and the first concentrates were produced by this mill the latter end of October of the same year. This mill was operated by the lessee until October last year when it was taken over by the Surprise Mining Company. During the period it was in operation by the lessee about 16,000 of crude ore was treated. September, 1916, the customs concentrator at Kaslo commenced operations and a quantity of middlings was transferred from the Roseberry Mill to the Kaslo Mill for magnetic treatment. Two months later this mill commenced concentrating and treated about 6,000 tons of crude ore for this company during the period it was in operation, but, owing to circumstances it closed down January last, thus leaving the mine without any concentrating facilities. Neither the Roseberry nor the Kaslo mill was satisfactory as owing to lack of necessary equipment, the efficiency was considerably below what it should have been, resulting in low extraction; while, on the other hand, the milling costs were much higher than if the ore had been treated in the company's own mill. Had the price of zinc been maintained it might have been possible to continue but at the present price it was impossible to pay the high treatment charges and make any profit on the ore.

"Efforts are being made to raise sufficient money to erect and equip an up-to-date mill on the property of the company.

"You are aware that on the 12th of January last, an extraordinary general meeting of the members was held in Victoria and the capital stock of the company increased from \$2,500,000 to \$6,000,000, said action being confirmed by a subsequent extraordinary general meeting held on the 2nd February last.

"The reasons your directors called these meetings for aforementioned purposes were as follows:

On taking office in December, 1916, they found it was not possible to prepare a financial statement or have an audit made of the books of the company on account of the

refusal of Mr. G. Weaver-Loper, late vice-president and managing director of the company, to turn over the books and documents of the company to the present secretary. An application was, therefore, made to a judge in Spokane for a writ of mandamus to compel Mr. Loper to deliver said books and documents, also three thousand debentures or bonds amounting to \$150,000 of the company held by him. Said writ was issued but Mr. Loper appealed against the same.

"Last year F. P. Green, certified accountant of Spokane, was instructed by the board to make an audit of the transfer books. This audit and a subsequent audit disclosed an over issue of approximately 3,000,000 shares. Upon completion of aforementioned audit your directors called an informal meeting of members in Spokane, representing a majority of the shares issued, and after consulting the best legal authorities in British Columbia and Spokane, they were advised that to avoid litigation the only thing to do was to increase the capital stock to \$6,000,000 to cover said over-issue.

"At the time the conditions above mentioned were exposed, Mrs. Fannie G. Loper, wife of G. Weaver Loper, late vice-president and managing director of the company, had a suit pending against the company in the sum of \$220,644, covering a claim of G. Weaver Loper for \$73,340 contained in the last financial statement issued to members; certain salary and expenses of administration amounting to about \$30,000 and sundry other claims of which your directors have no knowledge. On the 27th of November, 1917, an assignment was obtained from Fannie G. Loper and G. Weaver Loper of all their claims against this company, surrendering all or any property of said company in his possession and in addition to the above an affidavit was also made by Fannie G. Loper and G. Weaver Loper of which the following is an excerpt:

"That no person or corporation has any claim of any kind, nature or description against the company on account of any matter or thing whatsoever, and especially on account of any stock, share or shares of stock, certificate or certificates for share or shares of stock other than is shown by the audit of the transfer books and subsequent audit made by F. P. Green, of Spokane, Wn."

"On the 15th of March last, a meeting of directors was held at which it was resolved to issue to A. M. Wolverton, of Vancouver, debentures aggregating \$6,200 in respect of his garnishee proceedings in re Wolverton vs. G. Weaver Loper, said Wolverton giving the company a release of all claims under said judgment.

"A resolution was also passed authorizing the officers of the company to take up and cancel all the shares shown to be out-standing by the audit before mentioned and to issue in lieu thereof new stock, share for share and to re-number all such certificates and shares beginning with one (1) and so on until all the stock has been re-issued."

Ottawa, Oct. 8.—Word has been received at the Department of Labor that the coal miners who have been on strike in the Crow's Nest Pass region voted to return to work on the lines laid down in an order issued by W. H. Armstrong, Director of Coal Operations in the West. Work, it is stated in the communication received by the Department, was resumed this morning. The men have been out for nearly a month.

J. Murray Clarke, K.C., in National Progress, claims that the decrease in gold production on the Continent is due to German propaganda. The German government, he says, voted \$250,000,000 for the purpose of interference with Allied production, and the United States government has traced the expenditure of \$90,000,000 in that country, partly in the purchase of newspaper support. The German government worked through the I. W. W.

Milwaukee Meeting of Mining Engineers

Milwaukee, Wis., Oct. 9th.—A clarion call to conserve tin, which may be heard around the world, was sounded here to-day at a meeting of the American Institute of Mining Engineers when representatives of the Government and many of the country's largest firms conferred.

Collect tin for our use, substitute other metals for tin whenever possible, and discontinue the manufacture of tin-consuming products non-essential to the winning of the war. These were the advices made public after the conference.

Those in attendance represented the War Industries Board, National Lead Company, Pennsylvania Railroad, U. S. Bureau of Standards, American Sheet and Tin Plate Company, Westinghouse Electric and Manufacturing Company and several scores of others.

Conserving tin was the principal subject of the conference, together with a study of means for increasing the by-products of coke and the fuel supply in the United States. The statement was made that from certain coals it is now possible to secure nearly 20 gallons of gasoline or motor fuel of the same value per ton of coal mined. Among other things, a new type of coke, known as semi-coke, has been produced, which it is said has proved a satisfactory fuel for all general purposes. The advantages of using coal in pulverized form or of using briquet, or a new fuel, known as carbocoal, were discussed at some length and in several instances statements were made showing that enormous sums have been spent in order to make these substitutes for coal available to the domestic and industrial consumer during the coming winter.

To-day motion pictures were shown before the engineers in regard to concrete ships, pointing out the important part which ships are playing in the life of the world; the paramount importance of cripples in the manufacturing industries, indicating the wide uses that can be made of them in the mine world; and the Triplex Steel Process.

At the Institute of Metals Division of the Mining Engineers Institute the following subjects were presented in the course of the day: "Conservation of Tin"; "The Volatility of the Constituents of Brass," by John Johnston; "The Effect of Impurities on the Hardness of Cast Zinc or Spelter," by G. C. Stone; "Dental Alloys"; "Electrolytic Zinc," by C. A. Hansen; with discussion by J. L. McK. Yardley; "The Condensation of Zinc from its Vapor," by C. H. Fulton; "The Action of Reducing Gases on Copper," by Norman B. Pilling.

At the Iron and Steel Section meeting the following subjects were presented: "The By-product Coke Oven and its Products," by W. H. Blauvelt, with discussion by A. K. McCosh; "The Use of Coal in Pulverized Form," by H. R. Collins; "Carbocoal," by C. T. Malcolmson, with discussion by W. Rowland Cox, J. M. Fitzgerald, Newell W. Roberts, F. R. Wadleigh, Charles Catlett and Charles M. Barnett; "Low-temperature Distillation of Illinois and Indiana Coals," by G. W. Traer; "Price Fixing of Bituminous Coal by the U. S. Fuel Administration," by Cyrus Garnsey, R. V. Norris and J. H. Allport.

A substitute for radium, the world supply of which is only about three ounces of radium element, has been found, according to a statement presented by Dr. Richard B. Moore, of the U. S. Bureau of Mines. Mesothorium is the radium substitute which, according to Dr. Moore, is excellent in many ways. This can be used, it is said, just as efficiently for radium as luminous paint and it is this use to which radium is being especially put in the work on airplane dials, compasses and gun-sights. In these uses it has greatly increased the efficiency of night firing both with machine guns and artillery. The substitute can also be used for cancer treatment, although

the fact that it has a shorter life makes it much less desirable for this purpose.

Its usefulness in luminous paint will continue for four or five years, which is as long as it is required for cheap watches, push buttons, etc., and which will prevent the use of radium for such purposes, as in some instances it is now being used in wasteful fashion.

The result of Dr. Moore's experiments met with great interest on the part of the mining engineers and excited considerable discussion.

The future peace of Europe depends upon the disposal of the iron ore resources of Alsace-Lorraine. This is an opinion which was reflected in a study of the iron ore resources of the world, made by the Iron and Steel Section.

Although, it is pointed out, enormous resources of iron ore will be available to the world when shipping facilities are adjusted, probably no working basis can be reached to meet the iron ore needs of Southern Europe unless the mines of Alsace-Lorraine are left in the hands of the Allies. In the same session it was stated that the iron ores of Brazil are certain after the war to play an important part in the economic reconstruction of Europe and perhaps in the development of America. It was stated to the engineers that by efficient management these ores could be landed in Europe or the United States at a profit despite a contrary opinion which has been widely circulated.

The meeting is being held in conjunction with the American Foundrymen's Association and the American Malleable Castings Association and engineers are present from practically every metal producing centre in the country. In Machinery Hall a notable exhibit of metallurgical and mechanical processes and products was displayed at which over 165 firms are represented.

Among subjects taken up by the Institute of Metals Division of the American Institute of Mining Engineers were: "The Metallography of Tungsten," by Zay Jeffries, with discussion by Sir Robert Hadfield; "The Constitution of Tin Bronzes," by S. L. Hoyt; "Oxygen and Sulphur in the Melting of Copper Cathodes," by S. Skowronski; "The Relation of Sulphur to the Overpoling of Copper," by S. Skowronski, with discussion by Phillip L. Gill.

The subjects presented by the Iron and Steel Section of the Institute were as follows: "The Work of the National Research Council," by H. M. Howe; "The Limonite Deposits of Mayaguez Mesa, Porto Rico," by C. R. Fettke and Bela Hubbard; "The Manufacture of Ferro-alloys in the Electric Furnace," by R. M. Keeney; "The Manufacture of Silica Brick," by H. LeChatelier and B. Bogitch; "Notes on Certain Iron-ore Resources of the World"; "Recent Geologic Development on the Mesabi Iron Range, Minn." Discussion by Anson A. Betts and J. F. Wolff.

Henry E. Cooper, Vice-President of the Equitable Trust Co., in an interesting treatise entitled, "The Gold Situation," declares that of the many financial and economic problems which the international developments of the last four years have brought to the fore, one of the gravest is the maintenance of the gold reserve.

It is understood arrangements have been made for the resumption of mining operations on the Huronia mine at Beaverhouse Lake, in the Larder Lake District. A number of men have already been engaged.

During the week ended October 4th, eight Cobalt companies shipped an aggregate of 13 cars containing approximately 912,802 pounds of ore. The McKinley-Darragh with three cars containing 211,609 pounds was the leader. A feature of the weekly statement is the appearance of the Peterson Lake once more on the shipping list.

NEWS FROM BRITISH COLUMBIA

NEW REGULATIONS FOR COAL DISTRIBUTION

Fuel Controllers and coal mine operators have received notice from Ottawa, that regulations providing for the more uniform distribution of coal needed for industrial uses in Canada have just been approved by the Governor-in-Council at the instance of the Canadian Fuel Controller.

They provide that all mine operators in Canada and importers of industrial coal in this country shall rotate delivery of coal among their customers in proportion to their requirement so that no one shall at any time have advance supplies on hand while others are under-supplied.

A preference list of coal consumers is also outlined in the regulations. Those preferred consumers include railways, military and government buildings, public utilities, retail dealers and manufacturing plants chiefly engaged on war contracts. These must be given preference in supply over all other users in the order named.

Drastic provision also is made against the unnecessary hoarding of coal on the part of industrial users and heavy penalties are provided. Those whose operations required large advance stocks at the end of the present coal year must obtain special permission from the fuel administrator. Provision is made whereby mine operators and importers may require certified statements from their customers, as to the tonnage of coal on hand and required for each month, so that an equal distribution may be made of all coal mined and received in Canada.

PROSPECTING FOR PLATINUM ON TULAMEEN RIVER

Mining and prospecting for platinum on the Tulameen River, British Columbia, is going forward briskly, having been materially stimulated by the interest representatives of the Geological Survey Branch of the Dominion Government are taking in this work. The Church company, of Tacoma, Wn., is extensively developing property on the Tulameen above Bear Creek, having put in a big dam and a flume 200 yards long. A force of twenty men with three large centrifugal pumps is working the bed of the river over a distance of over 700 feet and is reported to be recovering considerable platinum and gold. Several smaller outfits are at work and the Government, having established camps at Slate Creek, is sinking test holes on the bars and benches to determine the value of the ground to bedrock.

HON. MR. BURRELL IN BRITISH COLUMBIA

Hon. Martin Burrell, Minister of Mines in the Dominion Government, is visiting British Columbia. He is going to Nelson first, where he will investigate the question of the production of zinc and lead. Mr. Burrell has announced that while in the West it is his intention to investigate the prospects of increasing the output of platinum, "as British Columbia promises to be the best source of supply."

GASOLINE FROM ALBERTA NATURAL GAS

It is possible that gasoline will be produced in commercial quantities from gas wells in the Province of Alberta, as a result of investigations carried out by Dr. D. B. Dowling, of the Dominion Geological Survey. At one large gas well south of the city of Calgary a plant already is in course of erection for the extraction of gasoline from the gas. While the flow of gas at the wells in question is sufficient to meet any ordinary commercial demand, the city of Calgary is supplied from other wells and, as there is little chance of another franchise being granted, the owners of the former are turning their attention to the production of gasoline. Because of the scarcity of this fuel the Dominion Government is conducting a thorough survey of the natural gas district with a view to increasing Canada's available supply of gasoline.

RE-OPENING DONOHUE MINE

The Donohue Mines Corporation has re-opened its mining property at Stump Lake, Merritt (B.C.) District, mining engineers having given assurance, according to report, that it can be developed into one of the best mines of the interior of the Province. Descriptions given are to the effect that it is traversed by a series of true fissure veins, all of which carry good values in copper, gold, silver and lead, with some zinc. New machinery and equipment is to be installed, including air compressors and drills, additions to the hoisting plant, etc. It is likely that a new concentrator will have to be provided. Mr. John D. Leedy, of Seattle, Wn., will be the new manager.

To encourage residents of the village in growing vegetables and beautifying their home surroundings the Mond Nickel Company has for a number of years offered cash prizes for the best results obtained in this direction. The results have been most gratifying and this year over ninety-nine per cent. of the village lots are producing vegetables.

At the 100-foot level of the Bourkes Mines at Bourke's Siding, drifting has been carried a distance of about forty feet and the present face is said to be in good ore. Some exceptionally rich ore has been taken out of this working and from a small shipment recently made the company got a return in the neighborhood of four hundred and eighty dollars.

Arrangements have been made for the resumption of operations at the property of the Huronia Mining Company, in Gauthier Township, in the Larder Lake District and a number of men have already been engaged. This property has had a somewhat checkered career, since the first gold discoveries were made there several years ago. The property was sold to a company organized for its extensive operation. Later it passed to the Timmins interests of the Hollinger Consolidated Mines who secured a working option during the tenure of which a considerable amount of diamond drilling was done, with only fairly satisfactory results, which led to the option being allowed to expire. Other interests have since made efforts to operate the property, but up until the present time these efforts have never met with a great deal of success. Just what the plans of the present operators are has not yet been announced.

Claims situated in the Townships of Ogden and Mount Joy in the Porcupine District owned by Philadelphia interests known as the American Porcupine Gold Mines are undergoing exploration, a small force of men being engaged in the work.

Gold mining will doubtless be very active next year. The war has naturally seriously hampered gold production. The end of the war will doubtless soon be followed by the greatest activity the gold mining districts have yet seen. Developments in Northern Ontario during the war have been remarkably good and a return to normal conditions, or nearly normal conditions, will result in great increase in production of gold.

The editor of the Mining Institute Bulletin is apparently of the opinion that the Government has not handled coal production and distribution in a very satisfactory way. Many will agree with him. Comparisons with the United States are hardly fair however. We have been at war for four years and the United States has had every opportunity to profit by our mistakes.

A TRIBUTE TO JAMES DOUGLAS

At the Colorado Meeting of the American Institute of Mining Engineers on September the 3rd, a service was held in commemoration of the late Dr. James Douglas. The Canadian Mining Institute was represented officially by Mr. E. P. Mathewson, who delivered the following address:

"In my early youth I knew of no name in science to compare with that of Dr. Douglas. He was associated many years with the late Dr. T. Sterry Hunt, and Dr. Hunt was the immediate cause of my coming to the United States from Canada and entering on my professional career in this country.

"Dr. Douglas was a man of most benevolent disposition, far-seeing in many ways, who, though possessed of much wealth, thought nothing of money; he had not the love of money at all. The only use he had for money was to do good to those who needed it.

"Dr. Douglas was particularly thoughtful of his Canadian fellow countrymen and particularly of those who were engaged in scientific pursuits. The educational institutions of Canada were frequently benefited by his benevolence. McGill University was highly favored by Dr. Douglas, after he learned of the financial difficulties of that institution. McGill, not being granted any aid from the state, and relying upon private benevolence, had outstripped its income in giving what it could of educational advantages to Canadians, and it became necessary at one time to have a campaign for more funds. In this campaign Dr. Douglas responded nobly and was the means of getting the necessary funds to go on with the good work of that University. The University from which he graduated, Queen's University, was also frequently aided by his benefactions. Altogether, the sums given by him during his lifetime to Canadian institutions would be probably up in the millions, but he was so unobtrusive and so retiring in his disposition that he seldom allowed his name to be used in connection with these matters unless it was possible, by using his name, to influence others to similar benevolence. Anywhere in Canada, if you mention the name 'Douglas,' you will find people who will say at once, 'That was a great Canadian, a man we all revered.'

"Dr. Douglas had the broadmindedness to introduce the open door into metallurgy. Prior to his advent into the metallurgical field, the non-ferrous metallurgists in this country, in Canada, and practically all over the world, were absolutely oyster-like toward visitors. No one was admitted who did not have a letter of recommendation from one of the Board of Directors, at least. But Dr. Douglas, early in his career in this country, allowed every one to come to the plant and visit the mines with which he was connected. He welcomed them, and argued that he was getting as much benefit from the visitors as the visitors were getting from him.

"The example of Dr. Douglas was followed by many metallurgists in this country, and to-day we may say that there is hardly a non-ferrous metallurgical establishment in the United States and Canada to which a person, who is honestly seeking information, cannot obtain access. Of course, during war times a few precautions are taken for fear that information might get to the enemy. This, of itself, is enough to make Dr. Douglas called a great man, and to let his name go down to posterity as really the father of open-door metallurgy."—(C. M. I. Bulletin.)

If it is all that is represented a new copper property has been located in the Arrowhead Lake District, near Revelstoke, B.C., which is likely to be heard from. Some samples are said to have been produced assaying \$50 to the ton. The claims are near the water so that the question of transportation is not difficult of solution.

PERSONAL

Mr. H. H. Lavery was in Toronto last week.

Mr. A. Sancton was at the McIntyre mine last week, and has returned to Montreal.

Mr. E. Craig is foreman at the Otisse mine of the Colorado Ontario Development Co., Matachewan area.

Dr. H. C. Cooke visited the Otisse mine last week.

Mr. "Mike" Kennedy is at the O'Brien mine, Cobalt.

Mr. R. E. Hore has returned to Toronto from Northern Ontario.

Mr. H. R. VanWagenen, the new general manager of the Canada Copper Corporation, has arrived in Princeton, B.C., from Denver, Colo., and is taking up his residence at the scene of the company's operations, Copper Mountain. Mr. Oscar Lachmund, the retiring general manager, will spend the winter in Spokane, Wash. The company's headquarters staff presented the latter with a testimonial on the occasion of his departure in the shape of a handsome suitcase.

Mr. A. R. Whitman has given up consulting practice until after the war, being now an instructor in War Topography at Columbia University.

Mr. Arthur L. Day announces a change of address from Geophysical Laboratory, Washington, D.C., to Corning Glass Works, Corning, N.Y.

Mr. Robt. Bryce was in the Gowganda District last week.

Mr. N. H. Newman is in the Matachewan District.

Mr. W. D. Matthews, President of the Consolidated Mining & Smelting Co. of Canada, accompanied by Mr. C. B. Hosmer, a director of the Bank of Montreal and Mr. Walter O. Miller, District Superintendent of the Canadian Pacific Ry., recently visited the Trail, B.C., Smelter. They thoroughly inspected the smelter from the ore bins to the acid plant, including the blast furnaces for copper and lead, the refineries for both, the roasters and the zinc plant.

Dr. F. W. Farrier, representing the Munition Resources Commission of Canada, and Mr. R. Graham, assistant professor of Mineralogy at McGill University, are making a trip into the heart of the Cascade Range, British Columbia, to inspect mica deposits. Wm. Schmock, who is with the party, is the discoverer of the mica in question and, having succeeded in interesting the Dominion Department of Mines in his find, is escorting and guiding the authorized investigators to his claims in order that they may make a report. As is well known mica is much needed for the manufacture of war necessities.

The Eureka Mine.

The Minister of Mines Report for 1917, refers to the Eureka Mine of the Nelson Mining Division (B.C.), as the chief copper shipper of that section and states that certain improvements of equipment were underway which would permit the shipment of 50 tons a day sometime this year. More recent news of this property is to the effect that this work has been completed and that the plant is in shape for the increasing of output to the point predicted. A lease has been taken on the power plant of the Kootenay Gold Mines and an air line 6,000 feet in length constructed. Air drills have been installed, thus doing away with hand drilling and materially facilitating development. Other work done of a preliminary nature includes the repairing of the tramway and wagon road and the timbering of the mine. The Eureka has shipped 5,000 tons of ore, has about 9,000 tons blocked out, and it is considered that the prospects of developing a great tonnage are excellent. The ore averages about \$15 a ton in silver and copper. The Inland Mining Company, with headquarters at Walla Walla, Wash., has taken over this mine from the original Eureka Company.

THE GOLD CONFERENCE AT SPOKANE

The Gold Conference, which was held at Spokane, Wash., on September 5 and 6, was attended by Wm. Fleet Robertson, Provincial Mineralogist, as the representative of the Province of British Columbia. Mr. Robertson states that those present, among whom were deputations from the States of Washington, Oregon, Idaho, and Montana, were agreed that the monetary value of an ounce of gold was so well established at \$20.67, and accepted by all civilized nations as the basis of national and international financial transactions and credits that no change could even be considered, at least at such a time as the present with the world at war. It was, therefore, impossible to raise the selling price of gold, it being the standard of monetary measurement. It was undisputed, Mr. Robertson declares, that the actual cost of producing an ounce of gold from lode mining as compared with pre-war costs had increased from 50 to 75 per cent. It was shown that a large percentage of the gold mines under present conditions could not produce gold at a profit with gold at \$20.67 an ounce and had shut down, while with many others the profits had been reduced to so nearly the vanishing point that the owners had or were about to shut down until operating costs became lower which naturally meant until after the termination of the war. Mr. Robertson pointed out that certain copper properties in the aggregate produced a large quantity of gold, yet in these properties the gold was merely a by-product, only from 5 to 10 per cent. of the total values being gold while the remaining 90 to 95 per cent. was in copper, the value of which latter metal had increased so greatly, that this class of mine at present was making excessive profits and did not need any assistance. He attempted to get a definition of what a "gold mine" was, as none of the British Columbia mines produce gold exclusively. The sense of the meeting, however, was that assistance should be sought for any mine producing gold, in whatever proportion such gold might be to the total values contained in the ores. In summing up the results Mr. Robertson stated that the suggestions of Mr. F. A. Ross, vice-president of the Northwest Mining Association, had been endorsed, emphasis being given that recommending a bounty on gold produced. The suggestions offered by Mr. Ross may be summarized as follows:

(1) The recognition of gold mining as a war industry with special privileges as to taxation, priority in obtaining

supplies, transportation and labor, etc. (2) The immediate induction of labor, as has been done in the case of the lumber industry. (3) The building of trunk line motor truck roads necessary to the building up of commercially inaccessible gold fields, precisely as the spruce forests have been made accessible by Government-built railroads. (4) The extension of financial aid to such properties as may be judged by qualified Government specialists to be capable of producing metals essential to the conduct of the war. (5) The granting of a bounty on all new gold produced by the mines of the United States; and the same to be paid by the Canadian Government on new Canadian gold.

The chief resolutions adopted at the Conference follow:

Memorial to governments of the United States and Canada requesting in aid of the gold mining industry, priority rights; assignment of labor to mines; motor truck roads to commercially inaccessible gold fields; government financial aid to approved properties and bounty upon new gold as determined from time to time by the proper authorities.

Requesting Northwest Mining Association to appoint a committee to continue work of Conference and co-operate with American gold conference.

Endorsing action of Oregon Bankers' Association, which went on record in favor of "appointing by the Secretary of the Interior of a committee to study the increased cost and the decreased output of gold, in order that the gold production of the United States may be maintained at its pre-war volume."

Urging the President of the United States to appoint "a man whose success and experience in mining thoroughly qualifies him for the position" upon the Industrial Commission to be sent to Siberia.

Urging upon Congress that relief from annual assessment work upon mining claims, now covering the years 1917 and 1918, be extended to include the calendar year after the termination of the war.

Urging that, to relieve the labor shortage, men in military training be permitted to work in mines under proper rules for pay and protection and that men slightly disabled be given opportunity to perform such work.

Urging that property owners in adjacent mining districts make reports upon local conditions to committee appointed by Northwest Mining Association for use in furtherance of the objects of the Conference.

Mr. Robertson submitted the following analysis of the lode gold output of British Columbia:

LODE GOLD OUTPUT OF BRITISH COLUMBIA.

SPECIAL CORRESPONDENCE.

BRITISH COLUMBIA.

Ore shipments to the Trail (B.C.) Smelter had reached the total of 239,197 tons early in the month of September.

Roaster Building Destroyed by Fire.

Fire threatened to destroy the entire plant of the Canadian Consolidated Mining & Smelting Co., Trail, B.C., recently but, fortunately, was got under control before advancing too far, with a total monetary loss of only \$40,000. The Dwight and Loyd roaster building and contents were completely destroyed. This structure was one of the oldest of the plant, having been erected with hewn timbers about twenty years ago. It was oil soaked and an easy prey to the flames. The only explanation of the outbreak given is that the oil ceased to flow to the furnaces for a time and then recommenced. Without being noticed with the result that it became ignited by the hot furnaces. The work of rehabilitation is being hastened and will not take long, the destruction of six electric motors, one of 100 h.p., two of 50 h.p., and the others in smaller sizes being the most serious in point of replacement. It is not thought, however, that the work of the lead plant will be held up as there are old roasters which can be used if required. A new wooden building is likely to be constructed for temporary use, a steel structure taking its place as soon as it can be erected.

Asks Removal of Royalty on Gold.

There is a demand among the companies and the placer miners of the Yukon Territory for the removal of the present royalty exacted on the gold output of that section of Canada. Consequently Dr. Alfred Thompson, member of the Dominion Parliament for the Yukon, has announced that at the next Session of the Parliament, he will ask that, as a war measure, the said royalty be removed. He thinks that this can be done easily by introducing an amendment to the Yukon Placer Mining Act. Dr. Thompson asserts that his constituents are not requesting too much in view of the increased cost of mining and the desirability of encouraging the output of gold to assist the Allied Countries in meeting the extraordinary financial obligations caused by the war.

The Increased Charges for Smelting at Trail.

An increase in the charge for smelting to \$8.30 a ton as against \$7.50 is announced by the Canadian Consolidated Mining & Smelting Co. It is contained in a circular issued by General Manager S. G. Blaylock, which is dated August 31, and reads as follows:

"In our circular of July 31, we advised you of an increase in the price of coke amounting to 40 cents a ton and stated we understood that further increases were being made. We now have definite advice of these increases. They are, first, a further increase, effective August 1, ordered by the director of coal operations, in the first cost of coke, amounting to 36 cents a ton, and, second, an increase by the railway commission in freight rates of 65 cents a ton. The total increase therefore since Schedule B was published in the price of coke is \$1.41 a ton. Under the terms of Schedule B we are accordingly increasing the base rate of 25 per cent. of this or 35 cents per ton of ore.

"Our circular of July 31, has already advised you of the increase of 45 cents a ton on account of wage adjustments.

"The total increase of the base rate effective August 1, 1918, is, therefore, 80 cents a ton, making the base rate now \$8.30 a ton instead of \$7.75.

"The freight adjustment in the lead sale price advised in our circular of July 31, is more than covered by the recent advance in freight rates on the competing lead from American points, so that this adjustment is compensated for by the increase in the lead prices in Canada."

Activity in Kootenay District.

That men in the gold mining industry find themselves in an unenviable position by reason of high costs of production, and the stationary price of gold is a statement made by Mr. Fred. A. Starkey, President of the Associated Boards of Trade of Eastern British Columbia, after a recent tour of the Province. He expressed the opinion that the government eventually would have to relieve the condition by bounty or premium of some sort if gold production is to continue. Mr. Starkey states that, with the exception of gold mining, never in his experience has he found the mining industry of the Kootenay District of British Columbia more prosperous.

"Since the outbreak of the war," he said, "the silver-lead properties of the Slocan District have been reopened and without exception are doing splendidly. Properties which had been closed down and which it was not expected would operate for a long time if ever are producing more metal than ever before. Mr. Clarence Cunningham, who has been operating in the Slocan for a comparatively short time, is now building a concentrator at Three Forks, B.C., to serve the properties on the Sandon, B.C., side of the range. He first obtained the Queen Bess which with little work was made a consistent producer and he also now controls the Sovereign, Wonderful, Van Roi, Alamo-Idaho, and Wakefield, all of which are producing silver and lead. The Van Roi and Hewitt have their own mills, and the new one will serve the other properties. The plant is to cost about \$150,000.

"The Rosebury-Surprise Company at Sandon, has just taken over the Ivanhoe and the Canadian, which are old mines. The Slocan Star is another fine property and work is being continued on a nine-foot vein in the old workings under the management of Mr. R. H. Stewart. Some first-class ore is being taken out.

"Mr. C. F. Coldwell is working on the old Utica which is shipping again. I understand that the Cork-Province is working full blast and development in this section is greater than ever before.

"Coming into East Kootenay the Sullivan Mine, owned by the Canadian Consolidated Mining & Smelting Co., is the biggest shipper. Another big producer is the Paradise at Wilmer, B.C. The old North Star and other properties were acquired recently by the Federal Mining Company of the United States.

"A most encouraging feature of this year's operations is the fact that many leases have been taken throughout the District, and this means much valuable development. Some 1,500 miners are employed in the District."

Inquire Into Smelter Charges

There is every indication that the inquiry into the schedule of charges and the general policy of the Consolidated Mining & Smelting Co. of Canada, towards the operators of British Columbia will commence at an early date. Messrs. Fowler, DeLashmut and Anderson, three prominent mining men of British Columbia, who were nominated by the Associated Boards of Trade as being the proper persons to conduct such an investigation, have decided to accept their appointment at the hands of the Dominion Government, the latter, apparently, having met their wishes in regard to empowering them to take evidence on oath and also as to providing the finances necessary to enable them to make their work thorough and complete.

Are All Coal Miners Doing Their Duty?

Coal mine operators of British Columbia have complained for some time of the tendency which they allege exists among their men of laying off at frequent intervals to enjoy a holiday notwithstanding the former's efforts to meet the urgent need for fuel by increasing the output of their mines. They assert that many of the men, all of whom now are receiving much higher wages than are available under normal conditions, take advantage of

their improved financial position to work little more than is necessary to obtain a good living remuneration.

In this connection Mr. T. A. Spruston, Superintendent of the Canadian Collieries (Dunsmuir) Ltd., has received the following communication from Mr. N. Thompson, Fuel Controller for British Columbia:

Dear Mr. Spruston:

I have to thank you for your favor of September 9, enclosing statement showing the percentage of shifts lost from the 3rd to the 7th.

I regret to see that the percentage has gone up for the time mentioned without considering the holiday of September 2, and I think it is a pity our men here cannot see the importance of working as near as possible full time and keeping the production of coal up to as near as possible the top notch.

Just recently I received a file of letters from the Fuel Administration of Washington, setting forth the extra effort that is being made by the miners in the United States since they entered into the war. I enclose herewith copies of some of the memos which I received, and it is my intention to send similar copies to the secretaries of the men's committees of the various mines in British Columbia, and I trust it may have the effect of impressing upon them the importance of their responsibility in the present crisis of our country's history.

Yours faithfully,

(Sgd.) N. THOMPSON.

Fuel Administrator for British Columbia.

The memoranda in question shows that the United States Fuel Administration has found that since coal production records began to be broken in various of the leading districts, the spirit of emulation seems to be catching throughout the entire production field. In nearly every field the mine workers are a unit in consenting to make a sacrifice of many of their usual holidays and diversions. Wherever there seems to be a danger of taking men away from the vital task of mining more coal the mine workers are doing their part by making the necessary sacrifice.

One special incident given is at Barnesboro, Pa., the centre of an important mining district, where one of the annual events enjoyed by the mine workers has been the picnic of the Northern Cambria Scottish Club. It is pointed out that word has been received by Mr. Jas. B. Neale, Director of Production, U.S. Fuel Administration, that the Northern Cambria Club has decided to discontinue its annual picnic during the period of the war so as not to interfere in any way with coal production.

It is further explained for the benefit of the Western Canadian miners that the U. S. Fuel Administration has taken the position that in producing fields wherever public gatherings, county fairs, firemen's picnics and such like, are likely to interfere with production it is desirable that they be abandoned while the present National need of fuel continues.

Coal Production.

British Columbia's production of coal for the month of August totalled 240,055 tons, which is an increase of 13,467 over July, and the highest tonnage produced in any month so far this year. Vancouver Island takes the lead in comparison with the output of other Provincial Collieries having 145,266 tons to its credit. The Crow's Nest Pass mines are next with 78,971 tons while the Nicola Princeton District shipped 15,818 tons.

Of the Island companies the Canadian Collieries Ltd., have the best showing with 71,791 tons, the Canadian Western Fuel Company following close with 61,200 tons. The balance is accounted for by the smaller collieries as follows: Pacific Coast Coal Mines, South Wellington, 6,858 tons; Nanoose Collieries, 2,631 tons; Granby Consolidated Mining & Smelting Co. (Cassidy's), 2,383 tons; B.C. Coal Co. (Jingle Pot), 400 tons.

In the Crow's Nest Pass District the Crow's Nest Pass Coal Co., produced 66,457 tons from the two collieries operated, as follows: Coal Creek Colliery, 44,366 tons; Michel Colliery, 22,091 tons; Corbin Coal & Coke Co., 12,514 tons.

The Middlesboro Collieries were the biggest producers in the Nicola Princeton District with a tonnage of 8,529, the remainder coming from the smaller collieries.

The new mines being opened on the Island are beginning to count in the monthly production, these recently opened up at South Wellington and Cassidy's having an output of 5,530 tons for the month, while it also is to be noted that the Jingle Pot, for months sealed by order of the Chief Inspector of Mines, because of fire, is again on the shipping list. But the most remarkable gain is that of the Harewood Mine of the Canadian Western Fuel Company which was recently re-opened and last month produced 21,695 tons.

At the other new mine, which is being opened by the Canadian Western Fuel Company on the farm near Nanaimo, rapid advances are being made. Two shafts are being sunk to tap the Wellington Seam, and one of these struck the coal a few days ago, exposing a seam about 9 feet in thickness. The other is expected to reach the same seam sometime during the present month.

The total production of the coal mines of British Columbia so far this year is 1,822,031 tons. For the same period last year it was 1,535,998 tons. Therefore there has been a gain of 286,033 tons.

WILL OPERATE SILVER BELL MINE.

Considerable activity is reported at the Silver Bell mine, a high grade silver-lead property situated on the South Fork of Kaslo Creek, B.C., and owned by Mr. R. F. Green, M.P., and Mr. S. Green. Quantities of equipment and supplies are being shipped in and it is understood that operations are to be carried on well into the winter. This property has been idle for fifteen years.

EXODUS OF GOLD MINERS FROM YUKON AND ALASKA

The stationary price of gold and the much increased cost of mining material, food and supplies has caused a sudden exodus of miners and their families from the Yukon and Alaska. Every boat coming down the coast from Ruby, Fairbanks, Iditarod and Dawson comes with all accommodation taken by people who are leaving the country for the coast, where there is hope of getting work in shipyards and other war industries at high wages until after the war. This "stampede," for it is said no other term fittingly described the condition, has caused a decided slump in the gold output, as evidenced by figures tabulated by the banks, express companies and others. The decline in the Alaskan camps is said to be fully 50 per cent., according to figures given out by various institutions having to do with the handling of bullion. The Yukon and Alaskan Press is unanimous in declaring that unless a bonus is provided or other adequate measures taken the gold camps of the North will be paralyzed until normal conditions are restored. Arrivals at Dawson express doubt as to whether all those who want to get out of the country this winter will be able to do so. There is an agitation to request the Government to send extra boats to help those having difficulty in getting out of the district. The overland stages are crowded.

Mr. Hugh Boyle, of the Dominion Diamond Drill Co., has gone to Weyburn, Sask., to superintend some extensive diamond drilling work in the coal fields there.

Granby, Oct. 8.—At first glance the report of the Granby Consolidated Mining Company for the year ended June 30th last, presents a rather lean showing. Granby, however, like most mining companies, increased its chargeoffs last year, pulling net down to but a few cents above the annual dividends of \$10 a share.

On a production of 44,675,000 pounds of copper and 550,000 ounces of silver the company earned a gross operating profit of \$4,124,819. After bond interest of \$582,195, net profits were \$3,542,624, or the equivalent before depreciation of \$23.60 a share on the 150,000 shares.

But Granby reserved for depreciation \$2,015,491, 60 per cent. more than the \$1,256,267 set aside in the preceding twelve month, a sum that would seem to be ultra-conservative. After this reservation there remained a balance of \$1,527,133. The year's dividend called for \$1,500,000, leaving a surplus of but \$27,133.

With \$2,015,000 charged against earnings for depreciation stockholders need have nothing to worry about, for Granby can easily earn and pay \$10 a share with copper at or near 26 cents a pound.

"Mine exhaustion" has caused a writing down of value of mining property to \$9,100,000 from \$15,000,000 at which it had stood for a number of years.

Ore reserves on June 30th were placed at 23,531,208 tons, estimated contents being 688,064,015 pounds of copper, 265,157 ounces of gold, and 2,238,193 ounces of silver. This tonnage includes 10,000,000 of low-grade material which the company hopes to handle by flotation.

NORTHERN ONTARIO

Hollinger-Consolidated Mining Company.

Operating their milling plant at a little more than half capacity, the Hollinger-Consolidated Mining Company at Porcupine is yielding well over \$500,000 in gold per month. Recently the directors of the company visited the property, and on their return to Montreal expressed themselves as "more than ever impressed with the greatness of the mine." It was also stated to be the intention of the directors to keep the mine in continuous operation as long as the supply of labor will permit. At the present time the supply of workmen is far from satisfactory and efficiency is sadly lacking, but in spite of this fact the production of the company remains high. With a sufficient number of men available the present equipment of the Hollinger-Consolidated could be speeded up to from 3,000 to 3,500 tons daily, compared with less than half that amount being treated at the present time. owing to the fact that the winter months usually see an increase in the number of men at the various properties, seeking employment removed from contact with nature's elements encountered in outside work, the next six months' operation of the property may reasonably be attended with great prosperity. Added strength is given to this contention when it is remembered that the Canadian Government may follow the example of aiding the gold mining industry by placing miners in preferred classes in respect to the need of men for military drafts, and it is highly probable that special concessions will be given to these concerns in the matter of taxation. It is understood that the Hollinger, due to having increased its average mill heads, is making net profits considerably in excess of dividend requirements of 1 per cent. every eight weeks, or $6\frac{1}{2}$ per cent. per annum, the policy of the directors being to further add to the already big surplus. The dividends at $6\frac{1}{2}$ per cent. are on a parity with the returns of first-class bonds; with the added inducement that with the conclusion of the war and adequate working forces, the company will be able to pay 13 per cent. or even more. The company own a large area of ground which up until the present time has been proven to contain upwards of two score veins, none of which have been explored, while

depth of 1,200 feet upwards of \$40,000,000 in ore reserves was shown in the last annual report of the company. To use the words of one of the directors who recently visited the property: "The Hollinger has only started to mine."

A limited amount of development work is being done at the Dome Mines, Porcupine, and about sixty men are employed at the property. It is understood a contract for driving a raise from the 800-foot to the 700-foot level was recently let. Heretofore the main workings of the Dome have been between the 700-foot level and the surface, where, according to the last annual report of the company, close to \$10,000,000 in gold ore was blocked out. The present plan would appear to be to add the 800-foot level to the main workings of the property. With exploration work having been carried to a depth of 1,250-feet, where considerable lateral work was done, it appears reasonable to expect that the various levels down to that depth will be developed in their turn as fast as labor conditions will permit. With a return to normal conditions the Dome Mines should be one of the first and foremost properties in the Porcupine camp to reflect the improved conditions.

Very satisfactory results are obtaining in a winze driven from the 1,000-foot level of the McIntyre-Porcupine Mines. It will be remembered that upwards of a year ago diamond drilling disclosed the presence of an ore body at a depth of 1,400-feet, which proved to be the downward continuation of the main ore body of the mine. The policy of development being followed by the McIntyre is to establish main haulage levels at depths of 300-feet with intermediate level at depths of 150-feet. Thus the 1,300-foot level will become a main haulage way with an intermediate working at the 150-foot level. This will permit of the automatic handling of ore from the stopes of the mine to chutes where it will be possible to load the cars with the minimum amount of labor. The production at this, the second largest producer in the Dominion of Canada, is at the rate of upwards of \$150,000 per month. The mine is now developed to a position where added milling facilities are required and with a cessation of hostilities in Europe and a sufficient supply of men, it is understood the company would immediately undertake the construction of an addition to the mill which would raise the present capacity of 600-tons per day to 1,000-tons. The average gold content in the ore of the mine, as so far determined appears to be close to \$11 per ton. In the past it has been the policy of the management to treat the ore from development work without bringing it up to the average of the mine. This policy has resulted in placing the ore reserves in excellent condition. The annual meeting of the company has been called for the 26th of the present month and besides the general business of the organization, the shareholders will vote on the proposed purchase of the Plenaureum property. The forthcoming annual report will cover the period of operations for the fiscal year of the company ending on June 30th last, and is expected to show the affairs of the company to be in an exceptionally satisfactory condition.

The new shaft being sunk at the Davidson property is down nearly 400-feet, this shaft is being sunk some distance north of the original shaft. The object in view in sinking this shaft is to open up an ore body which has been cut by diamond drilling at depths of 650 and 550-feet. The core of the first drill hole showed a vein 30 feet in width of ore containing good average milling values, while the second hole disclosed the ore body a similar width with slightly increased value a hundred feet lower down. The shaft is being sunk at the rate of about five feet per day and should encounter the new ore body within

tensive ore body has been opened up down to the 300-foot level, ore from these workings having been treated in the mill since the commencement of milling operations.

Mr. P. A. Robbins, managing director of the Hollinger-Consolidated Gold Mines, has joined the forces of the American Engineers for overseas service, and left recently for California, where his family will reside until his return from overseas. Mr. Robbins was general manager of the Hollinger all through its early development, and indeed, up until seven months ago, at which time he became managing director, to be succeeded by Mr. Brigham as general manager. To the former general manager is due in a large measure the present satisfactory condition of the Hollinger-Consolidated. Besides his extensive mining activities, Mr. Robbins found much time to devote to municipal affairs in the town of Timmins and will be greatly missed in this respect as well as by Northern Ontario mining men generally.

A carload of concentrates resulting from the operation of the new Peterson Lake Mill was among the list of shipments from the Cobalt camp for the past week, the material going to the Globe smelter at Denver, Colorado. Mr. C. A. Filteau, manager of the National Mines, was appointed manager of the Peterson Lake Silver Mining Company at a meeting of the directors held on the 14th of September. Mr. Filteau will also continue to manage the National property. Both these properties are equipped with small oil flotation plants, and are treating tailings from previous operations.

The annual meeting of the shareholders of the McIntyre Porcupine Mines, Limited, will be held in the Board Room of the Bank of Hamilton, 65 Yonge Street, Toronto, on Saturday, the 26th of October, 1918, at eleven o'clock in the forenoon for the purpose of receiving the report of the operations for the year ended June 30th, 1918; for the election of directors for the ensuing year, and the transaction of such other business as may properly come before an annual general meeting of shareholders and for the following special business: To consider and, if approved, to ratify and confirm a by-law of the company authorizing it to purchase the whole or any portion of the capital stock of the Plenaureum Gold Mines, Limited, for cash or fully paid stock, and to use the funds of the company therefor.

The installation of machinery at the Haileybury Mining School is nearing completion. The building itself was completed some time ago. The structure is of solid brick. The ground floor is almost wholly taken up with a complete mill of the most modern design. In addition to serving educational purposes, the mill is expected to be useful in determining the process best suited to the treatment of the various ores met with throughout this mining district. The equipment consists of a small jaw crusher, three light stamps, amalgamation plate, classifiers, 3 x 4 tube mill, concentrating tables, the usual agitators and thickeners. Flotation equipment has also been installed. Therefore it will be possible to test ores for determining either their free-milling qualities, their adaptability to cyanidation, or treatment by flotation.

The record from the Coniagas Mine at Cobalt for the current year promises to be on a par with that of last year, production being at the rate of upwards of one million ounces of silver annually. According to the last annual report the company had approximately five million ounces of silver in their ore reserves. Last year the price of silver averaged 81.47 cents per ounce, while for the first half of the current year the price of the white metal has averaged 92.8 cents per ounce. Owing to arrangements between the governments of Great Britain and the

United States in which the price was fixed at \$1.01½ cents per ounce, the average price for the full calendar year will be 96.805 cents per ounce. This is more than 15 cents per ounce over the average price for the preceding year. The increased net earnings for the various large silver producers is readily realized.

This week in the crosscut being driven west at the 310-foot level of the Adanac Silver Mine, which adjoins the Temiskaming, ore was encountered. The new vein is upwards of six inches in width and is composed of calcite, cobalt and niccolite, as well as considerable native silver. This vein was encountered approximately twenty-one feet west of the first stringer cut in this cross-cut, which marked the eastern side of a series of veins, which bid fair to develop into a big asset for the Adanac Company. For the full twenty-four feet the cross-cut has opened up a series of veins, ranging in width from mere stringers to as much as nine inches, the last few veins encountered being the strongest and most uniform of the series. When the entire shear zone has been cross-cut the management will commence drifting on the most encouraging vein, and the results are looked forward to with the keenest interest. With such a series of veins occurring in the Keewatin formation in the zone immediately above the diabase and in close proximity to one of the most pronounced shearings in the mine, the outlook never appeared so bright for the Adanac. The geological conditions being met with are proving true to those predicted by Mr. A. R. Whitman, well-known geologist, and the conditions are almost identical with those prevailing on the Temiskaming mine in its most productive areas. The Adanac will be the centre of interest in the Cobalt camp until the importance of the new discoveries is determined.

Active underground operation of the Foster mine at Cobalt has commenced, the property being under lease to Messrs. C. L. Campbell, of Montreal, and Mr. W. Fairburn, the latter being in charge of the work at the mine. A small railway siding has been constructed from the Nipissing Central Railway to the property and the dumps from previous operations are being transported to the Northern Customs mill at 104 for treatment. Already upwards of ten cars have been shipped, the ore for the greater part being of low grade, running approximately ten ounces to the ton. With the cost of mining eliminated this allows of a good margin of profit with silver selling above the dollar mark. A considerable amount of high grade ore is also being encountered in the work of loading the ore. This is being sorted out and bagged and a considerable amount running close to 2,000 ounces to the ton has already been found. It is estimated that the entire dumps contain about 13,000 tons. The mining operations underground, for the time being, will be confined to the upper levels owing to the fact that the lower levels of the property are flooded with water and considerable delay will follow before the de-watering can be accomplished. The agreement on which the lease has been given to the present operators calls for ten per cent. of the profits to go to the Foster Mining Company. Facilities for handling the ore from the mine and dump are being improved and it is expected that in the near future about one car of ore per day containing upwards of fifty tons will be sent to the mill for treatment.

Developments at the Beaver Consolidated property at Cobalt in the zone immediately above the diabase are understood to be very favorable. At the same time the new mill on the company's Kirkland Lake property, the Kirkland Lake Gold, is nearing completion, with the resultant possibility of adding largely to their revenue from the treatment of the large amount of good grade ore

already mined and on the dumps at this property ready for treatment in the new mill, as well as the workings of the property having reached the most advanced depth in the Kirkland Lake camp (700-feet) at which point the vein was proven to contain consistent width and value over some 20-feet. A new main shaft is being sunk as a central working for the property and is being connected with the old underground workings as each succeeding level is reached. It might be said that the Beaver Consolidated is in a very strong physical position.

Development work at the Keeley mine is being carried on in a small way, a few men being employed by the company and considering the size of the working force a considerable amount of ore is being recovered. Owing to the fact that the personnel of the company is made up of Old Countrymen, it is not thought likely the property will be very aggressively operated until the conclusion of hostilities in Europe.

The legal action involving the interlocking directorates of the R. A. P. Syndicate property and that of the Boston Creek Gold Mines is reported to have been settled out of court. It is further learned from a reliable source that negotiations aiming at the amalgamation of the two properties are now in a more or less advanced stage. The rumors to the effect that operations would be resumed in the near future appear to be well founded. The R. A. P. property is equipped with a modern mining plant while the Boston Creek Gold mines have buildings sufficiently large to accommodate an adequate working force. Prior to the development of differences between the principals of the companies, the R. A. P. Syndicate shaft had been driven to a depth of 200-feet, at which point lateral work was carried on to the property of the Boston Creek Mines, on which a winze was driven to a depth of 300-feet. With a merger of the two properties effected their development could be carried forward without much delay. News to this effect will cause general satisfaction in the Boston Creek camp and at the same time extend the field of active operations.

Conserve Steel and Iron -Cut Out the Scrap Pile

Prest-O-Lite PROCESS

Analyze Your Scrap Pile

YOU'LL probably find conditions such as our research men are finding in many industries—months' supplies of valuable materials easily available for use by oxy-acetylene welding.

Get a list of the broken and worn parts in your scrap pile today. Let us tell you where welding by the Prest-O-Lite Process will enable you to take certain discarded parts out of scrap and reclaim them at a trifling cost.

The Prest-O-Lite Process is ideal for all classes of metal repair work. It handles repairs quickly and efficiently,—often right on-the-spot—makes the broken or worn part strong as new—saves time which would be wasted waiting for replacements—avoids the "scrapping" of valuable metal parts.

The welding outfit is portable—available at all times for outside work as well as for shop use.

In mining, as well as in manufacturing, the Prest-O-Lite Process of Oxy-Acetylene welding is effecting important economies.

No matter what other welding method you now use, a Prest-O-Lite outfit put to work in your shops will speedily pay you profits. Write for special literature and data—now. Address Dept. C—108.

OPPORTUNITIES

--for--

Prospectors and Mining Companies

The mineral wealth of Northern Ontario is enormous. From a few developed areas a very large output of nickel, copper, silver and gold is being made. Many promising areas are awaiting the prospector and miner.

Recently Northern Manitoba has become an important producer of copper ore, and many promising gold deposits have been located. This is an excellent field for the prospector.

One of the greatest factors in development of mineral areas is the provision of transportation facilities. Railways and the mining industry have together played a very important part in the development of several parts of Canada.

The Canadian Northern Railway, recently constructed across Northern and Western Ontario, has opened up for prospecting a large territory. Easy access to many promising areas is now available. Geological maps of some of these areas can be obtained from the Geological Survey, Ottawa.

The Canadian Northern Railway in Manitoba gives access to the Pas Mineral Area. In Alberta the Canadian Northern is serving important coal fields.

THE DEPARTMENT OF RESOURCES CANADIAN NORTHERN RAILWAY

The Department of Resources, Canadian Northern Railway Building, Toronto, will be pleased to furnish information about the districts served.

Dr. Charles F. Mabery said, in the *Journal of Industrial and Engineering Chemistry*:

"In the general plan and scope of this work it seems difficult to suggest an improvement. The evident care in its preparation, the statements supported by numerous citations from petroleum literature, and the cooperation of practical experts, are the best assurance of its accuracy."

American Petroleum Industry

The first comprehensive and authoritative treatment of the American petroleum industry. The books are distinctly modern in every respect. They cover the chemistry, geology, technology, history and economics of the subject thoroughly. They place at the disposal of engineers, chemists, and students a complete summary of present-day knowledge and practice of the American petroleum industry.

The Mineral Springs of Canada. Part II., by R. T. Elworthy, B.Sc.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

Communications should be addressed to The Director, Geological Survey, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

THE recent decision in the Butte & Superior Suit with Minerals Separation has an important bearing upon the use of the Pneumatic, or Callow method of flotation.

The Appellate Court's decision at Philadelphia, in the Miami case, had already made clear the distinction between (1) froth produced by violent mechanical agitation of the Minerals Separation process, and (2) simple levitation by air bubbles, as practised in the Callow or pneumatic cell, without such agitation.

Now the Appellate Court at San Francisco has interpreted the United States Supreme Court's opinion in the Hyde case, whereby the Minerals Separation Patent was restricted to the use of a minimum, or 'critical' proportion of oil, in combination with violent mechanical agitation.

This latest decision of the Appellate Court in the Butte & Superior case, restricts the Minerals Separation basic patent to the use of a quantity of oil *not in excess of ten pounds (0.5%) per ton of ore, in combination with violent agitation*: it is a logical sequel to the Supreme Court's opinion and confirms the status of the Callow or Pneumatic method of flotation as distinct from the agitation-froth process.

Both the use (1) of oil in excess of ten pounds (0.5%) in combination with violent agitation, and (2) the use of the Callow system of aeration with any quantity of oil, appear therefore to be immune from any charge of infringement.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.

Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,

Per C. F. BUSS, Superintendent.

MINING MACHINERY FOR SALE

By Gibbes' Limited, 101 Water St., Vancouver, B.C.

1 pr. Direct-acting Hoisting Engines 22 x 42, built by the Wm. Hamilton Manufacturing Co., Ltd., Peterboro, Ont. Condition: almost new, only used 4 months.

1 large Clyde Boiler 72 in. for 125 lbs. working pressure, developing 150 H.P., complete with feed water pump, stack and fittings. Condition: excellent—has only been fired for 12 months.

1 Ideal Electric-light Engine, suitable for driving a dynamo carrying about 600 lights.

1 Coal Tipple, including conveyor equipment and screening apparatus.

1 large revolving screen,

1 large shaker screen,

50 ft. of picking table,

necessary drives, gears, pulleys, shaft, etc.

The above Tipple is built of heavy timbers bolted together, and can be easily taken down and re-erected.

RAILS

New or Relaying

12 to 80 pound per yard

Locomotives,

Switches, Turntables,

Dump Cars,

Portable Track, Etc.

JNO. J. GARTSHORE

58 Front St. West - Toronto, Ont.

TANKS For Immediate Shipment

1—Open top steel Tank, suitable for fuel oil, 16 ft. dia., 16 ft. high, cap. 24000 gals., $\frac{7}{16}$ in. plate, double rivetted, angles top and bottom. First class.

1—Horizontal closed Tank, 4 ft. dia., 7 ft. long, 2-dished heads, $\frac{1}{4}$ in. plate, 18 in. manhole, cap. 600 gals. Good as new.

1—Horizontal pressure Tank, 6 ft. dia., 15 ft. long, flat heads, $\frac{1}{2}$ in. plate, manhole, cap. 3200 gals. Guaranteed equal to new.

1—Horizontal pressure Tank, 9 ft. dia., 20 ft. long, flat heads, $\frac{9}{16}$ in. plate, triple rivetted, cap. 9500 gallons. Splendid condition.

1—Dakin feed water Heater, No. 3 complete with pumps and fittings, 300 HP.

We have a fully equipped Plate Shop;
Send us your enquiries.

“HISCO” means **QUALITY**

ARE you using “HISCO” Products? If not, why not? We SPECIALIZE in mining machinery parts. Mill linings, balls, stamp shoes, dies, crushing plates and all parts where extraordinary wear is required our special “Chromnic” steel will stand the test. It is being used in mining operations from coast to coast and giving entire satisfaction.

“CHROMNIC” costs less and wears longer.

Why not give “Chromnic” a trial? Once used always used. Prompt delivery assured.

Canadian Representatives :—Hardinge Conical Mill Co.

for developing your New Colliery— —alternating current “Ironclads”

Don't wait for a power plant.

Hook a transformer to the nearest transmission line, wire your entries as they advance and start production at once, with one or two **Sullivan “A.C.” Ironclad Mining Machines**. They are fast and handy for entries and narrow work.

When your direct current plant is in, save it for haulage, and keep on cutting coal with **AC Ironclads**. This method will obviate low voltage at the machines, which often results when the same feed wires are used to supply both cutters and locomotives.

AC Ironclads use squirrel cage induction motors, 3-phase, 30 H.P., with star-delta control. Simplicity, low magnetic leakage and a high pulling-out torque are advantages that mean power and repair economy and cutting efficiency.

Where difficult cutting is encountered **AC Ironclads** will get out the tonnage, when other types stall and stop working. **AC Ironclads** are built for room and pillar and for longwall mining. They will cut in either direction, can be equipped with cutter bars up to 10 feet (for room mining) and possess all other mechanical advantages of the direct current Ironclads.

A Victory Loan Message to the Mining Manager

DO not forget that it is not enough to buy Victory Bonds for yourself. Run a little advertising campaign of your own; encourage, argue, persuade. Tell your men how the Victory Loan helps the boys "over there," appeal to the savings instinct.

Work for the Loan---800,000 Canadians bought the last Victory Loan, help to make it a million this time.

“New Cleveland”

The Drill that gives Super-Service

Owners of the “New Cleveland”—and there are hundreds of them in the different mining centres of Canada—do not know what drill trouble means. From the beginning to the end of the season they stay on the job **continually**, as their solid construction requires no repairs.

They use less air and operate more smoothly than other drills, and the speed and power of the blow enables the runner to break previous records.

This means increased output at a lower cost of production, and with less labor required—a vital consideration these war times.

Use a “New Cleveland” on your job this season and put the “pleasure punch” in your work.

Write for Bulletin No. 35-A, which fully describes the “New Cleveland” Type S Stoper.

If It Only— --Saves Carbide

Supposing an ITP only reduced
your Carbide bills 20%.

THAT'S WORTH CONSIDERING

Add to this the increased production due to the brighter, steadier light—then consider the time lost tinkering, regulating and adjusting other lamps—and finally remember the ITP burns 9½ hours on one charge. All of this means that an ITP is charged and lighted when a man goes to work—after that nothing more until the shift is finished.

OPPORTUNITIES

--for--

Prospectors and Mining Companies

The mineral wealth of Northern Ontario is enormous. From a few developed areas a very large output of nickel, copper, silver and gold is being made. Many promising areas are awaiting the prospector and miner.

Recently Northern Manitoba has become an important producer of copper ore, and many promising gold deposits have been located. This is an excellent field for the prospector.

One of the greatest factors in development of mineral areas is the provision of transportation facilities. Railways and the mining industry have together played a very important part in the development of several parts of Canada.

The Canadian Northern Railway, recently constructed across Northern and Western Ontario, has opened up for prospecting a large territory. Easy access to many promising areas is now available. Geological maps of some of these areas can be obtained from the Geological Survey, Ottawa.

The Canadian Northern Railway in Manitoba gives access to the Pas Mineral Area. In Alberta the Canadian Northern is serving important coal fields.

THE DEPARTMENT OF RESOURCES CANADIAN NORTHERN RAILWAY

The Department of Resources, Canadian Northern Railway Building, Toronto, will be pleased to furnish information about the districts served.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA]

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - Halifax, N. S.

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,516; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

All applications should be made direct to

Canadian Steel Foundries, Limited, Montreal

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,116,103; Lode Gold, \$93,717,974; Silver, \$43,623,761; Lead, \$39,366,144; Copper, \$130,597,620; Other Metals (Zinc, Iron, etc.), \$10,933,466; Coal and Coke, \$174,313,658; Building Stone, Brick, Cement, etc., \$27,902,381; making its Mineral Production to the end of 1917 show an

Aggregate Value of \$595,571,107

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392.

Production During last ten years, \$296,044,925

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

Serve Milk at every meal

It is a simple matter for the cook to whip Klim into water and serve the best pasteurized, separated milk at every meal. The men will enjoy the perfectly natural, genuine flavor of milk. They will get more food value from it than from any other food you can give them. Klim has a natural, rich, milk sugar content, a valuable consideration in these days of sugar restriction. One tin holds milk solids that require four tins of canned milk with useless water content.

Klim is genuine—The flavor proves it—Drink it.

N INTERNATIONAL MINING CONVENTION AT VANCOUVER.

An international mining convention will be held at Vancouver, B.C., from the 8th to the 10th of January, 1919, inclusive. It will be conducted under the auspices of the Vancouver Chamber of Mines, the officials of which body propose bringing some of the most prominent mining men of the continent to this Province to participate in the proceedings. They take the position that British Columbia's possibilities as a mining centre are just beginning to be realized; that its future in this respect has been to some extent forecast by what has been done in supplying metals necessary in the manufacture of munitions; that the outlook has been further brightened by the discovery and the development to some extent of molybdenite and manganese, to say nothing of platinum; and that its mineral resources have as yet not been exploited in any marked degree. As its history as a mineral producing country has yet to be written, they think both its citizens and the outside world should be brought to more fully realize its riches in this respect and that one of the best means is through a convention of the representative character contemplated and the arrangement of a programme which will be both entertaining and educative.

ENGINEERS AND THE MINING INDUSTRY

In the October Bulletin of the Canadian Mining Institute reference is made to the relations with the Engineering Institute of Canada, the society formerly known as the Canadian Society of Civil Engineers. The secretary urges on members the desirability of consolidating to protect the engineering professions and promises to the Engineering Institute the co-operation of the Mining Institute whenever it may be requested.

To protect the interests of its members is one of the proper functions of any society. Another proper function is to co-operate with other societies on matters of common interest. Obviously, therefore, it is to be expected that there should be co-operation between the Mining Institute and the Engineering Institute on matters affecting the status of the engineering profession. We have no doubt that there will be.

It is a mistake, however, to expect that there will not be differences between these two Institutes. The aims of the two are similar in some respects; but quite different in others. Failure to recognize the points of similarity and difference has been responsible for some unpleasantities in the past. Would it not be well for each Institute to undertake to make the members of the other more familiar with the nature of the respective societies?

To us the essential difference between the Institutes is that one represents an industry, and the other represents a profession.

The Canadian Mining Institute is chiefly composed of technical men. This is a natural consequence of the fact that mining and metallurgical operations are to a very large extent directed by, and carried on with the assistance of technical men. It does not follow, however, that the Mining Institute is a mere technical society. We would be very sorry if it should become such. The aim of the Mining Institute is to develop the mineral resources of Canada. Among its members are several who have had no technical education; but have other qualifications which make them equally valuable as members. They would not qualify, and would have no particular desire to belong to, an engineering society; but they are eminently qualified to take a leading part in the mining and metallurgical industries.

The Engineering Institute of Canada, on the other hand, represents no particular industry. It has, nevertheless, good and sufficient reasons for existence. Comparatively few mining engineers belong to the Engineering Institute because the Mining Institute gives them the advantages of a professional society while it also represents their industry. The professional members of the Canadian Mining Institute will always be found ready to co-operate with the members of the Engineering Institute in efforts to improve the status of the engineering profession.

ALBERTA COAL MINES WILL PRODUCE 6,000,000 TONS THIS YEAR.

J. T. Stirling, Chief Inspector of Mines for the Province of Alberta, who also is the Chairman of the Workmen's Compensation Board of that Province, has just returned after making a stay of some weeks in British Columbia. During this period Mr. Stirling visited some of the coal mining districts with a view to acquainting himself with conditions and also gave some attention to the provisions of the Coal Mines Regulation Act under which the British Columbia mines are operated. He states that in Alberta coal mining never has shown such activity before. The output this year he believes will reach the total of 6,000,000 tons as compared with 4,000,000 tons for 1917. From the Drumheller District alone, which has been opened up for a comparatively short time, there will be a product aggregating at least 1,000,000 tons. New mines are being developed in many sections of the Province and are shipping, many of them, on a small scale.

PRODUCTION OF COAL IN BRITISH COLUMBIA.

In view of the discussion as to the production of British Columbia's coal fields this year, and the possibility of the output meeting at least the most pressing demands both domestic and foreign it is interesting to give the results of a rough estimate made by a high authority. Up to the end of the month of August the production was 1,821,681 tons, and an estimate of the output of the month of September, the returns being not yet available, is 167,301 tons, making a total of 1,988,982 tons up to the last day of last month. From this must be taken 221,840 tons which was used in the making of coke. The total coal marketed from this Province for the first three-quarters of the year, therefore, would be 1,767,142. At the conservative valuation of \$5.50 a ton, this would be \$9,719,281. In this period it is estimated that the Crow's Nest Pass collieries had produced 130,389 and the Canadian Collieries (D) Ltd., 19,196 tons of coke, a total of 149,585, which at a valuation of \$9 a ton, equals \$1,306,265. So the value of the coal production of British Columbia may be said to aggregate approximately \$11,025,546.

COAL MINERS ACCEPT ORDER OF DIRECTOR OF COAL OPERATIONS.

The coal miners strike in the Crow's Nest Pass District is at an end. After being out since the 4th of September, the men went back to work on the 8th of October, having accepted the order of Mr. W. H. Armstrong, Director of Coal Operations. This grants them their demand for a single shift system in the operation of the mines of Fernie and Michel and provides that Mr. Armstrong will request of the Provincial Mines Department that a Royal Commission be appointed to investigate the condition of the mines in question, presumably to establish whether or not the one shift in twenty-four hours is necessary for the protection of the lives of the underground workers.

It is reported that a deal is pending whereby the manganese deposits of the Cowichan Lake District, Vancouver Island, will be put to industrial uses by Vancouver interests. At present the properties are controlled by Mr. C. H. Dickie, of Duncans, V.I.

There is another Yukon and Alaska "stampede" in progress, but in the opposite direction to that of years ago. The generally unprofitable character of gold-mining to-day is felt in the far north, to even a greater extent to elsewhere. There is much talk of government assistance, but apparently little faith that it will be forthcoming.

THE ALLIED METALS CONGRESS.

The Allied Metals Congress at Milwaukee, held October 7th-11th, under the joint auspices of the American Institute of Mining Engineers, the American Foundrymen's Association and the American Malleable Castings Association, was one of unusual importance. Its purpose was to assist in carrying on the war and those who organized the Congress and all who contributed to make it a success have good reason to believe that their efforts will have good results. Many valuable papers were presented and discussed and a splendid exhibit of labor saving machinery was made. Those attending must have profited by the many practical suggestions offered and been stimulated to greater effort by the earnestness of purpose of their fellows. Men who are responsible for the production and manufacture of metals have seldom gathered in such numbers anywhere in America, certainly never with such a serious common object. Not under any ordinary circumstances will one see eight hundred foundrymen listening with rapt attention to technical descriptions of processes of manufacturing cast iron.

Headquarters for the Congress was at the Milwaukee Auditorium. This splendid building is exceptionally well adapted for both exhibitors and meetings. The 165 exhibitors had space in the Arena and Machinery Hall. In the Arena were displayed manufactured products, tools, shop supplies and accessories. In the Arena foundry and metal working equipment was shown in operation. Large and small lecture halls were utilized for the meetings.

Opportunity was given to visit many of the notable plants in Milwaukee and vicinity. A plant visitation schedule was arranged and private cars took the guests to the plants of the Allis-Chalmers Mfg. Co., Kearney & Trecker Co., Falk Co., Chicago & Milwaukee Ry. Co., Wisconsin Gun Co., Sivyer Steel Casting Co., Pawling & Harnishfeger Co., Northwestern Malleable Iron Co., Vilter Mfg. Co., and the Filer & Stowell Co. The great shops of the Allis-Chalmers Co., the Falk Foundry and the Wisconsin Gun Co., where 75 mm. guns are being made, proved particularly interesting to many of the guests.

At the opening session Hon. E. L. Phillipp, Governor of Wisconsin, welcomed the guests. He dwelt on the need of materials for carrying on the war, and asked those present to proceed with their plans for increasing production regardless of rumors of peace. He believed that the end of the war is drawing near, but he thought it very important that there should be no halt in production until peace is an accomplished fact. He ventured the opinion that when peace does come there will be a tremendous demand for materials for reconstruction. Mr. B. D. Fuller president of the American Foundrymen's Association assured him that the foundrymen would not allow peace talk to interfere with their efforts. He congratulated Milwaukee on its war effort.

Mr. E. D. Brigham, manager of the iron ore, coal and grain traffic of the United States railroad administration asked for the co-operation of the metal trade in meeting the demands made on transportation. He said that everything must be subordinated to the demands of the government and that producers must look with patience on shortage of shipping facilities.

Mr. C. S. Koch, of the Ordnance Department, Washington, gave some account of the activities of the Army Ordnance Department, with especial reference to foundry matters. Major Frank B. Gilbreth gave an illustrated talk on military matters of special interest to metal workers.

It was decided that a message should be sent to President Wilson assuring him that the metal industry would

leave nothing undone to accelerate the production of munitions. The following resolution was passed.

"That every resource of these allied metal trades is again pledged to the government not only in the production of materials for the conduct of the war, but for the accelerated manufacture of these materials to enable the government to greatly intensify its prosecution of the war, and to bring about a speedy and crushing defeat of the enemy that will lead to his abject and unconditional surrender."

While the Congress was in session a message was received from Chairman Hurley of the United States shipping board who urged manufacturers to increase their export trade. He said that the U. S. Government was turning out many ships that would be of little use after the war unless manufacturers took advantage of the favorable opportunity for increased export of goods. Chairman Hurley asked for committees to investigate the situation.

One of the notable features of the Congress was the session devoted to manufacture of semi-steel. The opinion was expressed on all sides that semi-steel shells will soon be manufactured in very large quantities in the United States, as they have been in France. In view of this fact the manufacturers who have facilities for undertaking the work took a very keen interest in whatever information was obtainable at the sessions.

The chairman, Mr. John A. Penton opened the session by a short address in which he pointed out that it was expected that many of those present would be called upon to make semi-steel shells. He asked them to follow carefully what was said concerning the manufacture, and to consider whether they could undertake such work. He believed that many plants would be found suitable for the manufacture of such shells. The chairman then introduced three French Army officers, members of the Commission now in Washington.

The experience of the French manufacturers of semi-steel was outlined by Lieut. Laurent. He stated that some semi-steel shells had been made before the war and the invasion of Northern France had made it imperative that a substitute for steel be found. The French Ordnance Department found this substitute in cast iron of the variety known as semi-steel.

The ordinary cast iron shell had not sufficient strength and gave on explosion a comparatively small number of effective fragments. When steel scrap is added to the iron, however, a low carbon iron is obtained. It was found that about 30 per cent. steel gave a very suitable mixture.

The advantages of semi-steel over steel are many. In the first place there is not sufficient steel available to meet the requirements and the use of semi-steel would effect a great saving as it did in France. Then, instead of a few steel working plants it is possible to utilize almost any well equipped foundry to make shells. As foundries are scattered over the country the labor problem is also simplified. The materials used are not only more abundant, but less expensive. Scrap steel and rejected semi-steel will supply a large part of the steel needing in the mixture.

The physical requirements and chemical characteristics were detailed by Lieut. Laurent. He indicated how test bars were taken in French practice and gave the figures for tensile strength, elastic limit, crushing strength. The iron contains 2.75 to 3.25 per cent. carbon. It seems essential that the amount of combined carbon should not be over 20 per cent. of the total carbon. To keep combined carbon low, silica may be used, but the amount must not be large. A good rule is that total carbon plus silicon shall be less than 4.5 per cent. For instance, if total carbon is 2.75 per cent. then silicon should be less than 1.75 per cent.

The effect of manganese, phosphorus, and sulphur were pointed out. In general the action of manganese

is opposed to that of silicon. The amount of manganese that may be used is small. It has been found that difficulties arise in machining the castings if the manganese content is over 1.1 per cent.

In France it is considered good practice to avoid having more than 0.30 per cent. of phosphorus in the iron. From 0.15 to 0.30 per cent. phosphorus is permissible. Capt. Guillemain remarked, however, that in England and in the United States good results seem to have been obtained with iron containing more phosphorus or manganese than is considered good practice in France.

Sulphur seems to have no very harmful effects when present in moderate amounts. It is, however, desirable to eliminate the sulphur because it makes the molten metal less fluid. From 0.12 to 0.15 per cent. sulphur may be present in good castings.

According to Lieut. Laurent about 25,000 semi-steel shells are being manufactured every day in France. They are not as good as the steel shells; but they can be obtained in larger quantities and ordinary foundries can be utilized to great advantage.

C. E. WATSON AND G. O. RANDOLPH LOST AT SEA.

News has just been received of the loss of Chas. E. Watson and George O. Randolph of Cobalt on the "Princess Sophia," shipwrecked on the Alaska coast. Mr. Watson was manager of the Mining Corporation of Canada. Mr. Randolph was assisting him in examining western properties for the Corporation.

IRON ORE IN CRANBROOK DISTRICT, B.C.

Increased interest is noticeable in the iron ore properties of British Columbia, Mr. W. S. Bell announces he is negotiating for the sale of the two red hematite bodies in the Cranbrook District, one of them being on Sand Creek, and the other on Bull River.

Mr. Bell claims these two bodies of ore to be the only known deposits of red hematite west of the Great Lakes, and states the work already done has disclosed a tonnage of almost one million.

One orebody is within four miles of the Crow's Nest branch of the C.P.R., and the second, within nine miles of the same railroad, and therefore within a very short distance of an ample coal supply, with the consequent advantage for locating a smelter in the vicinity.

SHIPPING BOG IRON ORE FROM MONS, B.C.

Shipments of bog iron ore (brown hematite), from the properties owned and operated by Dr. J. G. Davidson and Mr. J. H. Thompson, situated two miles from Mons, B.C., on the P.G.E. Railway, started October 7th. The smelter at Irondale, Wash., has contracted for five thousand tons of this ore, one hundred and sixty tons leaving the mine daily.

Mr. Thompson has been responsible for most of the development on the properties, which were originally staked by Mr. W. J. McClure in April, 1910, and include eight claims, i.e., Iron King, Iron King Fraction, Vulcan number one and two, Summit, Morning Star, Cougar and Empress. Test holes made over the entire property indicate an average depth of from five to six feet, with occasional extreme of eight feet. Several engineers who have examined the property estimate over one million tons of ore in sight.

Typical assays made by the smelting company are appended:

Iron.....	49.47	53.37	58.49
Silica.....	4.15	2.75	2.29
Phos.....	0.068	0.184	.072
Sulphur.....	Nil	0.086	.093
Moisture.....	2.27	1.82	1.63
Ignition Loss.....	25.59	20.80	12.18

Discoveries and Developments in Northern Manitoba

By J. A. CAMPBELL.

Notwithstanding the dearth of men in Northern Manitoba, brought about by military requirements, a certain amount of prospecting has been done this year, and some promising discoveries have resulted.

Lake Athapapuskow—On the border of Lake Athapapuskow several finds have been made which are attracting wide attention. Two of these, made by William Kerr and Fred Vedo respectively, are at the North East arm of the lake almost opposite Goose Creek. They were located early in the season, are in close proximity to each other, and have common characteristics. In each case several claims have been staked and other local mining men are interested with the discoverers. Some stripping and trenching has already been done and several pits sunk. Samples taken from these show chalcopryite and bernite and assays, of which a number have been obtained, indicate that the copper content is from 3 to 4 per cent.

In this immediate district representatives of the Consolidated Mining and Smelting Company of British Columbia, owners of the Trail Smelter have staked several claims. Mr. Gram, an official of the company, spent some time in that country recently. The main characteristics of these claims are similar to those above mentioned.

Farther east, at the extreme end of the lake, is a still more recent discovery made by Jacob Cook, an Indian prospector working for J. B. Cameron and associates. A small camp has been established there and commendable energy shown in investigating the nature and extent of the ore body. Some splendid specimens of chalcopryite and bernite have been taken from this property and assays run quite high. As a result the owners are quite satisfied with the prospects and are endeavoring to make arrangements for diamond drilling the property. If this approximates in extent in any way the Flin Flon property, it will be in the front rank as a producer.

The Pine Root-Chica Claim; Phantom Lake.

Near the mouth of the Pine Root River is situated the Chica claim, one of the earliest discoveries in the district. This was taken over by a syndicate of Duluth mining men of whom Mr. E. A. Separk is the president. Mr. Separk personally inspected the property and has been over a considerable portion of the district. An item of interest that is not generally known is that a diamond drill has been working on this property all summer, and approximately two thousand feet of drilling has resulted. The work is in charge of Mr. W. J. Rashleigh and he and certain other members of the crew are also personally interested in the claim. This work is now being wound up for the season. As is usual in matters of this kind no information has been given out as to the character of the

core. It is a fair inference, however, that results have been reasonably satisfactory as it is the intention to continue the drilling next year. In addition to copper, the assays show gold and silver.

At Phantom Lake, a short distance west of the Mandy mine, Gus Rosen is doing work on claims located by him, and in which some residents of The Pas are interested. These show a variety of minerals, iron and copper sulphide and molybdenite, while assays have also revealed the existence of nickel.

Flin Flon.—Flin Flon camp is temporarily deserted; two years of diamond drilling have proven that the goods are there—over twenty million tons of eight to ten dollar ore. But the development and operation of a property of that extent and character demand conditions where men and materials are readily obtainable, and these conditions most certainly do not exist now. In a recent

Where the original discovery was made at Flin Flon

Some of the buildings at Flin Flon camp

announcement the Hon. Provincial Treasurer intimated that the Government would arrange for the construction of a railroad into the district at an early date. The importance of the carrying out of such a programme can hardly be overestimated and the result would be the removal of the main obstacle to the commencement of an immense copper mining industry.

Examining a new discovery at Phantom Lake

5000 tons of copper ore piled at foot of Schist lake

The Mandy.—On the other hand the Mandy camp on Schist Lake is one of continual activity. Why wait for the railroad when there is an orebody to work on which is solid chalcopryite and the shipping ore runs over 21 per cent. copper? There is now a dump of five thousand tons of this valuable ore at the foot of Schist Lake, ready for the winter haul to Sturgeon Landing over thirty miles away.

This ore has been brought from the mine during the summer by barge, but low water prevented further transportation in this way. Before the season is over the pile will have been increased by an additional thousand tons, and at the mine another fifteen hundred tons will be ready for the teams. Forty-five men, all that can be obtained, are now employed. The shaft is down two hundred feet, with approximately one thousand feet of drifting. Mining operations will continue steadily throughout the winter.

The Mandy Mine

The Mandy copper mine, Northern Manitoba

Mr. Chas. R. Miller, ex-Governor of Delaware, vice-president of the Mandy Company, recently made a visit to the mine and found the work progressing very favorably under the management of superintendent H. C. Carlisle. While at The Pas he made arrangements for the hauling by team next winter of a minimum of ten thousand tons of ore. The contract was let to Mr. C. B. Morgan who has handled this work satisfactorily in the two proceeding years.

5000 tons of copper ore at the foot of Schist Lake. This will be hauled in winter to Sturgeon Landing, and then in summer to The Pas.

It will come as a surprise to most people to learn that already three and three-quarter million pounds of pure copper have been realized from this mine, and it is confidently anticipated that this season's operations will more than double this total.

Copper Lake Sulphides.—Peculiar as it may seem, the most extensive orebody in the whole district is that regarding which there is probably the least general information. A very large body of sulphides consisting of pyrite and nickelliferous pyrrhotite has been located on Brunne and Copper Lakes, which lie about ten miles north-east of Athapapuskow and north of the Cranberry Lakes. The discovery and first locations were made by Hugh Vickers in 1915. He staked four claims for himself and associates. On one of these, the Deighton, the mineralization extends nearly all over the west half of the claim and is continuous for the entire distance of the four claims. The ore assays; iron 30 to 40 per cent., sulphur 20 to 30 per cent., gold a trace to two dollars, silver a trace to a dollar and eighty cents, platinum a trace, copper a trace to 6/10 per cent. twelve pounds to the ton, nickel a trace to 4/10 per cent. eight pounds to the ton. The orebody is so large and so heavily oxidised that systematic sampling has not yet been attempted and the above results were received from massive unaltered sulphides picked at random.

J. P. Gordon who now holds an interest in these claims intends cross-channeling the lode with the intention of cutting through the gossan and heavy oxides and it is hoped that high grade streaks will be uncovered that will give the body a decided commercial value.

J. B. Cameron has done considerable work on a claim to the south-west of the above claims and has exposed a large body of massive pyrites.

Stuart and Moore have a number of claims to the south-west of Cameron's. They have already done considerable trenching and intend working on the orebody during the coming winter. Mr. Stuart advises that their assays have been very encouraging.

Some idea of the size of this orebody may be conceived when it is explained that the body has great width and is continuous for five miles. But when one is on the ground the extent of the body and its irregular shape demonstrates effectually that the property cannot be investigated satisfactorily without the aid of a core-drill. The body contains millions of tons of sulphur (low grade), and if values are found in the base and precious metals, the sulphur contents may possibly some day become worth while.

The districts of Flin Flon, Schist, Athapapuskow and Copper Lakes, will no doubt come into their own as shippers of concentrates when the transportation dif-

Steamer with barge of ore on way from Sturgeon Landing to The Pas.

difficulties are solved, and a railway constructed into the country.

A New Gold Strike.—The sulphides of Copper Lake have taken on a much greater interest of late owing to the spectacular, gold find made by Karl J. Peterson. Peterson's find is in a quartz fissure vein about six feet wide which is cutting across the formation at right angles to the strike. The coarse gold was found within three hundred feet of the south boundary of the Deighton claim and the vein is exposed to where it disappears in the muskeg near the line of that claim. Some of the richest specimens of free gold ever shown in Manitoba have been taken from the Peterson claim.

Mr. Thompson Explains Functions of Office of Fuel Controller

As Fuel Controller for British Columbia, Mr. Nichol Thompson, of Vancouver, B.C., explaining that there appears to be some misunderstanding regarding the functions of his office, has issued a statement in which he enumerates his duties as follows:

- (a) To supervise the distribution of all coal or other fuel imported into or made available within such province.
- (b) To develop the demand for and supply of wood and other coal substitutes to the greatest possible extent.
- (c) To promote and administer any organization prescribed by these regulations within the province.
- (d) To gather and compile statistics dealing with the production and consumption of fuel of all kinds within the province.
- (e) To promote within the province the greatest development of any coal areas available.
- (f) Generally to assist and advise the Fuel Controller of Canada in the discharge of his duties and to enforce any regulations that may from time to time be prescribed by him.

Mr. Thompson continues: "Full powers have been given to the Fuel Controller to handle the situation and regulations have been issued by his department making it compulsory for coal mine operators and dealers to make returns of the quantity of coal produced and on hand and particulars of sales. Broadly speaking his department exercises for the national benefit and in the interests of the Allied governments, the widest possible control over the production, distribution and sale of fuel of all kinds.

"Under orders already issued by the department the price of coal in British Columbia has been fixed and is subject entirely to regulation, as is also the profit which may be made by dealers. There is, therefore, no possibility of profiteering on the part of anybody connected with the fuel business by reason of the demand outrunning the supply; as might easily be the case in a situation such as faces the eastern part of the United States and Canada at the present time.

"I might say that from my official experience the wisdom and necessity of close government control is realized by all fuel interests at the present time, and I have received a full measure of co-operation in carrying out the duties involved.

"There would appear to be some apprehension in the public mind as to the possibility of serious fuel shortage in British Columbia during the coming winter. This is not borne out by the facts, as may readily be demonstrated.

"Firstly, with regard to coal, our principal fuel. The demand for coal at the present time is far in excess of the supply, taking into account the demands for export; but the principle has been established that no coal may be exported without a permit from the Fuel Controller, and it is the policy to take care of the needs of home consumers before allowing export. As an instance, the United States Navy wants 130,000 tons of British Columbia coal during

the current year, but so far it has not been found practicable to give them more than 7,000 tons. The needs of the British Admiralty are considered to be of prime importance and our first care is to take care of bunker requirements of war vessels and British controlled shipping entering our ports.

"There has been a great increase for bunker coal from this source, but it appears likely that 160,000 tons additional will be required to bunker the new shipping now being completed in the Pacific ports of the United States and British Columbia, which will sail during the next few months under Admiralty requisition. As an instance of the operation of the permit existing I might mention that in July applications were received for permits to export 18,000 tons of coal for South American points, but the situation did not warrant the granting of permits for more than 6,000 tons."

Mr. Thompson concludes by summarizing statistically the result of coal mining operations in this Province up-to-date this year, figures which have appeared in these columns from time to time. They indicate that the record of 1917 for the first six months has been excelled. From this he argues that there is no reason to believe that the shortage feared is likely to occur although the consumer is asked to make his purchase of the winter's supply without delay. He concludes with the remark that "it is the policy of this department (fuel control) to urge dealers to create by the end of October a large reserve stock at their various depots, to be available in case of emergency."

OPENING COAL DEPOSITS AT PRINCE RUPERT AND PRINCETON.

The opening up and development in a small way of coal outcroppings is being given more attention in British Columbia as a result of the increased demand and the higher prices received for coal. One of the most important of these is situated on the Grand Trunk Pacific Railway not far from the City of Prince Rupert. The Government has assisted in the construction of a road to the property and the owners and operators are confident that they will be able to take care of the greater part of the domestic demand of Prince Rupert and the adjacent district this winter. Another enterprise of a somewhat similar nature is that of the Osoyoos Coal Co. at Ashnola, nine miles from Princeton, B.C. This has been re-opened and the coal will be "hailed into Princeton by motor trucks for local use and for shipment by railway to outside markets.

COST OF COAL PRODUCTION IS INCREASING.

There appears to be no finality to the upward tendency of costs. In the past year and a half, or two years, the wages of coal miners in British Columbia, roughly speaking, have risen 45 per cent., in addition to a 50 cents a day war bonus. In other words a man who was receiving \$3.65 a day in wages now is getting \$5.79 or, if he works an average of 30 days in the month, which most of the overmen do, he gets approximately \$174 a month. This is small compared to what some of the best coal miners are making, besides being considerably above the scale paid some of the Coal Mine Inspectors. The continued advance in living costs, however, has resulted, according to authoritative report, in the decision by the miners to request a further increase, and it is understood that they have forwarded to the proper quarters a request that the scale be boosted a further \$1 a day. It remains to be seen whether the Fuel Controller will find that this is justified by present living conditions; in comparison with those which existed at the time the last raise was allowed. If the men are supported it will mean, no doubt, corresponding addition to the selling price of coal which went up only a short time ago despite the protests of an indignant public.

Discovery and Exploration of the Belcher Islands*

By ROBERT J. FLAHERTY.

In August, 1910, Sir William Mackenzie, president of the Canadian Northern Railway, engaged the writer to undertake a journey to the Nastapoka Islands, outliers of the east coast of Hudson Bay in $56^{\circ} 5' - 57^{\circ} 50' N.$, for the purpose of examining and reporting upon the commercial value of the iron-ore deposits found upon certain members of the group. Sir William's interest in these deposits was connected with his interest in the new Hudson Bay route for the shipment of grain from the Manitoba grain fields to the European market and the opening of the bay to commerce by rail with Lower Canada and by ship through Hudson Strait with England. The route projected is from The Pas, a branch line terminal of Sir William's (now the Canadian Government's) transcontinental railway, to Port Nelson on the west-central coast of Hudson Bay, thence by ship through Hudson Strait and across the North Atlantic to Liverpool. This is a project which, if practicable—a matter still in question—is interesting not only because it would provide a wheat route shorter by a thousand miles than those now in use, but because it would also make immediately available such resources of the vast seaboard of Hudson Bay as might be found to be of commercial extent and of advantageous situation on or near tide water.

This seaboard bounds an area 1,200 miles long by 600 miles wide, 350,000 square miles of inland sea, and embraces the semi-arable hinterland of northern Ontario and northwestern Quebec, the semi-barrens of the Indians, the barrens of the Eskimos, and an arctic area of perpetual ice-bound sea. Nearly two-thirds of this region, indeed, lies within the subarctic and arctic zones of climate.

The white population of the region numbers some hundred and fifty "fur men," factors of the Hudson's Bay Company and their apprentices. From their posts, six along the east coast and six along the west, two hundred miles apart on an average, they control the trade of the country's native inhabitants, who themselves number less than three thousand all told. Exploration of the "East Main," as the east coast is locally termed, on the part of the Hudson's Bay Company has, despite their two and a half centuries of occupation, been negligible. Under their trading system the native brings his furs to their posts along the seaboard and thus renders unnecessary any expeditions on their part for trade extension—expeditions which would, if made, inevitably involve a certain amount of geographical exploration. Of the score or more of rivers that flow into James Bay and Hudson Bay along the east coast only two have been explored to their sources. The largest river entering James Bay, the Big River, is not only unexplored to its source, but is unknown beyond sixty miles from its mouth. The country's vacant spaces therefore can be imagined.

For such information as we have of the coast and its interior we are indebted largely to the remarkable explorations of the late A. P. Low, of the Canadian Geological Survey, whose work, covering a period of more than twenty years, has given us the most detailed and reliable maps and descriptions of the region available. It was Low's detailed reports of the Nastapoka Island discoveries made in 1877 by Dr. Bell, also of the Canadian Geological Survey, that formed the basis of the investigations which I had been commissioned to make.

How this undertaking, involving three further expeditions extending over a period of six successive years, eventually led to the rediscovery, if such it may be called, of an island land mass more than 5,000 square miles in size, lying along the East Main almost within sight of sailing routes of the Hudson's Bay Company to the west-

ward and within a hundred miles of the company's centuries-old post at Great Whale River to the eastward, is a matter of such interest that I give the incidents here just as they happened.

From the railway frontier of northern Ontario, in late August, 1910, I journeyed by canoe down the Mattagami and Moose Rivers to Moose Factory on James Bay, thence in a small Hudson Bay sailing craft across James Bay to Fort George on the east coast, where, weatherbound, I remained until the formation of the sea ice in December. The journey up the coast was then undertaken with relays of sledges with dog teams and native drivers; the first relay at Cape Jones, the northeastern extremity of James Bay, which marks the southern boundary of the subarctic habitat of the Eskimos; the second at Great Whale River, the most northerly post of the Hudson's Bay Company on the East Main, from which point a final 150 miles brought me to the Nastapokas—a distance all told from the railway frontier of 800 miles.

The Nastapoka Islands, ranging in size from a sea-swept reef to an island thirteen miles in length, are grouped in a chain for a distance of 120 miles at an average of four miles from the mainland, forming the spacious Nastapoka Sound. Save the southernmost they lie beyond the limit of trees; such vegetation as they contain—mosses, lichens, and creeping willows—is typically subarctic. The largest of the ore deposits are located on the two central islands of the group, Gillies and Clarke, which are 12 and $3\frac{1}{2}$ miles in length respectively. Their eastern shore line is broken into a series of cliffs, rising, according to Low, to a maximum elevation of 350 feet, where the various rock members are everywhere graphically exposed. These rocks have been identified by Dr. C. K. Leith, of the University of Wisconsin, as of Animikiean age. His identification he bases on a correlation with the Animikiean rocks of the Lake Superior region, and its interest, economically considered, lies in the fact that it is to these Animikies and the enormous mineral deposits characteristically associated with them that the Lake Superior region in great measure owes its commercial importance.

The examination of Taylor and Gillies Islands completed (the ore deposits were found to be of no present economic interest), I prepared to return to the railway frontier. It was at this juncture that Nero, my driver, one of the only two Eskimos of the seaboard who could speak English, mentioned large island to seaward of the Nastapokas, where lived a tribe of Eskimos whose hunting ground contained great walrus herds, thousands of geese in spring, salmon, seal, bear, etc.—game supply being to a native the only characteristic of a strange land worth consideration. I remembered then, for the first time since leaving Charlton Island en route northward in the preceding fall, a map and interesting information I had received there concerning these same islands from a servant of the Hudson's Bay Company, an Eskimo, Wetalltok by name, head man of the encampment, whom the company had imported from the Great Whale seaboard some fifteen years previously. The map, drawn on the reverse side of an old missionary lithograph, represented Wetalltok's hunting grounds previous to his migration—lands which on the admiralty charts are known as the North and South Belchers, the largest of them not more than six miles long.

The Belcher Island Eskimos.

On the return, to Great Whale River I questioned Harold, post interpreter, concerning the post trade with the island Eskimos and learned how every year the island-

ers, crossing the sea ice, bring bear, seal skins, walrus ivory, and fox skins to barter for tobacco, tea, sugar, matches, bits of finery, powder and shot, and a gun perhaps, if by good fortune there is a "silver" (fox skin) among them. They cross when the ice fields, the largest area of fixed ice in Hudson Bay, are frozen so as to be immovable between the islands and the mainland during the extreme cold months of February and March, a period rarely longer than six weeks. During the remaining months of the year they are isolated from intercourse with the mainland. Harold described how distinctly they differed as a tribe from the mainlanders, not only as to costume in winter, when they wear the feathered skins of eider ducks in place of the mainlander's deerskin, but in speech as well; which, he explained, was more "like the talk of children." He told how primitive they were and how poor as hunters—the latter a damning fault in Harold's Hudson's Bay Company eyes. Harold estimated that the island population numbered some 150 souls, thus corroborating information I had received from Wetalltok and confirming my impression of the extent of their territory.

The Second Expedition.

By June of the following year, 1911, the expedition was under way. I again arrived this time by the Missinaibi route, at Moose Factory and there secured a thirty-six foot sailing craft for the cruise to the islands. To make a long story short, our little craft proved inadequate for the work in hand, and we arrived at Great Whale River post too late to impress a crew for the crossing. Wintering at Fort George, therefore, I waited eight months for an opportunity to cross over the sea ice from Great Whale River, but was again doomed to disappointment when, on the point of making departure with two Eskimos, the field ice broke, disrupted by an extremely heavy gale, an occurrence unique in the twenty-eight years of old Harold's experience.

All thought, therefore, of reaching the islands was abandoned for the remainder of the winter and until the following open season. Whereupon, following an idea that had been shaping itself in my mind, I planned to explore an ore-bearing rock series, similar in character to the Nastapoka series, reported by A. P. Low as occurring along the lower reaches of the Koksoak River in north-eastern Ungava, 100 to 150 miles inland from Ungava Bay. I hoped to find an extension of that series farther north on or near tidewater of southwestern Ungava Bay. The undertaking involved two traverses across northern Ungava through the hitherto unexplored portion of the peninsula; the first by sledge along the 57th to the 59th parallels eastward from White Whale Point on Hudson Bay to Leaf Gulf on Ungava Bay; the second by canoe along the 60th parallel westward from Payne Bay on the Ungava seaboard to the mouth of the Povungnituk River on Hudson Bay. The second traverse was undertaken only when I found that the return journey I had planned ascending the Koksoak River to the height of land, thence by the headwaters of the Great Whale River to Hudson Bay, would, in any event, owing to the unusually late break-up of the Koksoak River, bring me too late on the Great Whale seaboard for the crossing I had intended making that summer to the islands.

The Third Expedition.

So it happened that in October, 1912, a year and seven months after leaving civilization, I again arrived in Lower Canada with the expedition to the Belchers still unaccomplished. However, with a persistence altogether characteristic, Sir William said, "Get a ship." This meant outfitting on an adequate scale at St. Johns, Newfoundland, and proceeding through Hudson Strait and southward along the eastern coast of Hudson Bay. Accordingly the topsail schooner Laddie, of 83 tons register, was purchased from Captain Sam Bartlett, the well-

known Arctic navigator of Brigus, Newfoundland. Captain H. Bartlett was put in command. The crew were: S. Gushie, mate; H. Spracklin, boatswain; McLeary, engineer; W. Robertson, cook; and R. O'Leary, K. French, and J. Robertson, seamen. S. Sainsbury and E. E. Laduke completed the personnel of the expedition.

Though we cleared St. Johns on August 17th, 1913, it was not until a year afterward, late August of 1914, that we finally put into the bay. This was on account of our delayed departure from Newfoundland, which brought us so late into the strait that we were stopped there by winter. Winter quarters were erected in Amadjuak Bay on the south-central coast of Baffin Island, and the ship was sent back to Newfoundland with orders to return the following year over the first open water. During the year we carried out explorations along the seaboard. An attempt was made to explore the unknown coast line of Fox Channel; but an inadequate outfit and impassable rough ice made the project impossible and, at the Trinity Islands, 35 miles west of Cape Dorset, we were turned back. A small portion of the interior of southern Baffin Island was explored as far north as Amadjuak Lake. We compiled an ethnological collection for the Royal Museum of the University of Toronto, and with a motion picture outfit filmed the travel and igloo life and some of the religious performances, conjuring, and dances of the Baffin Island Eskimos.

The Laddie was six weeks en route to our relief, having encountered heavy ice all along the northern Labrador coast and at the entrance to Hudson Strait; in the strait she was nipped in a heavy ice stream which came near sinking her. On the 19th day of August, when we were living on the rag ends of our provision supply, she finally arrived, somewhat bruised at the bow and with a bent propeller shaft, but not beyond repair; and on the 23rd of August we set sail for Hudson Bay.

Arrival at the Islands.

From Cape (Sir Thomas) Smith a course was laid due south and off shore some seventy miles. In latitude 59° we encountered thick, foggy weather, which was continuous to 56° 30'. We had sighted small islands, barren, low masses of trap, all of them less than two miles in length, whose outlying waters were shoal and infested with innumerable reefs. Fearing accident, toward night-fall of September 8th, the ship's course was laid to eastward for sea room over night, but within the hour she grounded on a sunken shoal, where she pounded heavily through the night. When daylight came we made out through the lifting fog a small island a half mile to westward, while to the northeast, the east, and the southeast lay a nest of boiling reefs.

Contrary to our expectations of total wreck, at noon, by aid of the tide and the discharge of her ballast and oil fuel, the Laddie hobbled off unhurt. Our good fortune did not end here, for the watering crew, taking the ship's casks ashore to refill them, climbed a low hill of the small island's northern end and from its vantage saw land to the west extending north and south over nine points of the compass and distant approximately twenty-five miles; obviously it was an island seaboard at least sixty miles in length—identifiable only as the eastern coast line of the Belchers.

That evening we arrived at the northerly extreme of the island, logging twenty-two knots for the distance. From the crest of the shore range, a bold island-free coastline of barren, ice-scoured diabase descending some 250 feet half rounded, like a whale back into the sea, we gained a view of unbroken ranges of land to the westward, barren save for plots here and there of russet mosses, studded with tiny lakes, and extending inland to a horizon twenty miles away, and here, typifying as strikingly the topography of the country as do those of the Nastapokas

and the mainland, lay the Animikies—first the costal eruptives, and beyond them the red bands of shale and marl, the yellow of the quartzites, and the white gray of limestone, all paralleling north-northeast and south-southwest, the trend of the island generally.

A week was spent along the island's east coast. Six miles to southward of this first anchorage we entered a snug bottle-necked harbor, and, while the crew rebalanced the ship and did such overhauling as under the circumstances was possible, we made cross-wise trips inland and a launch cruise to the southward, covering short distances only, however, since we found the ore series we were looking for on the shores of the harbor itself, and detail work upon it consumed most of our time. We kept a sharp lookout for natives, but none were seen; though recent fire places, boulders, and old goose blinds were noted at several points along the shore.

Embarrassed by the unseaworthy condition of the ship, on the morning of September 13th, we cleared the islands, southward bound, to berth her for the winter at Moose Factory. At Great Whale River post the expedition instruments and gear were discharged and stored away against our return islandward the following open season.

Our testimony to the extent of the land we had seen was received both at Great Whale River and elsewhere on the bay with open skepticism and no little "pleasantry" on the part of Company men whose life's experience had been along the Great Whale seaboard.

We arrived at Moose Factory on October 2nd, and there experienced an aftermath of the island shipwreck, when the Laddie, discharged of her ballast and gear, filled to the engine room, but settled, fortunately, on a shallow river bar, over which she lay at anchor until berthed.

Fourth Expedition.

After spending the winter in the confines of civilization we again reached our field of operations in September, 1915, when the Laddie again dropped anchor in the shelter of a Belcher Island sound. On this, our second visit to the islands, the explorations were carried on continuously through the winter and summer until the following September. They were as comprehensive as the limited resources of the expedition in men and means permitted, for only the ship's master, W. Robertson, and a Moose Factory servant, to both of whom I am deeply indebted for what was accomplished, remained with me through the winter and following summer. The remainder of the crew were sent out in October and February owing to our lack of fuel and provisions. By Mid-March our fuel had become exhausted, and the Laddie, now crewless anyway, became the victim of circumstance and afforded us a fuel supply by her masts, yards, bowsprit, rails and cabin—all of her in fact that was combustible. The following open season's work and the final journey from the islands were carried out in the Nastapoka, the same diminutive craft we had attempted to use in our first futile effort to gain the islands from Great Whale River on our second expedition.

Topography and Structure of the Islands.

The island ranges, barren hills, the highest of them not more than 480 feet as determined by aneroid, lie like bands of rounded ribbing, paralleling the islands' trend. This is typical of the Animikean rocks, which were found everywhere to comprise the rock system. Eruptive diabases, extending over a third of the island's surface area, include the more prominent of the ranges and are distinguishable by their conspicuous brown black appearance, by their generally more barren condition, and by their massiveness. They form a striking contrast to the sedimentaries, which lie in folds, synclines and anticlines,

dipping east or west, as the case may be, at an angle which varies from 50° to 5°.

Owing to the absence not only of tree growth but also of soil, except where to a local extent it occupies the floors of valleys, the rock formations are everywhere so well exposed that with a field glass from a distance of six miles or more we were able to locate the white bands of quartzite, the reddish masses of the ore series, and the jet-black hills of the eruptives. This absence of trees and soil was a factor in facilitating exploratory work whose value can hardly be realized by one not familiar with such conditions.

Throughout the interior of the larger islands lakes are everywhere found. They range in size from goose ponds and pools in the peaty tundra of the valleys to the magnificent Kasegaleek Lake (Lake of Seals). The smaller lakes are generally shallow; in many the ice freezes to the bottom, that is to a depth of six feet. The lakes not thus frozen in winter contain an abundance of Arctic salmon and whitefish, the only species of fresh-water fish found and an important source of the islanders' game supply during the open year until the middle of December. Kasegaleek Lake, 43 miles in length and, on an average, 7½ miles in width, occupies the largest and central island of the group. It lies some 40 feet above sea level and discharges from its southwestern extremity through a small river 10 miles in length. This river is broken into a series of lake expansions and descends by rapids, none of them too rugged for kayak travel to the sea. A mile from its mouth it is 200 feet wide, has an average depth of 4 feet, and a current flowing at the rate of 3 miles per hour. The eastern shore line of the lake is composed of almost sheer rugged cliffs and steep hills of diabase, averaging 150 feet in height and extending nearly the entire length of the lake. On the lake's northeastern portion, a U-shaped bay extends eastward to within 1,500 feet of tide water, to which, through a canal, the water of the lake could easily be led, with a fall of 40 feet. The western shore of the lake is less rugged and is broken by islands and long-fingered indentations which run parallel to its length. The islands increase in number to southward, being most numerous in the southwestern portion. The natives say that the lake is extremely deep. Unfortunately I had neither time nor opportunity to make soundings.

Innumerable pools and small lakes on the islands and throughout the low tundra of the western shore are breeding-grounds for geese during the months of May, June, and July. At this season the natives come there to hunt them, to gather eggs, and to fish for the Arctic salmon which then are spawning in the gravels along the shore line and in the mouths of entering streams. Here also they hunt the fresh-water seal, with which, they assert, the lake abounds; hence its name. Its clear, green water, hemmed in by the jet walls of rugged shore, with a traverse that extends to a landless horizon when viewed from either extreme, forms, despite the dearth of trees and vegetation, a picture that is singularly beautiful.

Navigation.

Good harbors, ranging from sounds to small and snug bottle-necked anchorages, occur throughout the islands. With proper charting, the approach from sea, save along the southwestern coast, should not be at all dangerous. The season of open water varies greatly, however. During the year of our residence the field ice cleared on June 10th, and did not return again during the summer. We gathered that this was a very unusual occurrence and was due to the prevalence of northerly winds during May and June when the sea ice was rotting and being broken by the tides. The Eskimos say that in some years the islands have been surrounded by pack ice as late as mid-August, and that ordinarily the annual clearance occurs about the first week in July. For ships built for the navigation of Hudson Strait the average date of approach to the islands

should be approximately the first week in July, if not earlier, since much of the field ice, if still existent, would then probably be rotten enough to offer no obstacle. Obviously only ice observations covering a period of years can yield results of definite value.

Climates.

The climate of the islands differs widely from that of the opposite mainland. Compared with weather reports from Great Whale River for the same period, our observations gave a far greater proportion of overcast skies and fogs, stronger and more constant winds, but higher and more equable temperatures. From October till early December winds of a velocity up to 50 miles were almost constant, and the sky was continuously overcast.

No snow covered the ground permanently until November 15th, and no ice was formed in the small lakes near the wintering base until December 4th, when the long period of winds ceased and a fortnight of calm, clear weather set in. The mercury did not fall below zero until January 2nd—a weather condition without precedent in my experience of the North. Great Whale River early in December had a minimum temperature of —30 degrees and recorded a constant average for the period well below zero.

On January 2nd, winter commenced in earnest. The month was characterized by constant drifting winds of a maximum force of 70 miles; calm days were unknown; and the average temperature was —16 degrees. In February the winds abated; there were many days of sunshine, a few of them almost calm. The average temperature for the month was —19 degrees. Throughout March strong winds again prevailed; by the end of the month the snowfall for the winter had reached its maximum, 4 feet; the average temperature for the month rose to —9 degrees. In April and May there was the usual prevalence of wind, and several blizzards occurred, each covering a period of from one to two days. In the latter part of May the weather broke and became warm and summery; in fact, there were heavy thunderstorms at this time. On May 28th, sledging over the ice fields was at an end, and by June 10th the field ice surrounding the islands had blown off to southward. Then commenced the most trying time of the year; for hardly two days together did fair weather obtain. From mid-June onward to the time of our departure on September 13th, exceedingly heavy gales of wind of from one to three days' duration occurred in every week. The prevailing direction of the winds was south-southwest for not only that period but for the entire year. Days of sunshine were rare; the sky was generally overcast; and rains, accompanied usually by heavy southeast winds, were frequent. According to the natives the weather we experienced during that year was not at all typical; usually, they said, the winds were fewer and less violent, and the temperature during the winter was lower. The remarkable lateness of the freeze-up (December 23rd) was, they said, without precedent. The minimum temperature for the winter was —48 degrees as compared with the lowest mean reported temperature on the mainland of —55 degrees. The maximum thickness of fresh-water ice was 5½ feet, and of sea ice 5 feet. The maximum temperature for the summer, occurring on July 25th at noon, was 70 degrees.

Minerals of Belcher Islands.

Our mineral explorations resulted in the discovery of four distinct ranges of iron-bearing rocks, 30 miles in length and 3 miles apart, one from another, in an east-and-west direction, on the eastern half of the island. The longest continuous outcrop found was 4 miles in length, with an average width of the orebody—if such it may be called, for it is a mixture of ore, jasper, and much other siliceous material—of 30 feet. This outcrop is the northern extremity of a range which follows for 25 miles

the eastern shore line of Keepaloo Inlet. Here from what is the western edge of an enormous syncline the ore series dip 40° to eastward and underlie Omarolluk Sound, 5½ miles across to its eastern shore, where the eastern edge of the fold is found, though in much leaner state and less exposed at surface. These figures may convey to the reader some idea of the magnitude of the largest of the iron ore deposits. No ore of high quality, however, was found. The best, in Keepaloo Inlet, averaged from wall to wall not more than 38 per cent. metallic content—obviously too low-grade a product for present operation in these latitudes. The principal detriment to the ore is silica; as far as phosphorus is concerned it is fairly clean, averaging less than .005 per cent.

In certain contacts between the silicified limestones and diabase on the western slope of Tookcarak Island were found occurrences in small stringers of calcite, of smaltite, and of cobalt bloom. There was no body of calcite, and the distribution of the minerals where found was sparse. Other minerals noted were manganese, occurring in small stringers in iron-bearing slates and chalcopyrites, some of the latter mineral containing as much as 30 per cent. of copper. Neither mineral was found in commercial quantity, however.

Other Expeditions.

In August, 1916, the writer's father, R. H. Flaherty, M.E., Dr. E. S. Moore, professor of geology in the Pennsylvania State College, and W. H. Howard, Dominion Land Surveyor, arrived on the islands. Dr. Moore and Mr. Flaherty made geological and mining reports on the expedition discoveries. Dr. Moore also made a geological cross section of the folds of rock series over the eastern half of the islands. Mr. Howard's work comprised an accurate determination of the position of the islands in relation to known points on the mainland as well as some detail surveys in connection with Dr. Moore's and Mr. Flaherty's reports to Sir William.

During the summer of 1915, that is the summer succeeding our first landing on the islands, the Hudson's Bay Company had made an expedition there with a local James Bay steamer and salvaged one of their sailing vessels which had been carried away by ice the preceding fall from Fort Churchill 500 miles across the bay. She had been reported to Mr. Mavor, the factor at Great Whale River, by migrating Eskimos, whereupon he had sent out his clerk, Mr. E. Renouf, a young Englishman, to verify the report. This Mr. Renouf did, crossing the field ice with two Eskimos, the first crossing over the ice to be made by a white man since Wiegand's in 1849. During our wintering Mr. Mavor and the Rev. Mr. Walton, missionary to the Eskimos of the Great Whale seaboard, visited me. All of this was the more interesting since the bay folk had been sceptical of Wetalltok's "Big Islands" yarn. The Big Islands are ancient history in the bay now, and Wetalltok stands vindicated.

MINING CORPORATION INVESTIGATING MINES IN BRITISH COLUMBIA.

Messrs. C. E. Watson and G. O. Randolph, the former being general manager of the Mining Corporation of Canada, Toronto, which corporation recently purchased the Woolsey silver property, on Silver Creek, near Revelstoke, B.C., have left for Northern British Columbia. Their intention, according to well authenticated report, is to make an examination of the famous Engineer Mines of the Atlin (B.C.) District, one of the best known gold producers of the Canadian West. The Engineer Mine is at present controlled by Capt. Alexander, who takes out considerable gold annually by means of a small stamp mill. For several years Capt. Alexander has brought out every year remarkable samples of native gold. On a number of occasions the property has been under option for large sums and, if Mr. Watson and his associates decide to make the purchase, the deal will be one of importance.

PERSONAL.

Mr. A. B. Clabon, of Vancouver, B.C., is credited with the successful consummation of a deal, by which the Mining Corporation of Canada will take and operate the Woolsey Group at Silver Creek near Revelstoke. The new owners will immediately start building a road, while development work and installation of machinery, will be pushed ahead with all possible speed.

Mr. Walter Vidler, of Boulder, Colorado, is in British Columbia encouraging prospectors to look for rock containing vanadium.

Mr. James Renney, Overman for the past two years at the Reserve Mine, operated by the Canadian Western Fuel Co., at Nanaimo, has resigned his position and gone into business, having taken over the interests of the MacFarlane Wharf Co., Nanaimo.

Mr. Francis John has been appointed Overman at the Reserve Mine to succeed Mr. Renney. Mr. John was Tipple-Boss at the Harewood Mines of the Canadian Western Fuel Co.

Mr. A. L. Rattray, formerly City Clerk at Nanaimo, has accepted the position of accountant with the Granby Consolidated Mining, Smelting and Power Co. at their new Colliery at Cassidy's near Nanaimo, B.C.

Mr. G. W. Bowen, vice-president and managing director of the Canadian Western Fuel Co., has left on a motor trip to California, where he will visit for some weeks, afterwards proceeding to Salt Lake City, Denver and Albuquerque.

Mr. T. E. Godson, Mining Commissioner of Ontario, accompanied by Mr. T. F. Sutherland, Inspector of Mines for that province, has been a recent visitor to British Columbia in the course of a, our of general investigation of the mining departments of other provinces.

Judgment has been handed down dismissing the claim of Robert T. Ward for \$11,000 for a mechanic's lien against the Bullion Mining Syndicate of Quesnelle Forks, B.C. The trial was held at Quesnelle, B.C., on June 28th and 29th of this year.

Mr. Cyril Knight, Mr. A. G. Burrows, and Mr. P. E. Hopkins, of the Ontario Bureau of Mines have returned to Toronto after spending the summer mapping gold areas in Northern Ontario.

Dr. W. G. Miller, Provincial Geologist, is still in England where he represents Canada on the Mineral Resources Committee.

Mr. T. F. Sutherland, Inspector of Mines, has returned to Toronto after visiting mining districts in Western Canada.

Mr. R. E. Hore has returned to Toronto from Milwaukee, where he attended the Allied Metals Congress.

Mr. W. A. Janssen, Canadian Steel Foundries, Montreal, has been elected vice-president of the American Foundrymen's Association.

Mr. M. Y. Williams, of the Geological Survey, has returned to Ottawa after a field season in southwestern Ontario oil fields. Mr. Williams has recommended several areas as worthy of attention and most of the recent drilling is on these areas.

At the Mossa Molybdenite Mine, Quyon, operated by the Dominion Molybdenite Co., mining has, up to the present, been by open pit. Underground mining will be begun shortly, a shaft having been sunk to a depth of 200 ft. for this purpose.

Of the 132,248 barrels of crude oil produced in Ontario during the first six months of 1918, nearly 50,000 barrels came from the new Mossa field.

MINISTER OF MINES VISITS BRITISH COLUMBIA.

Hon. Martin Burrell, Minister of Mines in the Dominion Government, is making a tour of British Columbia. Discussing the work of his department he says: "A large part of the energies of the Department of Mines at the present time is being devoted to an investigation of the production possibilities of such minerals as are necessary in the production of munitions of war. The purpose is to investigate such discoveries as may be reported with a view to securing development if the propositions appear to justify action on the part of the department. We are paying especial attention to platinum, because of the extraordinary shortage of this metal all over the world. The Ural Mountains of Russia were the principal source of supply before the war. Judging by reports which the department has received the Tulameen district of British Columbia is the most hopeful platinum prospect on this continent. To encourage platinum production the department has established a refinery for this mineral at the Vancouver (B.C.) Assay Office, and a considerable production already has resulted." In reference to the production of gold and the serious handicap which this branch of the mining industry labors under existing conditions Mr. Burrell said that the question was an involved one of international concern, and the matter of assistance could not be dealt with until a universal policy was decided upon.

COMMITTEE WILL INVESTIGATE SMELTER CHARGES.

Definite word has been received of the approval by the Dominion Government of the proposed investigation of the affairs of the Consolidated Mining & Smelting Co. of Canada with a view to ascertaining whether in its charges to mine operators and in its general dealing it has been fair to its customers, having special reference to the conduct of the large smeltery at Trail, B.C. The members of the Committee of Investigation, who have been endorsed, are Messrs. S. S. Fowler (chairman) and Ivan DeLashmutt, and James Anderson. Full powers are said to have been granted the Committee to take evidence on oath and arrangements are being made for expert metallurgical and accounting assistance. Mr. Fowler, a graduate of the Columbia School of Mines, is a man of wide experience in mining and smelting matters. For several years he was consulting engineer for the British Columbia Goldfields and many other properties and is consulting engineer for the Yankee Girl Gold Mines. He is best known as the manager of the Bluebell Mine at Riondal, B.C. Ivan DeLashmutt, the Superintendent of the Standard Silver Lead Mines at Silverton, B.C., was for many years with the Anaconda Smelter and later was testing engineer for the Utah Consolidated. He is a graduate of the Colorado School of Mines and for some time held a post as professor of metallurgy at the University of Arizona. Mr. James Anderson is the mayor of Kaslo, B.C., and has had extensive mining interests in British Columbia for many years. He is the agent for the George Alexander interests which control the Nettie L., Ruth, Silver Cup and other properties.

BUILDING MILL AT PRINCETON

Work on the new mill for the Canada Copper Corporation at Princeton, B.C., is underway, the foundation, as far as excavation is concerned having been completed, and a part of the concrete laid. The railway between Princeton and the mill site will be ready for steel by the 1st of November. Immediately upon the completion of this end of the road the grading between the mill site and Copper Mountain will be pushed forward, with a view to providing, at as early a date as possible, facilities for transportation of ore from the mine.

Magnesite quarries in Quebec are now producing about 12,000 tons magnesite per month.

SPECIAL CORRESPONDENCE

NORTHERN ONTARIO.

Nipissing.

Production of silver from the Nipissing mines for the month of September, showed an increase of nearly \$6,000 over the August output, but at the same time was considerably below the average monthly production of the balance of the year. In his report to the president and directors of the company, Hugh Park, manager, says that during the month the company mined ore of an estimated value of \$256,461, and shipped products from Nipissing and customs ore of an estimated net value of \$545,528. The usual amount of underground work was performed at all the shafts. A small vein being encountered at shaft 73; it is one inch wide and assays about 1,500 ounces, but over its present exposed length the average assay is considerably lower than the above figures. The diamond drill has completed operations on R. L. 402. Several holes were drilled for formation purposes. No veins were encountered. The high grade mill treated 98 tons and shipped 513,713 ounces of bullion, while the low grade mill treated 6,348 tons. The following is an estimate of production for the month:

Washing plant.....	\$151,688
Low grade mill.....	104,773
Total.....	\$256,461

The record month of the Nipissing Mining Company for the current year was in June, when \$340,657 was produced.

Will Explore Properties North of Cobalt.

The Mining Corporation of Canada is making preparations for the extensive exploration of the property recently acquired near North Cobalt in the Township of Bucke. The property lies on the west side of the Nipissing Central Railway and was purchased from the railway company during the past summer. The old shaft on the property, which was sunk to a depth of 100-ft. on a promising vein in which cobalt was present, is being timbered and it is the intention of the company to carry this working to a depth of 300-ft. Electrically operated machinery will be used for development. The geological conditions prevailing in the immediate vicinity of North Cobalt are somewhat similar to that occurring in the productive area of the Cobalt camp, and the fact that ore in commercial quantities was never developed in the district is somewhat of a puzzle to leading mining men. However, the recent successful operation of the former Green-Meehan mine by its present owners, indicates more or less big possibilities in the south-eastern Bucke area, which may yet take its place as a valuable silver producer.

Kerr Lake.

The Kerr Lake Mining Company began its fiscal year with a production in September of 208,339 ounces of silver in the first month. This compares with 210,388 ounces in the corresponding month of one year ago, and is considered very satisfactory. The output was approximately 42,000 ounces less than August, but was almost on a par with last year's monthly average. With ore reserves estimated to contain upwards of 1,600,000 ounces of silver, the year is looked forward to with optimism.

The regular dividend of 25 cents per share has been declared payable December 16th, to shareholders of record December 2nd. The disbursement amounts to \$150,000, and is equal to 5 per cent. of the issued capital. The coming dividend will make a total of 20 per cent. paid during the current year, the total disbursement amounting to \$600,000. Since going on a dividend basis on October 4th, 1905, including the dividend just declared, the company will have returned to its shareholders \$8,-

010,000. This is the third highest record of Canadian silver mining companies, comparing with something over \$17,000,000 paid by Nipissing and \$9,240,000 by the Coniagas Mining Company.

Interesting Development Work at Adanac Mine.

The large new vein at the 310-ft. level of the Adanac mine recently encountered in the west cross-cut, and on which drifting is being done is about nine inches in width, the larger part of which is composed of nicolite and cobalt, with ruby silver. The drift is being driven to the south, and is in the Keewatin formation at a point close to the underlying diabase, which is dipping to the south. As the drift advances it draws farther away from the sloping diabase. Veins close to the contact generally show a tendency to split up, or are more or less irregular while a short distance away from the contact, they become more regular. Such is proving to be the case at the Adanac, and those most deeply interested anxiously await the result of each round of shots. On the Temiskaming property, which adjoins, during its early development drifting was carried on along a vein less regular and not nearly so well mineralized as that being worked at the Adanac, when without any other indication a round of shots revealed a high grade shoot of ore which netted the company several hundred thousand dollars, and started the company on its highly profitable career. Thus the present development of the Adanac is fraught with a great deal of interest. Assays from the vein taken recently have given slightly over one hundred ounces to the ton in vein matter in which silver was not visible, while in portions of the vein native silver is in evidence. A small shipment was made during the past month containing approximately three tons of high grade ore. Mr. R. A. Cartwright, president and Mr. E. M. Campbell, director of Ridgeway, Pa., recently visited the property and are confident of the near future placing the mine among the list of important silver producers.

Ore Shipments from Cobalt.

Ore shipments from the Cobalt camp during the month of September amounted to approximately 2,319,515 pounds, including shipments from the Pittsburg-Lorraine Syndicate of South Lorraine and Edwards and Wright, operators of the Green-Meehan property. These figures compare with shipments for the month of August of 2,554,180 pounds. From present indications the current month promises to establish a record considerably in excess of that of the month of September. It is usually the case that shipments during the fall show an increase. In point of silver shipped the Nipissing Mining Company appears to have assumed the lead, while the Mining Corporation of Canada comes second. The large ore reserves of the Nipissing lead to the belief that in future this company will maintain the lead as a bullion shipper from the camp. The company owns a large atreage which as yet has not been entirely explored.

Mr. Alfred R. Whitman, geologist, of New York, formerly of Cobalt, has given up consulting work to take an instructorship in War Topography at Columbia University, in connection with the Students' Army Training Corps. Mr. Whitman during recent years has distinguished himself and become one of the recognized authorities on geological conditions met with in Northern Ontario. Mr. Whitman said, in a recent interview: "I will not again be available for consultation work until after the war. I have definitely committed myself to this war work as long as it may last."

Work is under way on the Giroux property, in the township of Lorraine, near La Tour Lake. A small force of men are at work and additional supplies are being taken in. The property is being worked under lease by Cobalt men, and it is planned to ship ore during the coming winter.

McKinley-Darragh.

The current assets of the McKinley-Darragh-Savage Mining Company of Cobalt, are considerably more than the amount required to meet the dividend requirements for the year 1918, at the present rate of 12 per cent. per annum. The surplus as shown of September 24th, totals \$336,697. In addition to this highly satisfactory financial position, the current earnings of the company are more than sufficient to meet the dividend requirements of 3 per cent. quarterly. In 1917 the mine yielded upwards of 900,000 ounces of silver. While a slight decline in production may be looked for during the current year, output is considered to be fairly well maintained. Backed by this strong financial asset, the McKinley-Darragh is considered to be in a very healthy condition.

Gowganda Mine Will Produce 1,000,000 oz. of Silver This Year.

Production for the current year at the Miller Lake O'Brien property at Gowganda, the second largest silver mine in the Dominion, in point of ore reserves, will probably be about one million ounces, possibly more. Its operation being controlled by a closed corporation, the details are not available, except in approximate figures. Unofficial estimates place the ore reserves of the company at about six million ounces. As a result of the development of such a mine nearly thirty miles from the railway, and in view of the fact that the surrounding properties in a number of instances have similar geology, the past year has witnessed increased genuine and consistent development. In spite of the general shortage of labor throughout the district, the achievement of this company is one of the most notable in the mining history of the North Country. This one great mine has been the groundwork on which the prospects of the district are being developed. The company makes every effort to assist in the happiness of its employees, and with this end in view moving pictures and social evenings are provided by the management.

The Walsh Property, Gowganda.

The Crown Reserve Mining Company of Cobalt is understood to have dropped its option of the Walsh property in the Gowganda mining area, which it has had under option for the past year, and on which development has been carried to a depth of 200-ft. with lateral work at this level and also at the 100-ft. level. During the summer an encouraging vein was encountered at the 100-ft. level and drifted on for some distance, while the shaft was continued to the 200-ft. level and a cross-cut run to the vein at this depth. According to reports the results obtaining during the tenure of the option were sufficiently encouraging to warrant further work. However, a large cash payment fell due about the first of the present month, and when an effort was made to obtain an extension of time, one week was granted, at the expiration of which time the payment was not made and the claims reverted to the original owners. The original owners are said to be making arrangements for the continuation of the development of the property.

The Castle Property, Gowganda.

The shaft at the Castle property adjoining the Miller-Lake-O'Brien mine at Gowganda is nearing the 300-ft. level, where the development program consists of extensive lateral work. According to late reports from the property a vein system for which it was thought a cross-cut would have to be run at the 300-ft. level, cut across the shaft somewhat higher up. The vein is said to be encouraging. The Castle is under control of the Trethewey Mining Company of Cobalt.

A number of other properties besides the three above mentioned in the Gowganda district are receiving attention at present, and on a number of these promising surface indications are said to be present. With the increased activity of the district, it is highly probable further steps will be made to improve the transportation facilities to the camp as soon as the cold weather sets in.

Wright-Hargreaves.

The designing of a mill with a capacity of 150 tons per day for the Wright-Hargreaves property at Kirkland Lake is being proceeded with and the site for the new structure has been chosen. An excellent mill site has been selected just north of the No. 3 shaft on the shore of the lake. It is proposed to equip the No. 3 shaft with a large head-frame and the necessary equipment to meet the requirements of the central or main shaft. The head-frame from the No. 3 shaft will be removed north to the No. 1 vein and used for further work at this point. The designing of the mill at this time will permit of the order for machinery being placed in time for arrival and transportation to the property over the winter roads before spring. Providing nothing unforeseen happens to retard the work, the mill should be in operation next summer. The supply of labor for construction purposes is very limited at present. However, there are many possibilities which might tend to remedy this condition, in which case the work will be proceeded with more rapidly. The mine has been developed to a depth of 400-ft. and there are about a dozen faces in ore. Thus with the completion of the milling plant the property could immediately go on a producing basis.

Lake Shore Mines.

Operations at the Lake Shore mines, Kirkland Lake, continue to be of a highly satisfactory and profitable nature. The company is increasing the capacity of the mill. The September monthly statement showed the treatment of 1,860 tons of ore, and yielded \$44,500. This performance is considerably in excess of the estimated capacity production of the plant, and is chiefly due to the efforts of Mr. R. C. Coffey, the present manager, who designed the milling plant. The mill heads to date have averaged around 125 per ton with all ore coming from development work at the 200 and 400-ft. levels. One of the most significant features of the property is the tendency of the orebodies to show greater width as depth is attained. This is particularly true of the No. 1 vein, where in the west drift more than a score of feet in width of ore is showing in the face of the drift. Such orebodies, wholly intact, except for the amount of work necessary to prove their existence, may be fully counted upon to constitute a huge reserve. The ore at present in sight in the workings of the mine is sufficient to keep the mill operating at full capacity for a number of years to come, and added to this will eventually be greater length and depth of these orebodies. Thus it is highly probable that when the economic conditions become favorable the Lake Shore will enlarge their milling facilities. It is estimated that costs of production at the property are running between eight and ten dollars per ton, thus leaving a profit of \$15 per ton on a capacity of 60 tons of ore per day which is being treated. Upwards of 2½ per cent. every sixty days is being earned on the capital issued. The second dividend is expected early in December. These results have been accomplished under most adverse conditions and with a return to more normal times, the profits of the company would be much greater. The future for the Lake Shore appears exceedingly bright.

Ontario-Kirkland.

Plans for the operation of the Ontario-Kirkland property in the Kirkland Lake district have been consider-

ably enlarged upon. financial arrangements having been made for the carrying out of approximately seventeen hundred feet of underground work. After the completion of installation of the \$15,000 electrically driven mining plant, the shaft, which is now down one hundred feet, will be continued to a depth of 300 feet, where 1,500 of lateral work will be done. It is expected the plant will be installed by the early part of November, and the shaft will reach the 300-ft. level some time in January. A number of strong well-mineralized veins have been opened up on the Ontario-Kirkland property and development work underground will be centred on the vein which the shaft is being sunk on. However, two other strong veins are known to parallel the former, and these will also be tapped at depth to determine values.

Frank Huth, of Nazareth, Pa., president of the company, accompanied by William F. Meyer, of Bethlehem, Pa., and Walter E. Hurd, of Philadelphia, have recently paid a visit to the property. The claims which comprise the holdings of the company were formerly known as the Hurd group.

Kirkland Lake Gold Mines.

With the new mill almost completed at the Kirkland Lake Gold Mines property, much speculation is rife in the district as to whether it is the intention of the company to press the plant into service at once or not. Sufficient ore of a good milling grade has been blocked out underground to keep the mill in operation for some time and a large amount of ore is on the dumps ready for treatment in the new mill. However, whether or not milling operations are to be commenced has not yet been announced.

A central shaft is being sunk on the property with three compartments and will be connected with the various levels as the work proceeds. The underground workings of the Kirkland Lake Gold have been carried to a depth of 700-ft., the deepest in the Kirkland Lake Camp, and at this depth the mineral deposition proved consistent with the upper levels of the property and showed no signs that it would not continue to much lower depth. Almost a million dollar's worth of ore is said to be blocked out in the mine.

The Beaver Consolidated Mining Company, of Cobalt, which controls the Kirkland Lake Gold, owns nearly all the stock of the concern and have financed the development of the property and erection of the mill, and it appears reasonably sure that the shareholders of the company will eventually reap the just rewards of the energetic endeavors of their president and directors in their comparatively new mining venture.

Miller-Independence.

Drifting operations are under way both east and west at the 200-ft. level of the Miller-Independence Mine at Boston Creek along the big orebody. In the meantime the mill has been completed and the necessary additions made, and is now in readiness for operation. The capacity of this plant is approximately 40 tons per day. Owing to the richness of the ore to be treated, however, to make sure of good recovery only about twenty tons per day will be fed to the mill. Lack of water has formerly been one of the inconveniences at the Miller-Independence, but a dam has been constructed and an artificial pond made which will provide sufficient water for all requirements.

Additional working forces and two more machines are to be employed immediately. With the orebody at the 100 and 200-ft. levels being developed and a large amount of high grade ore already conveyed to the dumps, a considerable portion of which runs several hundred dollars to the ton, and in some instances well over one thousand dollars, the condition of the property and outlook for the future is exceedingly bright. The results of the first operations of the renovated mill are being looked forward to with keen interest.

Patricia Mine.

Four machines are now employed on development work at the Patricia Syndicate property at Boston Creek. According to recent advice, results being met with are proving highly satisfactory. Lateral work is being carried on at the 100 and 200-ft. levels, where either new veins or the continuation of those previously known are being developed. The steady wet weather of the past two or three months has made the matter of securing fuel a very serious problem. The swamp lands from where the wood was being obtained, have become almost impassable for horses, with the result that milling operations were suspended. This difficulty it is thought will be overcome with the arrival of cold weather.

Gold on Cotter Property.

A vein in which visible gold occurs has been opened up on the Cotter property at Boston Creek. The vein was picked up at a point within two or three hundred feet of the north-east corner of the Miller-Independence Mine. The strike of the new vein is directly toward the rich vein on the latter, and is thought to be a continuation of this vein. It has a width of from four to upwards of five feet and is dipping to the south. A diamond drill has been set up a little south of the vein and drilling has started. The first hole is being driven at an angle of 55 degrees pointing towards the north.

Work Begun on O'Donald Claims.

Work was commenced about the middle of the month on the O'Donald claims in the Boston Creek district, which are under option to Robert W. Norrington and his associates of Detroit, who also are operating the Cullen-Renaud group of claims in this district, with good results. The O'Donald is situated directly between the R. A. P. Syndicate and Patricia Mine. Although exceedingly well located and several times under option, during the course of which numbers of promising veins have been located on the surface, it has never been extensively explored, nothing more than surface prospecting, trenching and the sinking of test pits having been done.

Howie-Couchenour.

The mining plant at the Howie-Couchenour property in the Lightning River area has been in operation for the past couple of weeks and it is expected that from this time forward much better progress will be made. Difficulty in the transportation of supplies to the district up to the present time has proven a retarding factor. The shaft is down to a depth of about forty feet, at which depth the vein is about two feet in width and is understood to carry commercial values. The vein occurs in basalt formation at outcrop, while before attaining any great depth it is expected to enter the rhyolite formation which occurs in contact with the basalt at a point near the shaft. The rhyolite is dipping at such an angle as to indicate the likelihood of it cutting through the shaft a few feet below its present depth.

According to reports brought out from the Lightning River district by prospectors travelling out by way of Kirkland Lake, a promising vein has been found on the claims of Alex. Perron, situated about one mile east from the Howie-Couchenour property. The vein is reported to be about four feet in width and is said to contain visible gold.

The Lightning River Area.

The Ontario Bureau of Mines is preparing a report on the Lightning River Gold Area, covering the geology as well as the discoveries made to date. The field work has been completed by A. G. Burrows, geologist for the Bureau of Mines, and Cyril W. Knight, assistant provincial

geologist. One feature of the report will be the definite mention of rhyolite formation. Heretofore rhyolite found in this part of Ontario was usually in a more or less altered state. However, such is not the case in the Lightning River district where the rock is found in an unaltered condition and in a clearly defined body. At Telluride, Colorado, silver and gold bearing veins have been found to occur in the rhyolite formation, thus, the addition of this formation to the other list of formations in which precious metals are likely to occur in Northern Ontario, may prove of much importance. The report will not be ready for distribution for some time, but when published will prove a valuable guide to prospectors and property owners in the district.

Good Year for McIntyre.

The belated annual report of the McIntyre-Porcupine Mining Company, for the year ending June 30th, 1918, shows total profits of \$811,571 as compared with \$716,722 during the previous fifteen months. The company reserved \$131,210 for depreciation as compared with \$114,736 a year ago and transferred to surplus account \$680,361, as against \$725,790 in the previous fifteen months. Dividends of 15 per cent., on the outstanding capital were paid, amounting to \$541,542 as against \$361,028 the year before. The surplus carried forward from the previous year was \$741,903, while for the current year \$872,172 was carried forward. The year's surplus after dividends and depreciation was \$139,000. The rate of profits on capital stock was nearly 18 per cent.

Owing to the fact that the company found it necessary to speed up development work on optioned properties with a limited staff the ore reserves show a slight decline from last year. Important new orebodies, however, were put in sight.

The outstanding bonds of the company were retired at maturity August 15th, 1918, which leaves the property free of all encumbrances. Approximately \$300,000 has been spent during the past two years in plant and equipment. Diamond drilling on the Plenaurnum property appears to have disclosed the presence of some good orebodies at a depth of 1000-ft. where the drift was extended from the Jupiter property and diamond drilling done.

The annual meeting of the company has been called for the 26th of October, at which time a vote will be taken to determine whether or not the company will exercise its option on the Plenaurnum property.

A dividend has been declared payable by the company to shareholders on record November 15th. The disbursement, which is of 5 per cent. will be made on November 30th, making the sixth dividend to date, three of which were made during the current calendar year and three during 1917. The present disbursement calls for \$180,514.15 and makes a total amount paid of \$1,083,084.90, since going on a dividend basis, February 15th, 1917.

The fact that the company holds such an enviable position to-day despite the strains of war conditions and is able to disburse such liberal dividends is concrete proof of the excellent physical condition of the property, and proof of its excellent management.

GOLD PRODUCTION OF NORTHERN ONTARIO.

With only three of the larger mines producing gold, that is the Hollinger, McIntyre and Lake Shore, and three of the smaller mills running, that of the Dome Lake, Davidson, and the Miller-Independence which is just starting up, it is particularly significant to note that the gold output from Northern Ontario for the current year is slightly exceeding that of 1917. The high grade ore of the Hollinger, McIntyre and Lake Shore has saved the situation. With a return to normal conditions the lower grade mines will be a big factor. Added to this will be the mines now in process of advanced development.

The following is a summary of milling facilities at the gold mines, with figures showing the approximate capacity of each:

THE PORCUPINE GOLD CAMPS.

Mine	Daily Capacity in Tons	Present Rate
Hollinger.....	2,800	Half
Dome Mines.....	1,350	Closed
McIntyre.....	600	Full
Schumacher.....	200	Closed
Porcupine Crown.....	140	Closed
Porcupine V. N. T.....	120	Closed
Dome Lake.....	75 to 100	Full
Davidson.....	70	Full
Totals.....	5,355	

THE KIRKLAND LAKE GOLD CAMP.

Kirkland Lake.....	150	New
Tough-Oakes.....	140	Closed
Teck-Hughes.....	80	Closed
Lake Shore.....	60	Full
Total.....	430	

BOSTON CREEK GOLD CAMP.

Patricia.....	40	Closed
Mill-Independence.....	40	Half
Total.....	80	

MUNRO TOWNSHIP GOLD AREA.

Croesus.....	50	Closed
Hill Gold Mines.....	50	Closed
Total.....	100	

Thus, in summarizing the gold camps, we have the following:

Camp	Tons Capacity
Porcupine.....	5,355
Kirkland Lake.....	430
Boston Creek.....	80
Munro.....	100
Total.....	5,960

Of this huge total, but slightly over one-third is being utilized, or some 2,102 tons daily. Therefore, the assertion that gold production from the Northern Ontario mines is being comparatively well maintained, and about on a par with 1917 is full of significance. With conditions returned to more or less normal, and milling facilities of close to 6,000 tons daily pressed into full service, it is not too much to expect that the output will closely approach \$20,000,000 annually. In addition to this are a number of properties awaiting favorable conditions at which time they will proceed with the construction of mills.

Therefore, without taking into account the numerous properties with exceptionally good prospective merit, as well as the enormous stretch of as yet unexplored territory, and by dealing only with the already proven mines, the gold mining is looming large.

THE MONTAGUE MINE

Within the last few months the Montague property has been reported on by A. A. Hassan and more recently by C. A. Burdock for New York capitalists. This property appears to be the most promising at present in Nova Scotia. The present work is confined to the Skerry Lead below the flat reverse fault that cuts this vein at a depth of 65 ft. Some extraordinary pockets or enrichments have been met with in the last three years. These enrichments are associated with stringers or angulars entering the main lead, and it is the experience of those working the vein that only angulars entering from the north cause enrichments. The vein averages about four inches in width and in value two and one-half ounces per ton.

SHAFT UNWATERED AT GOLDENVILLE.

Mr. John Warner, formerly underground manager of the Boston Richardson Mine, has been appointed manager of the Goldenville Consolidated Mining Co. This company has recently unwatered the Wellington shaft which has not been in operation for thirty-five years. The intention is to sink this shaft 200 ft. and develop the Wellington Lead and the Dewar Lead, 110 ft. to the north.

USING KEROSENE OIL ENGINES IN NOVA SCOTIA.

The kerosene oil engine appears to be meeting with success as a substitute for steam power at a few of the mines. This form of power can be adapted to the Nova Scotia Gold Mines, where with narrow leads the power requirements are small and the fuel question, always serious, has become impossible. Wood, the fuel chiefly used, is scarce in close proximity to the mines and it has become extremely difficult to get men to cut it. The oil engine is being used in some of the stamp mills which, due to narrow veins and small outputs, are only operated five or six days in the month.

WORKING MOLYBDENITE AT NEW ROSS, N.S.

The molybdenite deposit at New Ross, Lunenburg County, is being developed by the Nova Scotia Molybdenum Co., Limited, under the direction of Mr. H. C. Burchell, of Windsor. The ore is associated with a pegmatite dike in the granite area that covers the western end of the province. The molybdenite occurs in rather small flakes, irregularly distributed through massive quartz containing practically no other mineral but red felspar. A shaft has been sunk 100 ft. in the orebody. Two or three small shipments of ore have been sent to the Government Testing Laboratory, Ottawa, and have shown one-half to one per cent. molybdenum sulphide.

DEVELOPING TUNGSTEN DEPOSIT AT MOOSE RIVER.

The Scheelite Mines, Ltd., is doing a small amount of development work on the tungsten property at Moose River. The mill has not been in operation for several years, but about 250 tons of 10 per cent. ore has been mined and ready to be treated. A trace of platinum and gold estimated at 0.04 oz. per ton were found by an assay made at the laboratory of the Department of Mines, Ottawa, from heavy Wilfley table fines. Sperry-lite is thought to be the mineral present.

FOUR DRILLS IN OPERATION AT STIRLING, CAPE BRETON.

The Stirling zinc-copper-lead deposit at Stirling, Richmond County, Cape Breton, is being extensively drilled. Four drills are in operation and the company claim to date about 700 ft. orebody as proven. The ore occurs in altered igneous rocks and is composed of zinc blende, chalcocypite, pyrite and quartz. Assays made at the laboratory of the Mines Branch, Ottawa, show values varying from 4 to 30 per cent. zinc with as high as 7.5 per cent. lead and 3.5 per cent. copper, also traces of gold and silver. The ore is very complex.

DEVELOPING SALT DEPOSIT AT MALAGASH, N.S.

A deposit of rock salt thought to be the first discovered in Canada is being developed at Malagash, Cumberland County. A shaft at present 105 ft. is being sunk and is already twenty feet in salt.

Bore holes have proved about 600 square feet of salt with a thickness of about 40 feet. The salt is interbedded with limestone and gypsum.

THE VOIGHT COPPER CO. CASE.

The action for \$75,000 lien or damages which Edward T. Beck and Edward H. Grunder and the Voight Copper Co., instituted against Mr. and Mrs. Emil F. Voight arising out of a deal for the Voight copper claims at Ashnola, near Princeton, B.C., has been dismissed by Mr. Justice Clement of the Supreme Court of British Columbia, in a written judgment. The dismissal is without prejudice to plaintiffs' right to sue for a charge of \$19,000 not dealt with under the judgment. The counter-claims of the Voights for payments under an agreement was also dismissed, but without costs. Beck and Grunder claimed to have secured an option on the claims and organized the Voight Copper Co., and to have spent \$75,000 in improvements to the property when they were cancelled out by the Voights.

His lordship in his judgment finds that Mr. Beck in 1916 made it clear to the Voights that there would be no more funds forthcoming unless the Voights at once conveyed the property to the Voight Copper Co.; that the Voights were willing sellers, but refused to abandon their safeguards under their agreement and to convey until the full amount of the purchase price was paid. His lordship finds that the plaintiffs failed to carry out their part of the agreement for an active programme of development and therefore are not entitled to a lien or charge for the monies gone into the property. Mr. E. C. Mayers appeared as counsel for the plaintiffs and Mr. A. H. MacNeill, K.C., as counsel for the defendants.

SHIPMENTS TO TRAIL SMELTER.

With three-quarters of the calendar year gone, the ore shipments to the Trail smelter, Consolidated Mining & Smelting Corporation of Canada, continue to be somewhat smaller than they were for the first nine months of 1917—the figures being 277,664 gross tons for 1917 and 245,375 tons of ore and concentrates for the same period this year. Thus 1918 is 32,289 tons behind 1917 for nine months. September of 1918 has a total of 21,765 tons received against 39,293 tons for September of last year. The chief cause of the falling off this year in ore tonnage is the fact that for several months the Rossland Mines have been worked only on a limited basis, this being due to the present conditions attending the production of gold. Rossland ores, however, contain as well a few pounds of copper per ton and its withdrawal has resulted in the operation at Trail of only one copper furnace, which is handling, almost entirely, rich custom ore. On the 1st of October last year there were 142 mines shipping to the Trail smelter while at present there are but 112 different mines on the shipping list.

HAZELTON GOLD.

Mr. Nicol Thompson, chairman of the Board of Directors of the New Hazelton Gold Cobalt Company, submitted a report of development progress at the recent annual meeting of the directors. A shipment of molybdenite ore from this property was recently made to the government sampling works in Ottawa and the gross value was \$109 a ton. Another carload of the ore was being packed for shipment to the Anyox smelter, Granby Consolidated Mining & Smelting Co. The latter had been sorted more for its gold value but contained also a considerable amount of cobalt.

Recent British Columbia incorporations include, Silver Creek Mines, Ltd., Revelstoke, capital, \$750,000; International Coal Co., Ltd., Vicotira, B.C., capital, \$50,000.

SMELTERS ENQUIRY OPENS AT NELSON.

After marking time for several months there has been received a definite announcement as to the plans of the committee appointed by the Associated Boards of Trade of Eastern British Columbia to conduct an investigation into the matter of the treatment rates charged by the Consolidated Mining & Smelting Company of Canada Ltd. at its Trail Smeltery. The first session will be held at Nelson, B.C., on Thursday, October 31st, and is called, according to public statement, "to receive evidence from shippers of ore to Trail." That the inquiry is to begin immediately is taken as indicating that the members of the Committee have been given assurances by the Dominion Government that the expense of a thorough investigation into the grievances of the mine operators affected will be covered and that they have got authority to examine witnesses on oath, two demands which they made as a condition of their continuing the work.

MARKETS**TORONTO MARKETS.**

**MINE HOISTS to suit YOUR NEEDS**

We are specialists in the designing and building of Hoists. For about a quarter of a century we have been concentrating on this work, and the experience we have been accumulating through these years is at your service to enable you to equip your mine with just the Hoist you need.

We offer you Hoists for Steam Drive, as illustrated, either with boiler or without boiler, as preferred.

We also offer you Hoists for Electric Drive, or for Belt Drive.

In either of the above we offer a choice of 7 sizes, ranging from 10 to 50 Horse Power, and with any diameter Drum up to four feet diameter at the bottom of the flanges.

If our standard built Hoists in any one of their hundreds of sizes, are not suitable for your work, we are prepared to design for you a special Hoist exactly suited to your needs.

Let us serve you, and save you money.

MARSH ENGINEERING WORKS, LIMITED, BELLEVILLE, ONTARIO

Established 1846

WILL USE B. C. BOG IRON ORE.

Bog iron from British Columbia will be in use shortly for fluxing purposes at the furnaces of Irondale, Wn., arrangements having been made by the owners of the property with the Pacific Coast Steel Co. The same company is using the magnetite ores of Texada Island, British Columbia, and the product of its plant is to be utilized in connection with the building of ships in the Puget Sound district. The contract entered into for bog iron calls for the delivery of 5,000 tons as soon as possible and a spur line is being run from the Pacific Great Eastern Railway to the property, which is situated near Mons, B.C., in order to provide satisfactory transportation facilities.

AN ORE SAMPLING PLANT FOR BRITISH COLUMBIA.

At a meeting of the Vancouver Chamber of Mines held recently, Hon. Martin Burrell, Minister of Mines, delivered an address in which he stated that an ore sampling plant would be established in British Columbia by the Dominion Government. He said that the matter had come before him some months ago. Mr. George MacKenzie, of the Department of Mines, now at the head of one of the parties engaged in field work in the Province, prepared a memorandum on the subject which convinced him that such a plant would be a material aid to the mining industry in British Columbia and that it also was required in the Province of Nova Scotia. In this connection the Minister referred to the high cost of the transportation of ores to the Government plant at Ottawa for treatment there, and wound up by declaring that the mining men of the West might rest assured that the matter would not be neglected.

PLACER MINING IN ATLIN DISTRICT, B.C.

Mr. Frank Mobley, member of the British Columbia Legislature for Atlin District, has returned to the Coast after spending the season in the placer mining section of the district. He speaks more optimistically than most of those who refer to the gold production of the North. While the output has been reduced 25 per cent. owing to lack of labor, according to Mr. Mobley, mining is said to be more profitable than it has ever been "because the methods of mining are improved." Formerly it was possible to make only four-ounce ground pay whereas now profits can be made out of two-ounce ground. Mr. Mobley summarizes the season's work on the various placer waterways of Atlin as follows: "Ruby Creek Hydraulic Mine has done very well; Boulder Creek, fair; at Birch Creek there has been a scarcity of water, and the output has been small; Pine Creek has had a fair season; McKee Creek did practically nothing owing to having to cut through a new channel; Otter Creek has had a good output and all the individual mines have given good returns. The general output, however, has not been more than 60 per cent. of that of former years.

ALASKA MINERS IN DANGER.

That there are several thousand miners and prospectors in the Kuskokwim River district, Alaska, threatened with famine is the effect of a report brought from the North by the captain of the power steamer, Ruby, which has just reached Seattle, Wn., in a damaged condition. This boat, which was the only one to set out with food and other necessities for the miners of the Kuskokwim, was unable to complete her journey because of heavy storms which drove her into Seward, Alaska, for shelter. The prospects of getting relief to these people, it is said, are slim as it is believed to be too late for another vessel to make the trip.

Oxy-Acetylene Welding and Cutting**Conservation vs. Waste**

Oxy-Acetylene Welding is proving a great economic factor in the Factories, Mills, Railroads, Mines and Machine Shops of Canada. The Nation's scrap pile is one of the worst enemies of Conservation. Hundreds of thousands of dollars' worth of damaged, worn, or broken tools, castings, pipe and machine parts lie rusting on the scrap piles of this country. Much of this enormous waste is now being eliminated by Oxy-Acetylene Welding. Losses due to breakdowns—resulting in "tie-ups" of operating equipment—are also being greatly reduced.

**Prest-O-Lite
PROCESS**

is ideal for all classes of metal repair work. It handles repairs quickly and efficiently—often right on the spot—makes broken or worn parts strong as when new—saves time which would be wasted waiting for replacements—abolishes the "Scrap Pile."

The welding outfit is portable—available for outside work as well as for shop use.

No matter what other welding method you now use, a Prest-O-Lite outfit put to work in your shops will quickly pay you profits.

Write now for special literature and data that will point out ways to reduce waste and increase efficiency.

BUREAU OF MINES

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium, petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth \$72,093,832, of which the metallic production was \$56,831,857.

Dividends and bonuses paid to the end of 1917 amounted to \$11,486,167.45 for gold mining companies, and \$70,821,829.34 for silver mining companies, or a total of \$82,307,996.79.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

The Mineral Springs of Canada. Part II., by R. T. Elworthy, B.Sc.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

*The Babbitt Metal that's at the
Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.!

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.

Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

Blasting Accessories

E. B. Caps Made in No. 6, No. 7 and No. 8 strengths. No. 8 being twice as strong as No. 6. We strongly recommend our strong blasting caps. They more than pay for themselves in decreasing fume and getting increased work from the explosive.

Blasting Machines Made to explode from 10 to 150 E. B. Caps. These batteries are made with particular care and can be absolutely depended upon to do the work.

Connecting Wire Is especially adapted for our E. B. Caps. Experience has proved that the additional capacity of 20 gauge to carry ample current for a large number of caps more than covers the additional cost.

Leading Wire Made single and double strand. Our single strand leading wire is made of copper wire, is well insulated and adapted for use in larger blasts. Double strand insulating wire is found convenient for use in mines or other places where wires have to be moved frequently.

CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO

No. 22

THE B. GREENING WIRE CO., LIMITED
HAMILTON, CANADA

The Canadian Mining Journal, Purman Bldg. 263-265 Adelaide St. West, Toronto, Ont.
Published on the 1st and 15th of each month. "Entered as second-class matter, April 23rd, 1908, at the post office at
Buffalo, N.Y., under the Act of Congress of March 3rd, 1879."

Increase Your Drilling Speed

You can greatly increase your drilling speed and reduce breakage of steel and drill parts by using bits of some one of the improved models that can be made in the SULLIVAN SHARPENER.

One of these models is the

DOUBLE ARC BIT

Double Arc Bit

Sullivan Automatic, Variable Gaging Dies

Using the Double Arc Bit, one of the largest copper companies in the country secured the following results :

Bit	Gauge Changes	Drilling Speed, Inches per Min. in		
		Iron	Quartz	Porphyry
Cross	1 1/2	1.53	2.65	5.1
Double Arc	1 1/2	3.05	4.15	5.56
Double Arc	1 1/16	4.06	5.52	7.75

At this mine, steel breakage has decreased from 10.5% of the steels used to 1.5%, due to the use of smaller gauge changes.

Forge your bits in the new

Automatic Variable Gage Dies

With this Sullivan device, you can make bits of 16 different gages, using one set of dies. The adjustment is by thumb-screw. It's a hammer-swaging action.

HAMMER YOUR DRILL BITS!

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

The New CCW-21 Water Stopper

Kills the dust without drowning the miner

The new CCW-21 Water Stopper has several novel features in connection with the water feed that will at once appeal to the experienced miner.

In the first place the water feed is through the front head.

Secondly, the water feed, operated on the injector principle, is not only powerful but under absolute control at all times.

Leakage back to the cylinder with all its freezing troubles is prevented by air packed rings in the anvil block.

A special throttling device in the supply line prevents more water being used than is just enough to lay the dust.

"TESTED"

The Last Word in Rock Drills

TESTED—the clinching quality or proven durability—means much to rock drill users. It means sure service—a long life for the Drill—and durability wherever used, with no long stops for repairs, because it is proven service.

Hundreds of Cleveland users after a long service of constant use against all conditions have sent back the verdict that for durability, labor and time saving "Cleveland" excels all.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

OPPORTUNITIES

--for--

Prospectors and Mining Companies

The mineral wealth of Northern Ontario is enormous. From a few developed areas a very large output of nickel, copper, silver and gold is being made. Many promising areas are awaiting the prospector and miner.

Recently Northern Manitoba has become an important producer of copper ore, and many promising gold deposits have been located. This is an excellent field for the prospector.

One of the greatest factors in development of mineral areas is the provision of transportation facilities. Railways and the mining industry have together played a very important part in the development of several parts of Canada.

The Canadian Northern Railway, recently constructed across Northern and Western Ontario, has opened up for prospecting a large territory. Easy access to many promising areas is now available. Geological maps of some of these areas can be obtained from the Geological Survey, Ottawa.

The Canadian Northern Railway in Manitoba gives access to the Pas Mineral Area. In Alberta the Canadian Northern is serving important coal fields.

THE DEPARTMENT OF RESOURCES CANADIAN NORTHERN RAILWAY

The Department of Resources, Canadian Northern Railway Building,
Toronto, will be pleased to furnish information about
the districts served.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA]

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - **Halifax, N. S.**

Commissioner of Public Works and Mines

PROVINCE OF QUEBEC MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS.

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of Laval University, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,

MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Flotation Process

All patent and other rights to this process
in North America are now controlled by

Minerals Separation North American Corporation

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 94,510; 94,718; 96,182; 96,183; 99,743; 127,397; 129,819; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,587; 163,608; 163,707; 163,936; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES adjudged our basic patent for air-froth flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision and, at a recent trial in the United States District Court at Butte, Montana, Judge Bourquin admitted these claims as amended.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

Prospective users of our flotation processes are earnestly requested not to be misled by the mistaken views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

NOTICE

Notice is hereby given that we will enforce our patents and stop all infringements, but are prepared to grant licenses for the right to use all or any of our processes to those who wish to use them. To those who infringe or have infringed our patents, notice is given that a settlement for such infringement must precede the granting of licenses for the future use of same.

Notice is further given that no one is authorized to introduce our processes or apparatus into the United States, Canada or Mexico.

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,116,103; Lode Gold, \$93,717,974; Silver, \$43,623,761; Lead, \$39,366,144; Copper, \$130,597,620; Other Metals (Zinc, Iron, etc.), \$10,933,466; Coal and Coke, \$174,313,658; Building Stone, Brick, Cement, etc., \$27,902,381; making its Mineral Production to the end of 1917 show an

Aggregate Value of \$595,571,107

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392.

Production During last ten years, \$296,044,925

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

WILFLEY TABLES

AT THE NEVADA CONSOLIDATED
COPPER COMPANY

Latest Model No. 6 Wilfley Table with enclosed self-oiling head motion.

Wilfley Tables were used at this plant for many years, and when 84 additional double-deck tables were required for increasing capacity—there was but one choice—*Wilfley Tables*.

During the past 20 years more than 22,000 *Wilfley Tables* have been built, and more of them are being purchased today than ever before.

The universal popularity of *Wilfley Tables* is due to the following reasons;

Highest efficiency in metallurgical extraction—

Great capacity—Mechanical perfection—

Extreme simplicity of construction.

The *Wilfley* will recover the biggest percentage of values from your ores, and do it at the lowest cost.

No. 9 Double-Deck Wilfley—Two Tables in the Floor Space for One

We also manufacture the Pierce Gold Separator and Amalgamator for placer mines and dredges, mills and cyanide work. Write for Bulletins.

KLIM
IN POWDER FORM

NOURISHING FOOD FOR EVERY MEAL

The freshest, sweetest separated milk your men ever drank is made by whipping Klim into water. It takes but a moment of the cook's time and provides milk just as it was when separated a few hours after the milking. The men will enjoy it at every meal. The cook will welcome it as an aid to better cooked and baked foods. Klim provides pleasing additions to the camp menu at small cost. Easy and inexpensive to ship because it is in powder form. One 10-lb. tin of Klim contains as much milk food as forty 1-lb. tins of canned milk.

ASSISTANCE TO GOLD MINING.

The British Government is said to have appointed a Royal Commission to report on "The War's Effect on Gold Production in the British Empire." The commission is composed of four members with Lord Inchcape as its chairman, while Mr. William Frecheville is its technical advisor. Dr. W. G. Miller represents Canada.

Mr. Frecheville is one of the foremost mining engineers in London, and at the same time one of Great Britain's most public spirited citizens. A few years ago he gave up a large and lucrative private practice to assume the onerous duties of Dean of the Mining School in the Imperial College of Science in order to put that school on a higher educational plane, and assist in educating the young engineers of the Mother Country. The people of Canada may feel the utmost confidence in leaving their case for any possible assistance to gold mining in Mr. Frecheville's hands. He knows the gold mining industry of Canada thoroughly. He has visited the country himself on several occasions, and he is also one of the directors of the Anglo-French Exploration Company, which has an interest in the Hollinger and other mines in the country, and whose representative, Mr. J. B. Tyrrell, keeps him, along with the other directors of the company, thoroughly informed on our mining situation.

DEVELOPMENT OF MINERAL RESOURCES WILL NOW BE SPEEDED UP.

Those who are engaged in developing our mineral resources have busy days ahead of them. The rapid development of our mineral deposits is now necessary and will soon be possible. The world is crying for our raw materials. Canada's mines have done well during the war in spite of shortage of labor and high cost of supplies, and they will soon be in position to greatly increase production and add materially to the wealth of the nation.

During 1917 Canada produced minerals and metals valued at \$192,982,837. This great production was obtained under conditions that made operation very difficult. Many of our best miners have been fighting in France. There has been a shortage of machinery and supplies. The demand for raw materials is now greater than ever before, and with men, machinery and supplies available our production is bound to increase.

The effect of the coming of peace has already been interpreted by the stock exchanges. Munitions manufacture must now give way to the production of basic necessities. Construction and the repairing of badly worn equipment will call for enormous quantities of minerals and metals. With more men and machinery available, and with less costly supplies, the Canadian mining and metallurgical industries must grow rapidly in the next few years.

While the consumption of the common metals, iron, lead and zinc, is sure to be large for reconstruction purposes, as it has for munitions manufacture, there also will be great demand for the precious metals. Our gold mining industry, which has stood the severe test of war in a very remarkable way, is certain to take giant steps forward in the coming year. That our gold mining companies have been able to operate at all during the past two years has been surprising to many of us. An industry which has lived through such trying times cannot but develop very rapidly now.

Silver has fortunately commanded a price which made possible the profitable operation of the Cobalt silver mines in spite of high costs. The demand for silver continues good and it is unlikely that silver will be cheap again for many years. The Cobalt silver mines have never had large reserves developed, but they continue to show up well on development. Much of the ore has been mined, but the end of silver mining at Cobalt is still far away.

The Sudbury nickel-copper mines and smelters have been very busy during the war and will continue so. Nickel refining on a large scale in Canada has just begun. Nickel, so useful in the manufacture of munitions, will be in great demand for the manufacture of nickel steel for peaceful trades. Copper also will be needed and there is a great scarcity of platinum and palladium which occur in the Sudbury nickel-copper ores.

It is reasonable to expect that the refinery at Port Colborne will soon be enlarged so that all the matte

produced by the International Nickel Co. will be refined in Canada. We should also look forward to the recovery in Canada of all the precious metals which are mined with the nickel. There is also now under construction a refinery for the British America Nickel Company which is developing the Murray mine.

Northern Manitoba has during the war become an important producer of copper. Under serious handicaps several thousand tons of rich ore has been mined and shipped from Schist Lake. A large deposit of sulphide ore at Flin Flon Lake has been discovered and explored by drilling. Several gold deposits have been found. Northern Manitoba is sure to attract much attention from mining men now that peace is near.

In Quebec great changes have been brought about in the asbestos industry by the war. Formerly much of the asbestos went to Europe, and the production naturally fell off when the war began. A larger market in the United States has been developed and larger quantities than ever will be used both in the United States and Europe.

In the Prairie Provinces the coal shortage has resulted in greater production and consumption of Canadian coal. The immediate result has been greater activity at the Alberta coal mines. The market for Alberta coal has been considerably enlarged and the coal mining companies will be permanently benefitted by the greater utilization of local fuel.

In British Columbia gold mining has naturally suffered severely. This industry will be greatly benefitted by the return of peace conditions. The war has hastened the establishment of zinc and copper refineries. The search for "war minerals" has resulted in the direction of attention to many idle properties. Greater activity in prospecting and development of the mineral areas of British Columbia is confidently expected.

In Nova Scotia the coal mines have been handicapped by shortage of men and inadequate transportation. With men and ships available the Nova Scotia mines will greatly increase production. The great activity in the iron and steel industry will continue war or peace. This will require larger supplies of ore, fuel and fluxes. Mining in Nova Scotia and Newfoundland must therefore be increased to supply the needs of the province. Mining of coal to supply the Maritime Provinces, the Atlantic States and for coaling ships will also be necessary.

THE EMPIRE'S MINERAL RESOURCES.

The Imperial Institute, in continuation of its publications with reference to the Mineral Resources of the Empire, has now issued a map with diagrams indicating the sources within the Empire of the chief metals of commercial importance. The outline map shows the occurrence in each British country of important metallic ores, and also the existence of deposits at present unworked. The diagrams attached to the map give for 1915 the production of each country as well as the total British output and the world's output of each important metal or ore.

Among the striking features disclosed are that in the case of gold more than half the total production is within the Empire, the principal producer being South Africa. With silver the British proportion is rather less than one-fifth, the principal producer being Canada. In the cases of manganese, chromium, tin and molybdenum the

British proportion is near one-half. It is remarkable that there appears to be scarcely any production of the valuable metals mercury and platinum within the Empire, so that we are almost entirely dependent on foreign countries for supplies. In the case of nickel, and cobalt Canada produces most of the world's supply.

This publication should prove of great general interest apart from its importance to those specially concerned in mining operations and should be of considerable value for educational purposes.

The map, which is folded and mounted on linen, has been prepared with the advice of the Mineral Resources Committee of the Imperial Institute, of which the late Lord Rhondda was chairman at the time of his death. The map with diagrams has been placed on sale at a price of 5s. 6d. post free.

The data used are for 1915. At present Canada is producing much larger quantities of molybdenite and chromite than in 1915. Canada also produces a very considerable quantity of platinum and palladium.

CORRESPONDENCE

Proposed Changes in Mining Act.

To the Editor of the CANADIAN MINING JOURNAL:

Sir,—I noticed in your publication of October 15th, a statement by Mr. Godson, that there is a growing sentiment throughout the country in favor of the elimination of the existing system of issuing Crown Grants of mineral claims to parties who comply with the requirements as to development, etc., and the inauguration in its stead, of a system whereunder the government would retain perpetual ownership of their mineral lands, only granting leaseholds on liberal terms, with a penalty of forfeiture if the terms are not complied with.

In the spring of 1918, at the mining convention, held in this city, a number of resolutions suggesting changes in the Mining Act were unanimously passed by a large number of mining engineers and prospectors who attended the convention. One of the most important changes suggested as being beneficial to this and other mining divisions, was exactly the opposite to Mr. Godson's statement, i.e.—to abandon the lease system and grant patents instead, for the following reasons. "Uncertainty of tenure of leases and Licenses of Occupation, subject to regulations which may be altered from time to time by Orders-in-Council, or may be cancelled or revoked, render them too hazardous a proposition for capital to entertain, and the mining industry is entirely dependent on securing capital for its development."

It is further the opinion of this Board, that the above reasons are amply justified by the many years experience that the members of the mining committee have had in this district, and other parts of the provinces. For example—a mining company might go to very heavy expense in development, mines buildings, machinery, etc., and if a term of lean years in the market came along, they would be forced, under the lease system, to operate at a very heavy loss or the lease would be automatically cancelled and many thousands of dollars of development and mine equipment would be completely thrown away, or at best the mine equipment would have to be scrapped and sold at a great loss.

It is true that the lease system is applied to many iron mines in the United States after Patents to owners are issued; but the length of lease invariably extends over a very considerable period of time ranging from 25 to 50 years, also the minimum shipments are made so low that a mining company could tide over several lean years on paying their advance royalties and mining the ores when the market improved.

But the important point of all is that it would absolutely discourage exploration. What explorer could afford to

take out a lease from the government and start mining, or fulfil the requirements of a government lease while endeavoring to make a sale of his claims? It is a hard enough struggle under normal conditions to fulfil the requirements of the Ontario Act and secure a Patent. Many claims revert to the Crown owing to the inability to comply with these conditions, as the claim is automatically cancelled, even if the full three years assessment work has been complied with, if the prospector has been unable to raise the necessary cash to make a survey and pay the required government price for the land. It frequently happens that even after securing his Patent, he is forced to carry these lands for years before making a sale. To do this under a lease and forfeiture system would be simply impossible.

In British Columbia, the terms and conditions of working clauses to be complied with are much easier, and we must not forget that the development of the entire mining district is dependent on the explorer who works faithfully season after season, only too frequently to see his hopes of a title depart from him. It must be remembered that if it rested with the average mining company to employ the great number of explorers who spend their lives searching over our great northern territory, the amount of work done along that line would be tremendously lessened, also that the mining company is just as dependent on the labors of the explorer as the explorer, on the capital of the mining company.

In the opinion of this Board, nothing would be more detrimental to the development of the mining interests of this country than the passing of such a measure.

Yours, etc.,

Jos. Z. FINZEL,

Secretary Port Arthur Board of Trade.

Port Arthur, Nov. 6th, 1918.

PROPOSED AMENDMENTS TO THE MINING ACT.

Following is a copy of proposed amendments passed at the convention:

1. That the Recorder of a Mining Division have the power to issue a Special Renewal License. (Under the present terms of the Act, considerable delay occurs by having to submit the matter to the commissioner, which would be obviated by vesting that power with the Recorder. This delay is at a season of the year that can be ill afforded by the prospector.)
2. That Orders-in-Council affecting mining claims and regulations under the Mining Act be published in at least one newspaper in the district affected, in order to inform prospectors and others interested. (Unless the prospector visit the Recorder's office he has no opportunity of becoming advised of such Orders-in-Council and this may result in undue hardship.)
3. That Patents be issued for claims or parts of claims covered by water, where it can be shown that the granting of such Patent will not interfere with navigation.
4. That in Crown Forest Reserves and Timber Berths where prospecting is permitted, Patents instead of leases be granted for mining locations, subject to such reservations as may be deemed advisable. (The uncertainty of tenure of Leases and Licenses of Occupation, the fact that they are subject to regulations which may be altered from time to time by Orders-in-Council, or may be cancelled or revoked, render them too hazardous a proposition for capital to entertain, and the mining industry is entirely dependent on securing capital for its development.)
5. That the Assessment Work consist of \$100 worth of actual mining work per 40 acre location per year, for a period of three years, when a Patent shall issue at the usual price per acre.
6. That the Assessment Work may include cost of survey, not to exceed \$100 per location, and in the case of an iron location, may include a magnetic survey.

(The condition of the labor market, the increase in wages, cost of materials and living, which have all more than doubled since the present Act came into force, make it desirable that Assessment Work should be on a fixed basis of value and not dependent on variable factors. By including the cost of survey in the Assessment Work, the tendency would be to have this performed at an earlier period in the development of the location than obtains at present and would thus avoid many difficulties and disputes as to boundaries, besides reducing the total cost to the prospector. In case the of iron locations more practical benefit would result in many cases from a magnetic survey than any surface trenching. Under the present conditions, the total cost to the prospector of Assessment Work, Survey, Purchase Price, License and Recording, is a minimum of \$70 per acre, which is prohibitive on all but bonanza ores. The proposed amendments would reduce this to about \$10 per acre which is reasonably high enough considering the hazardous nature of mining operations.)

7. Sub-Clause to (7) Sect. 78. That in the case of claims taken up for iron and iron pyrites, the Assessment Work may be applied on one or more of 10 contiguous claims. (Prospecting for iron and iron pyrites involves exploratory work distributed over large areas of promising formation, in which a concentration of merchantable ore may only be expected under favorable conditions. In most cases these can only be determined by extensive diamond drilling, involving an outlay that should be applicable as Assessment Work over a larger number of contiguous claims than obtains with other ores.)

8. That the unorganized portion of the Fort Frances Mining Division be administered by the Mining Recorder at Port Arthur. (At present the Mining Recorder's office at Fort Frances is closed. This necessitates the forwarding of various documents to Toronto, causing delay and inconvenience, which could be obviated by administering the Division from Port Arthur.)

[OBITUARY.

C. E. Watson, Geo. Randolph, Jas. Alexander and A. B. Clabon.

Two prominent Canadian mining men were lost on Friday, the 25th October, when the Str. "Princess Sophia" foundered in Lynn Canal, while on her way south. They were Messrs. C. E. Watson and G. O. Randolph, the former being general manager of the Mining Corporation of Canada, and the latter a Cobalt mining engineer. They came to British Columbia in September and, after an inspection, acquired control of the Woolsey Silver Claims, situated on Silver Creek, near Revelstoke, B.C. This business completed they proceeded to the Atlin District to examine the Engineer Free Milling Gold property, situated on Taku Arm of Tagish Lake, and owned by Captain James Alexander. It was generally understood that their intention was to endeavor to effect an agreement with Capt. Alexander for the purchase of his mine, providing their observations satisfied them as to its possibilities. They were on their way back, accompanied by Capt. Alexander and Mrs. Alexander, when disaster overcame the vessel on which they had taken passage and all met death in the icy waters of the northern coast. Mining men are referring to the tragic coincidence in that so many of the principals in the Woolsey property deal should have been so suddenly carried off, Mr. A. B. Clabon, through whom much of the preliminary negotiations were conducted, having been killed only a short time ago by falling over a precipice at Silver Creek. Capt. Alexander also had many friends in mining circles in British Columbia. Capt. Alexander valued the Engineer Mine at \$2,000,000.

Possibilities of European Immigration After the War

By F. W. GRAY

A year or more ago there appeared in various Canadian newspapers a suggestion that Canadians should prepare for a renewal of the tide of European immigration which has been interrupted by the war. It was intimated that the cost of the war would result in such increase of taxation in European countries as would drive the peasantry and artisans to seek less onerous conditions of living and the greater political freedom of the United States and Canada. The preponderating movement of population forecasted was from Europe westward, or an accelerated continuation of that great migration which was a distinguishing characteristic of the Nineteenth Century, and out of which have arisen forces that are profoundly influencing current events. Is this forecast a correct one? There have been significant occurrences within the past few months which would indicate that it is not. The statement has been so often made that the present war is a conflict of two ideals, a conflict between autocracy and democracy, that the statement has become hackneyed and outworn, maybe, and as a writer in the October "Atlantic" states, "The original watchwords of the conflict are in danger of losing their potency as incentives after years of conflict"—but they are none the less true.

To-day we are justified in believing that the triumph of democracy is imminent, but few have realized how tremendous and world shaking are the events which will follow the actual consummation of the triumph. They may be such as even to eclipse the preliminary cataclysm and in countries such as compose the Teutonic League the birth-pangs of rule by the people through truly representative institutions may be as terrible as those which are at the present time agonizing the peoples of Russia. For, to quote again from the writer just mentioned, "When the end shall come, it will be in reality a great beginning."

That may well be, but nevertheless, nothing is more certain than the speedy replacement in Europe of all forms of autocracy and feudal survivals by representative parliamentary governments, accompanied or not—and this is really not important—by the forms of limited monarchy. While it may be hoped and prayed that Europe may be spared the extravagances and wickedness of Bolshevism, and the absurd ideas concerning property which this particular form of lunacy is attempting to propagate, it may be anticipated that the large estates of the Prussian and Magyar Junkers will be divided up amongst the peasantry, that conscription for military purposes will disappear in the consummation of a League of Nations, and that the vote will really mean something to those European peoples to whom as yet it has been nothing but a mocking of their legitimate aspirations.

All these things would seem to be the reasonable accompaniments of truly triumphant democracy, and if, and when they come to pass will not Europe be as good a country to live in as North America? And will not the main incentives to emigration from Europe have largely disappeared, at least so far as the undeveloped countries of South-Eastern Europe are concerned? This reasoning may not hold good in the case of Italy and some other countries where emigration has been forced by actual surplus population, and the lack of the basic minerals, in particular by the lack of coal, but for Russia and Siberia, for the Balkans, Poland, Hungary and Rumania, it will most certainly hold good.

There are many millions in North America who were born in the belligerent countries of Europe, and their homes, their relatives and friends have been involved in the wastage of war. For years some of these people have heard nothing of their own people, and curiosity alone,

not to mention stronger impulses will draw them to the land of their birth so soon as ocean travel on a normal scale becomes possible and permissible. The alien enemies among these present residents of North America have in most cases been enabled to earn large wages, but they have been precluded from sending to Europe the remittances that they were accustomed to send before the war. Enquiry from the large steamship companies will probably disclose the fact that steamer tickets have already been spoken for by thousands of natives of Europe now in North America who for one reason or another wish to revisit the scenes of their youth, or what remains of them. The money these people have is currency which has suffered no depreciation in value, nor is likely to, and it is evident that Europe, purged of its militaristic wrongs and restored to the rule of the people, with years of assured peace ahead, will offer many attractions to the returned emigrant with good money in his pocket.

The great wastage of life caused by the war must also exercise a deterrent effect on emigration from Europe, at least for a time, but probably this will be one of the least important of the factors in the long run.

Summarising the foregoing possibilities, does it not seem that there is a fair probability that the tide of migration may for a period set eastwards, from North America to Europe? That is to say so far as the countries are concerned with which we are to-day at war.

But when one comes to consider the question of British emigration, a different aspect is presented.

The war has unified and compacted the British Empire in a wonderful manner. The Australian has met, and in many cases married, his English cousin; the Canadian has visited and been joyfully received by his relatives in Scotland, maybe. The average Englishman whose foreign travel was limited to a Cook's tour to Switzerland has seen the Pyramids and travelled the Euphrates from the Persian Gulf to ancient Bagdad. No more can the present generation of the British be regarded as stay-at-homes, and the vision of the British people to-day in every place where the flag floats,—and they were never so many nor so scattered—is as wide and as keenly adventurous as it was in the heyday of the Elizabethan age. Many hundred of thousands of British young men, when demobilization takes place, will once again tread the familiar decks of a transport, her camouflage changed for peace-paint, bound for Canada, Australia, New Zealand, for augmented British Africa, and for the thousand and one places where our soldiers will resume the work of peace times. The complexities of the interchange of population which will take place between the British Isles and the rest of the Empire cannot be foreseen, or even guessed at, but there can be little doubt that here in Canada we shall receive an influx of British immigrants of large proportions.

If then there should occur simultaneously an efflux of the more distinctly "foreign" nationalities from Canada and the United States and an influx of British born, will it not radically, and permanently maybe, change the labor situation, and have far-reaching effects on rates of wages, hours of labor and labor politics generally? It would appear quite probable.

The effect on the mining industry will be very considerable. In the past the mining industry has depended very largely for labor supply on the newly arrived European immigrant, particularly for the more arduous and less highly paid occupations. This is probably more true of the great mining centres of the United States than it is of Canada, but we also were heading in the same direction before the war.

The British born immigrant will not adapt himself to the conditions of a common laborer, nor will he accept the conditions of living and the rate and hours of wages which have been common among "foreign" labor in mining camps—or at least were common before the war. It is not necessary to point out the changes in mine operation and in the costs of mining which must follow a reversal of labor supply such as is herein indicated. In short, common labor is to-day decidedly scarce, but it would look as if it were going to be much scarcer after peace has been arranged and demobilization has taken place.

It may be anticipated that the necessity will bring forward some remedies, and one direction in which advances may be expected is a more extended use of mechanical appliances in mining operations. Hard manual labor will in the future be much more at a discount than it is to-day, and if men can achieve results by the substitution of machinery is it not progress? Mine managers and the directors of large mining operations will be well advised to investigate every possible method of substituting mechanical devices for manual labor. It is not altogether that **cheap** manual labor is a disappearing thing. It is the actual labor supply itself that is diminishing and promises still more to diminish.

The effect of after-war conditions on coal mining in Canada would seem to be the most important of all.

Coal, as the world is now realizing, is the basic factor in industry and civilization. Shortage of coal supply, or excessively costly coal, will throttle and depress all other industry. As everybody knows, the man-power at Canadian collieries is to-day so reduced that proper outputs are not possible. But what is more serious, there appears to be no source from which the man power at the coal mines can be replenished, either during the war, or after. Only a small proportion of those miners who went to the front will return to work in the collieries. A great many are dead, many others are so wounded that they will not be able to take up coal mining again, but a far greater number will seek other avenues of employment. Notwithstanding the short hours and the comparatively large wages earned by underground workers, it is not popular employment, nor is it employment that is being followed by the sons of miners. Canada offers too many varieties of endeavor to favor the formation of a mining class—almost a caste—such as is to be found in Great Britain and in the coal fields of Europe. It has for many years been increasingly evident in Nova Scotia that the only source of labor supply for the collieries is Europe, and if that is cut off, production must decline.

Apart from the suicidal policy of curtailing coal production in war times, this feature of the Nova Scotian coal industry is one which would have advised the retention of the coal-miners in the industry. Fewer more flagrant examples of dissipation of war effort have occurred than the hand-picked enlistment of Nova Scotian miners, but the consequences of the mistake in recruiting which occurred in Nova Scotia will extend far beyond the period of the war, and will for years to come be a deterrent to the progress of the Province. No reflection is here intended upon the miners, hundreds of whom have died for their country. Braver men never stood in shoe leather than the colliers of Nova Scotia, but they would have been of far more service to the cause had those who directed the affairs of Canada counselled and allowed them to remain at home and dig coal.

To sum up the foregoing; if our reasoning is approximately correct, it would seem as if the after war possibilities in Canada will include a decided shortage of "common" or "foreign" labor, an influx of British born to whom laboring work will not appeal, accompanied by a continuation of a demand for coal which will be greater than the available labor supply will make it possible to

produce. Prophecy is not a pursuit to be recommended or indulged in in times when almost every prediction made has been falsified by events, but intelligent anticipation of the future may prove of profit if it enables us to prepare solutions of the problems of the future. Students of reconstruction after the war are invited to give consideration to the possibilities mentioned above, and some actual enquiry of sources which are in touch with immigration matters might prove useful to those who employ large bodies of men in mining operations.

BRITISH COLUMBIA MINES DEPARTMENT WILL PROSPECT CLAIMS.

The Snowstorm Group, which comprises five highly mineralized copper-silver-gold claims situated in Highland Valley, Yale District, will be prospected by the Provincial Department of Mines by diamond drilling under the terms of the Mineral Survey and Development Act.

Announcement to this effect has been made by Hon. Wm. Sloan, Minister of Mines, and tenders are being invited for 10,000 lineal feet of drilling, more or less, thus allowing ample margin for the definite proving, or otherwise, of the ore body which, it is generally believed, exists.

Before deciding on this step Mr. Sloan has had the property inspected and reported upon by the best engineering authority. Among those who have expressed the opinion that the Snowstorm Group is a good prospect and likely to prove a valuable asset to the Province, with further development are R. W. Thomson and P. B. Freeland, resident engineers with headquarters respectively at Kamloops and Grand Forks. Their views are supported by Mr. Wm. Brewer, now resident engineer, Nanaimo, B.C., whose report on this property appears in the 1915 report of the British Columbia Minister of Mines and the late Dr. C. W. Drysdale, formerly of the Geological Survey Branch, Ottawa, who did considerable survey work in this Province, and who held a very favorable opinion of the mineral zone in which the claims in question are situated.

Mr. Brewer, in 1915, states that, after an examination of the Highland Valley Camp, his conclusions were that "while there is considerable tonnage of high grade bornite and chalcocite copper ore on several of the mineral claims, yet that the future growth and prosperity of the camp will eventually centre around the apparently extensive bodies of low grade copper ore. To systematically and thoroughly prospect and develop these deposits, diamond-drill boring would appear to offer more advantages than the slower and more expensive method of opening up the mineral-bearing zones by working openings."

It is Mr. Sloan's hope that the diamond drill which he has authorized will result in proving a large and rich mineral area which has been lying idle for years, and that the direct outcome will be an important addition to the shipping mines of British Columbia.

Asked whether any action had been taken by the Department of Mines towards the diamond drilling of any of the iron ore deposits of the Province, Mr. Sloan said that he expected to be in a position shortly to call for tenders for the drilling of one or more such properties.

The West Kootenay Power & Light Co., of British Columbia, has ordered 800,000 lb. of copper cable and other material from manufacturers in Hamilton, Ont. This is sufficient for 300 miles of line and will be used chiefly in extending the circuit from Greenwood, B.C., to Copper Mountain, to furnish power for the operations of the B. C. Copper Mining Co. at that point. This work, it is stated, will be completed by July, 1919.

THE ROMANCE OF THE YUKON.

The romance of the Yukon was never better illustrated than in the career of Mr. William Scouse, one of the 343 lost on the morning of the 25th of October, when the Str. "Princess Sophia," one of the vessels of the Canadian Pacific Steamship Co., having struck a reef in Lynn Canal while en route south, sank and carried all her passengers and crew to an untimely end. Mr. Scouse was one of the real "Sourdoughs," whose ranks are fast thinning. It was he who raised the first bucket of "pay" on the famous Eldorado Creek.

It was in February, 1896, before the days when the finding of the gold made the Klondyke a household word throughout America, that four young men of Nanaimo, B.C., impelled by a spirit of adventure, decided to set out on a trip through the Northland. They were William Scouse, William Sloan, Jack Wilkinson, known by the sobriquet of "Big Jack" to the miners of Nanaimo, and Thomas Flack.

"Our idea was to prospect the country," explained Mr. Sloan in recalling the circumstances of the expedition, "but I think that what was even more prominently before our eyes was that we would see the vast and mysterious northern lands of which so little was known in those days."

The little party took passage by the old Str. "Willapa," and outfitted at Juneau from where they hit the trail into the interior, passing over the Chilcoot Pass, where a few years later, when the historic trek to the Klondyke started so many were to give up their lives, into the Stewart River Country.

For the greater part of the summer they prospected without success. Running short of supplies they decided to work into the Yukon, where, just at that time, excitement ran high over the discovery of rich deposits on Bonanza Creek. They reached this creek too late—all the ground had been staked. This turned them aside to Whipple Creek, later to be known the world over as the Eldorado. On September 7th, 1896, Mr. Scouse staked No. 14 and Mr. Sloan No. 15, Eldorado, while Mr. Wilkinson recorded No. 25, Adams Creek; Mr. Flack No. 32, Bonanza; and others were staked on Hunker Creek.

When the four left Nanaimo it was understood that they were equal partners in anything that was found, and to this agreement they held throughout. Their joint efforts were generously rewarded, each leaving the Yukon with a substantial fortune.

Having made their records, it was decided that the Eldorado prospects should first be developed and a small but comfortable cabin was built close to the claims. The lumber for the cabin's floor was whipsawed, Messrs. Wilkinson and Sloan doing the whipsawing which was required for all operations at that time. Mr. Sloan, in this connection, remembers that, with "Big Jack" on one end of the saw he had to "go some."

In discussing these early days, Mr. Sloan says, that the reports that his partner, the late Mr. Scouse, hoisted the first "pay" dirt on the Eldorado is quite correct. He recollects the circumstances quite clearly. "I was the boss carpenter," Mr. Sloan recalled with a smile, "and thus it fell to my lot to make the first windlass and bucket for the prospecting of the first shaft on the Creek. There was some argument as to the required size of the drum and the bucket. When they had been constructed I gave them their first trial and raised the first dirt, which then was without pay, on the Eldorado."

While Sloan and Flack were hauling supplies to their claims from the Klondyke River, word reached them that the first "pay" dirt had been raised on their property.

At the time they were on their way to the Creek and, meeting Alex. Orr, a miner with claims above theirs on the Eldorado, he told them that Scouse and Wilkinson had reached bed-rock and that Scouse, with Wilkinson in the shaft, had brought the first gold to the surface, there being \$57 to the bucket.

In sinking the shaft the character of the ground was watched with interest and carefully prospected, but the results were disappointing all the way down. When the gravel was thawed out it was found, Mr. Sloan explains, to be a loose light wash. About 20 feet down a pile of drift wood was encountered and it was not until after this had been passed that hard tight wash was reached, this being only a short distance from bed-rock. While there was exceptionally good pay at bed-rock on this shaft the main pay was found in cross-cutting to a second shaft. Mr. Sloan states that before the claims were thus proved the partnership was "stony broke" so that the day that the first gold was hoisted saw them step from a condition of poverty to one of comparative affluence.

While luck was with the Nanaimo men, other miners were not so favored by the Goddess of Chance. It was the old story of a thousand gold fields. Some made good and others failed. Some were brought within easy reach of fortunes only to be turned aside by the whims of chance. This was the case, Mr. Sloan narrated, with Jack Kool and French Pete, partners in the great game of gold hunting. They could have staked Claims 16 and 17, next to the Scouse-Sloan, et al, combination, the former of which turned out to be the richest of the Yukon. They, however, did not like the looks of the Creek at that point and left to take up Nos. 26 and 27, Adams Creek. The latter did not pan out and later on the two returned and worked for wages for the Nanaimo partnership. No. 16, Eldorado was staked later by Con Van Alsteine, who had been prospecting near Messrs. Scouse, Flack, Wilkinson and Sloan in the Stewart River Country that summer. Van Alsteine traded No. 16 to Mr. T. S. Lippy, who had staked No. 37 on the same creek, and it was thus that Mr. Lippy came to be possessed of the wealth of one of the most productive pieces of ground in the Yukon. Van Alsteine, it was recalled by Mr. Sloan, sold No. 37 for a good figure. Going to New York he lost his money in a matrimonial venture, his bride, to whom he had entrusted his "roll" deserting him as they boarded a steamer which was to take them to Europe on a honeymoon.

A human interest touch is given this story of the Yukon by the fact that the four Nanaimo men, when they separated after their success, agreed that on the twenty-fifth anniversary of the Eldorado strike they would meet again, all being alive, to celebrate and to live again in reminiscence the days of their pioneering. The pact provided that they would come together on that date no matter how far anyone of the four might have to travel. Mr. Scouse's death makes the first break in the partnership.

"The last time I saw Scouse he referred to our reunion," observed Mr. Sloan, "Now he is gone. He was a man of the utmost integrity, a genial companion and a thorough gentleman in every respect. We four worked harmoniously together for some years; there was never the scratch of a pen in our dealings together and when we finally dissolved the partnership and dispersed, there remained an enduring friendship which has continued through the years. I know the other members of the partnership, Messrs. Flack and Wilkinson, will feel keenly, as I do, the untimely and sad fate of our old friend, William Scouse."

Mr. Wilkinson is now retired and living near New-castle-on-Tyne and Mr. Flack at present is living in Chicago, Ill.

MINERS' STRIKE CAUSES LOWER COAL OUTPUT.

The total production of coal for the Province of British Columbia for the month of September was 164,460 tons, or a decrease of 75,777 tons as compared to the August output. This is the first month of this year that has shown a decline, and it is to be explained to a large extent by the month's strike of the miners of the Fernie and Michel Collieries in the Crow's Nest Pass Field. This is responsible for a loss of at least 50,000 tons, the August return from these mines being 78,971 tons as against 17,784 tons for the month under review. There also should be taken into consideration Labor Day, five Sundays, and a thirty-day month, as well as the Nanaimo accident, in which some sixteen miners were lost when the hoisting cable in No. 1 Shaft, Protection, Western Fuel Co., broke and let a descending cage fall.

The tonnages produced by the various districts follows:

	Tons
Vancouver Island.....	131,695
Crows' Nest Pass.....	17,784
Nicola Princeton.....	14,831
Northern Area (the first record from this field)	150

164,460

The tonnage produced by the various mining companies follows:

Vancouver Island.

	Tons
Canadian Collieries (D), Ltd.....	67,156
Canadian Western Fuel Co.....	50,858
Pacific Coast Coal Mines.....	5,581
B. C. Coal Mining Co. (Jingle Pot).....	3,273
Granby Mining & Smelting Co.....	2,327
Nanoose Collieries.....	2,500

131,695

Crow's Nest Pass Field.

	Tons
Crow's Nest Pass Coal Colliery:	
Coal Creek Colliery.....	3,224
Michel Colliery.....	1,399
Corbin Coal and Coke Co.....	13,161

17,784

Nicola-Princeton Field.

	Tons
Middlesboro Collieries (Merritt, B.C.).....	8,327
Fleming Coal Co. (Merritt, B.C.).....	2,743
Coalmont Colliery (Coalmont, B.C.).....	748
Princeton Colliery (Princeton, B.C.).....	3,013

14,831

For the purpose of facilitating the equal distribution of anthracite coal in Canada during the winter a further Order-in-Council has been passed by the Dominion Government at the instance of Fuel Controller C. A. Magrath. The regulations contained in this order are designed to prevent disproportionate deliveries of anthracite to large consumers at times when the householder cannot be supplied, the fuel controller being given the right to prohibit entirely, or to limit in any manner he may deem advisable, the use of anthracite coal in any building. This does not apply to private houses using less than 40 tons of coal annually. This law will be enforced through the fuel administrators of the various districts or, in the event of there being no such official, direct from Ottawa by the fuel controller. Infractions of the ruling may be punished by heavy penalties.

SOME SAMPLES OF WRECKAGE IN THE COAL MINING DISTRICTS.

DRILLING FOR COAL ON EAST COAST, VANCOUVER ISLAND.

New coal mine development of an important character has commenced on Vancouver Island, British Columbia. The measures known to exist on the East Coast near the town of Chemainus are being explored by means of diamond drill and those in the best position to hazard a forecast do not hesitate to predict that the results will be satisfactory as far as the quality and quantity of the coal, the existence of which is to be definitely established, are concerned. Mr. H. W. Treat, of Seattle, Wn., is the party best known in connection with these steps to develop this latent natural resource, but, according to newspaper statements and common report, he has behind him the capital of the Samuel Hill interests of the United States. If this is so it is generally believed that the coal industry of this section is likely, in the near future, to experience a very material growth.

The drills in question are being sunk near the foreshore at Chemainus, at which point Mr. Treat has secured some provincial leases and options on some Crown Granted Lands. Incidentally Mr. Treat, whose energies have been devoted to the Island for some months, has obtained options on coal bearing lands of the district. But in this particular section the drilling is being pushed forward expeditiously under the supervision of Mr. John Hamilton, who had charge of similar work for the Granby Consolidated Mining & Smelting Company, when that company was opening its coal mines at Cassidy's, Vancouver Island. The prospects for the establishment of another large colliery in this part of British Columbia, therefore, are bright and residents are looking forward to it with gratification.

An account of what led up to the present situation is interesting. When the E. & N. Railway Company obtained its land grant as a subsidy for the construction of the road the Dominion Government, besides giving it all the mineral rights within the limits of the belt with the exception of that of gold and silver, also gave it the right to mine "in and under the seas." The Government, however, was doubtful, apparently, as to whether it had the power to extend any such exclusive privilege to any company or individual. For that reason the qualification was inserted that this applied only if Parliament had the authority necessary under the British North America Act. This was the position when Mr. Treat and his associates cast their eyes on the East coast foreshores of Vancouver Island and visualized the immense deposits of coal which lay beneath the protected waters of its bays and estuaries. With the demand for coal the world over increasing and the price soaring it was decided that the point as to whether these rights were open or whether they were the exclusive property of the E. & N. Railway company should be brought to an issue. As was anticipated, no doubt, the plans of Mr. Treat had not proceeded far before legal proceedings were instituted by the company, and since then, up to a short time ago, the matter had been before the courts of the land. The result, as may be judged by the fact that development operations are proceeding, was that the position that the E. & N. Railway Company cannot claim exclusive foreshore privileges has been upheld, although, it is not improbable that the litigation will be carried as far as the Privy Council as the dispute is one of the highest importance, involving title, if the opinion of geologists is to be given any credence, to considerable coal deposits.

It is possible to get some idea of the coal wealth of the foreshores of the East coast of Vancouver Island, from Cowichan Bay to Nanaimo, a distance of between forty and fifty miles, and even further north, by contemplating the property of the Canadian Western Fuel Company at Nanaimo and its production. This company's

chief output comes from No. 1 mine, and its workings are under water. It acquired title to this, before the railway company got its land grant, from the Hudson's Bay Company, which, of course, was the pioneer concern in the opening up of Western Canada, as it was in the exploitation of the natural wealth of the whole of the Dominion of Canada.

GOLD PRODUCING POSSIBILITIES OF THE CARIBOO DISTRICT.

The gold producing possibilities of the famous Cariboo District of British Columbia, which already has to its credit a gold output aggregating \$65,000,000, is the subject of an interesting report by Mr. B. B. McKay, of the British Columbia Branch of the Dominion Geological Survey. Mr. McKay, who has spent considerable of the summer in that district, states that, notwithstanding the heavy increase in the cost of mining operations and the comparatively low, or standard price of gold, production is going on steadily. He predicts that in many parts of the country there will be much gold recovered, but does not look for this development until after the war, when more labor becomes available. With men looking for employment, and equipment cheaper and more readily secured, he declares that the ground will be made to yield richly. The use of hydraulicking, dredging, drag-line scraping, etc., makes this possible, where, in the old days, it would have been considered impracticable. Lack of transportation facilities, he says, is holding back development, there being areas in the vicinity of Keithley and Harvey Creeks which lack even the roughest of wagon roads.

The installation of the new plant in preparation for winter operations is occupying the attention of the management of the Delta Copper Co., Ltd. This property is situated on Rocher deBoule Mountain, Skeena District. Latest reports are to the effect that on the east end of the claims, and at an elevation of 6,250 feet a body of ore already is blocked out on the upper vein.

Boring for water in a Canadian camp in France.

A. G. LANGLEY WILL REPRESENT BRITISH COLUMBIA IN SMELTER INQUIRY.

Mr. A. G. Langley, Provincial Resident Mining Engineer, with headquarters at Revelstoke, B.C., has been appointed to represent the Provincial Government at the pending inquiry into the justice or injustice of the rates charged by the Consolidated Mining & Smelting Co. of Canada, for the treatment of custom ores at the Trail (B.C.) Smeltery. This appointment is the result of a debate which took place in the British Columbia Legislature at its last session, the matter being introduced by members from the Boundary District, in which section are situated the majority of the shipping mines the owners of which are dissatisfied with conditions. The debate led to the passage of a resolution introduced by Hon. Wm. Sloan, Minister of Mines, to the effect that the Provincial Government should be represented at the proposed investigation and that, if the evidence adduced indicated that the mine operators were being unjustly treated, the whole question would be made the subject of a searching inquiry by a Royal Commission appointed by the Government of British Columbia and empowered to submit recommendations for the removal of the cause of protest and for the permanent and satisfactory adjustment of the smelter question in the Province. Mr. Langley therefore will attend each of the sessions of the Committee which now has the matter in hand, the members of which are Messrs. deLashmutter, Fowler and Anderson, and will report to the Minister of Mines. The first meeting of the Committee was to have been held on the 31st of October, at Nelson, B.C., but owing to the regulations prohibiting public gatherings of any kind, because of the prevalence of Spanish Influenza, an indefinite postponement has been announced.

ANOTHER WAGE INCREASE FOR COAL MINERS.

Another wage increase has been granted the coal miners of Vancouver Island, B.C., according to an announcement made on October 24th. The request for this advance has been before the authorities for some weeks, and it was felt that the delay in reaching a decision might have the effect of causing labor trouble of a serious character. Certainly such an outcome was threatened. The acquiescence of the government officials and of the operators, however, has resulted in quieting all murmurs of dissatisfaction. Final decision was reached at a meeting between Mr. J. Bulger, representing the Fair Wage Officer of the Dominion Government; Mr. Nichol Thompson, representing the Fuel Controller; and a number of British Columbia members of the Dominion House of Commons. The extent of the raise is 75 cents per day, and it was agreed further that a Commission consisting of the Dominion Fair Wage Officer and representatives of the men and the companies should meet once in every three months, as is done in Eastern British Columbia and Alberta, to adjust the wage scale in its relationship to the rise or fall of cost of living. The new arrangement as to wages will date from the 1st of November, and the Commission referred to will hold its first meeting in January. Another advance in the retail cost of coal in the province is certain to follow, it being state in authoritative quarters that Fuel Controller Thompson is likely to authorize the addition of fifty cents a ton to the present selling price, the change also to date from the first day of next month.

Under the terms of a recent Order-in-Council the Canadian War Trade Board is authorized to take possession and to operate for a period of five years if, necessary, any mines or properties in Canada which are producing chrome ore, or which have produced it in the past.

BORING FOR WATER IN A CANADIAN CAMP IN FRANCE.

—Canadian Official Photograph.

MANGANESE ORE ON VANCOUVER ISLAND.

In reporting on the recent manganese ore discoveries on Vancouver Island, British Columbia, Mr. Wm. M. Brewer, resident engineer with headquarters at Nanaimo, B.C., states that the mineral deposits in question are in his opinion of very considerable importance. As, however, there has been very little development done as yet, the extent and continuity of the deposits are undetermined. Samples assayed by the Provincial Bureau of Mines, it is stated, show results of percentage of manganese in the ore varying between 15.88 and 52.60 per cent with the majority of the samples showing over 40 per cent. manganese. It is impossible, he says, to form any reliable estimate of the tonnage actually in sight, but is of the opinion that the computation of Mr. G. C. Mackenzie, Western representative of the Munition Resources Commission, of 2,000 tons immediately available may be accepted. It is further stated that the deposits of manganese occur in a belt of cherty jasperised rock which is said to be continuous from Mount Sicker to the northerly end of Cowichan Lake, a distance of some forty miles, and is included in the Mount Sicker series of rock formation. Sufficient work has not been done to determine whether the deposits of manganese ore are residual or whether they occur as replacement deposits in the jasperised rock and occupy fissures in the sheared portion of the belt of rocks. The latter theory would appear, from the conditions at present shown by the shallow work that has been done, to be the most tenable, and if such prove to be the case it is reasonable to presume that the ore deposits may possibly maintain continuity to some considerable depth, as the shearing movement appears to be widespread and deep-seated.

INCREASE IN PRICE OF COAL IN BRITISH COLUMBIA

An increase of 75 cents a ton in the selling price of coal in British Columbia was authorized by Mr. Nichol Thompson, Pacific Coast representative of the Fuel Controller, on the 1st of November. Coal for domestic uses, therefore, now costs \$9.75 a ton in this province. The further advance is the direct result of the raise of 75 cents a day in the wages of the coal miners of British Columbia which was demanded by them and granted by the officials of the Fuel Control Department a couple of weeks ago.

Vancouver City proposes to appoint a Fuel Administrator under the terms of an Order-in-Council passed by the Dominion Government authorizing both Provincial and Municipal officers to work with the Fuel Controller in fixing prices, regulating distribution and in the discharge of the many other duties of the department. Up to the present the Provincial Government has not named a Fuel Controller for this section of Canada, but Mr. Thompson is acting in the interim. It will be the duty of Vancouver's representative to protect the citizens of that City against unduly high prices and, in the event of a shortage of fuel this winter, which does not seem likely to occur, to see that the available resources are fairly allocated.

CROWS' NEST PASS COAL MINES PRODUCTION INCREASING.

When the miners of the Fernie-Michel District, Crow's Nest Pass, British Columbia, went back to work on the Single Shift System, thus having gained that for which they struck for thirty or more days, it was understood that a Royal Commission was to be appointed by the Provincial Government to investigate the men's charge that a single shift was necessary "because of the dangerous condition of the mines." It is authoritatively reported that the delay in the announcement of the personnel of this Commission is due to the men having failed to nominate their representative to its counsels. The company, it is said,

has done so and the government is prepared to take action as soon as the miners are heard from. The explanation given of the delay on the miners' part is that because of the Provincial regulations prohibiting public gatherings as a step towards stamping out the epidemic of Influenza in the West, they have been unable to assemble for the purpose of selecting one of their number to take part in the investigation. Meanwhile the work at the mines is proceeding without apparent trouble and it is satisfactory to be able to report that the re-organization following their enforced idleness is practically complete and that the output from this district may be expected to approximate normal in a very short time.

It is likely that as a result of the recent miners' strike on the coal field of the Crow's Nest Pass, British Columbia, some of those who left their work will be called to the colors under the terms of the Military Service Act of British Columbia. An appeal has been entered by the military authorities against the further exemption of twenty-four employees of the Crow's Nest Pass Collieries on the ground that they have disobeyed the order made by Judge Thompson when he allowed them exemption, it being shown at that time that they were engaged in a work of national importance. This order only permits any employee to remain idle from this essential employment twenty-four working hours within any calendar month. During the strike for single shift twenty-nine working days were lost. The appeals were heard on the 13th of November.

It is announced that the Taylor Engineering Company, of Vancouver, B.C., which was constructing the road, which is designed to open up the Alice Arm Mining District of Northern British Columbia, has assigned for the benefit of its creditors. The latter, it is stated, include most of the workmen engaged on the line. They refused to continue any longer without their wages when within two days of having so far completed the road as to permit of the shipment of ore from the Dolly Varden Mine to Alice Arm Camp. The failure of the construction company, while constituting an unfortunate interruption, is not expected to hold back long the completion of the railway, and the active development of the several mining properties which it taps.

CHROME ORE ON BRIDGE RIVER, B.C.

A recent discovery of chrome ore by Frank Tracey and C. A. MacKay, assays 52 per cent. chromium oxide and a trace of platinum. This ore is the highest grade of its kind yet recorded in British Columbia. The claims are about 8 miles along the Chilcoton Trail on the Bridge River Road and 41 miles from the Pacific Great Eastern Railway.

The Pioneer Mine, Bridge River, has completed sinking a vertical shaft 300 ft. deep. Good ore showings have been revealed and the mill will be soon working to capacity.

The Lorne and Ida May Mines have been operating all summer, but very short handed, help being almost impossible to obtain.

A trail to the Henry Schwartz copper property on Gun Creek, has been partially completed by the Provincial Government. Development work this summer has produced a good showing of copper. Mr. MacKinnon, of Vancouver holds an option on this property.

William Davidson has made a discovery of copper at the mouth of Gun Creek. The first assay shows 6 per cent. copper and 2 per cent. nickel in addition to gold and silver values.

PERSONAL.

Mr. M. F. Fairlie, superintendent of the reduction plant of the Mining Corporation, is now in charge also of the mining operations. Mr. Fairlie succeeds Mr. Chas. E. Watson, who was lost on the "Princess Sophia."

Mr. A. D. Miles, president of the International Nickel Co. of Canada, Ltd., is in Toronto. The company's head office is to be in the new building of the Toronto Harbor Commission.

Mr. J. L. Agnew is now vice-president of the International Nickel Co. of Canada, and is in charge of the company's mines and smelter in the Sudbury district, until recently operated by the Canadian Copper Co. Mr. J. C. Nicols is general superintendent. Mr. E. T. Corkill is superintendent of mines. Mr. E. A. Collins succeeds Mr. Corkill as safety engineer.

Mr. John More is general manager of the nickel refinery at Port Colborne.

Mr. J. B. Tyrrell has returned to Toronto from Matachewan.

Mr. Robt. Bryce has returned to Toronto from New York.

Mr. T. J. Flynn is in Toronto.

J. A. McLean has resigned as advertising manager of the Canadian General Electric Co.

Mr. Nicol Thompson will act as chairman of the Vancouver Chamber of Mines until the next annual election.

Mr. Oscar Lachmund, former manager of the Canada Copper Corporation, has opened an office in Spokane, Wn., his line of business being the revision of smelter contracts, the determination of process for treatment of ore, flow sheets for mills and the examination and non-resident management of small mines.

Mr. James L. Brown has been appointed Overman at No. 7 Mine, Canadian Collieries (D) Ltd., vice Mr. Robert Brown.

Dr. Jas. L. McKee, formerly of the University of Cork, Ireland, has been taken on the chemistry staff at Queen's University. Dr. McKee served as chief chemist for the British Explosive Company, whose plant was recently destroyed at Trenton, Ont.

Prof. V. C. Clarke, of the department of Economic Science at Queen's University, has been released by Queen's University for a year at the request of the Dominion Government, in order that he might get to Ottawa to assist the Department of Labor in problems of reconstruction following the war.

Hon. Martin Burrell, Minister of Mines, has returned to Ottawa, after a trip to British Columbia.

Mr. Geo. Mackenzie, of the Mines Branch, has returned to Ottawa from British Columbia.

A meeting of the Council of the Canadian Mining Institute was held in Montreal on Friday, November 15th. It was decided that the next annual meeting will be held in Montreal in March.

Mr. S. T. Kirkpatrick, of M. J. O'Brien, Limited, is opening offices in the Union Bank Building, Ottawa. Mr. N. B. Davis, of Kingston, has joined the staff. Research work for the company will be carried on at Queen's University by Dr. Drury.

Mr. G. J. Mackay succeeds Prof. Kirkpatrick as Professor of Metallurgy at Queen's University.

Prof. J. C. Gwillim, Professor of Mining at Queen's University, has been granted a year's leave of absence, and will stay in the West.

OBITUARY.

Sydney A. Lang.

The death of Lieut. Sydney A. Lang at St. John's Camp recently, makes a total of seven that have passed away out of the graduating class of 1914 in the Mining Department of the University of Toronto. There were twenty members of this class. Five have made the supreme sacrifice in France, while two have died in Canada. Three other members have been on the casualty lists at various times. The record of the class is one that the University of Toronto and Canadian mining engineers may well be proud of.

F. C. Andrews, J. S. Taylor, S. D. Ellis, J. S. Fleming and G. B. Taylor fell in France. W. A. MacDonald and S. A. Lang passed away in Canada. May we be pardoned for suggesting that possibly the spirit of Dean Galbraith which was instilled in these boys at college, showed them the path of duty and helped them die like men?—D. S. H.

A. B. Clabon.

A. B. Clabon, president of the Vancouver Chamber of Mines, lost his life on the afternoon of Wednesday, October 16th, when he fell over a precipice at Silver Creek, B.C., striking a ledge of rocks 100 ft. below, from which his body rebounded and was thrown 100 ft. further down the gully. Mr. Clabon had been active in mining affairs for many years, residing for a time at the Rossland Camp, before moving to Vancouver. Keenly interested in the mineral development of British Columbia, he took a prominent part, in common with officers and members of the Chamber of Mines, in bringing to public attention the possibilities of the industry. Within the last few weeks he was instrumental in interesting Eastern capitalists in the Wolsely claims, Silver Creek, and it was in connection with this business that he was visiting the properties when the fatal accident happened. Mr. Clabon was well known in Toronto, where he resided for some time, as well as in British Columbia where most of his mining interest was.

Two tons of ore containing platinum values have been shipped from Olivine Mountain, Tulameen, B.C., by the Olivine Mountain Syndicate, the members of which include some prominent residents of Vancouver, B.C. It has been forwarded to the Faust Concentrating Plant, Seattle, Wn., for a test with a view to ascertaining whether platinum can be extracted in sufficient quantity and at a cost low enough to make the operations a commercial success. If this can be demonstrated it is the intention of the Syndicate to install a plant at Tulameen to produce platinum from the dunite which carries this mineral along with gold, copper and microscopic diamonds.

Representations are being made to Hon. Martin Burrell, Canadian Minister of Mines, favoring the appointment of a Canadian mining man to the Commission to Siberia from the Dominion. Those supporting this proposal point out that there is as much common interest between the western section of Canada and Siberia in respect of mining as there is in regard to agriculture, fisheries, and transportation. They argue that it is important that the mineral resources of the two countries would be better known and better understood in each of the countries with a view to laying the foundation for the period of economic and commercial development which will follow the cessation of hostilities.

SPECIAL CORRESPONDENCE

BRITISH COLUMBIA.

What is described as quite an important discovery of chrome ore is reported by Messrs. Frank Tracey and C. A. McKay. The desposit is situated in Taylor Basin a short distance off the old Chilcotin Trail, British Columbia. Samples have been left at the quarters of the Chamber of Mines, Vancouver, which have made a favorable impression. The prospects have not yet been developed.

Mining men of this Province are interested in a specimen of nickel ore from a new discovery in the Bridge River District, British Columbia. When the lead was exposed it was thought that its chief value was copper, but returns from the Ottawa Assay Office show that its primary content is nickel, with silver, copper and platinum values. Three claims have been located and the intention is to develop them without loss of time.

Assurance has been given that the development of the Silver Creek Mining Property, near Revelstoke, B.C., will not be unduly delayed by the deaths of Messrs. C. E. Watson and G. O. Randolph, who went down with the Str. Princess Sophia. A successor to Mr. Randolph will arrive at the property shortly to take up his work, and development will proceed without cessation.

Consolidated M. & S. Acquires Voight Properties.

The Voight Copper Property on Copper Mountain near Princeton, B.C., has been acquired by the Consolidated Mining and Smelting Co. of Canada. This is one of the best known low-grade properties in British Columbia, the claims covering some 6,000 acres and having been in the possession of Mr. Emil Voight for several years. At different times there have been reports that the property had been disposed of, but the companies or syndicates taking them over, while doing considerable work, failed to carry through the purchase. As a result of these transactions legal actions developed from which Mr. Voight has emerged with his title confirmed. While no announcement is made as to the monetary consideration involved in the latest deal there is no doubt that the sum is substantial as the claims have been held for close up to \$1,000,000. The Voight Claims cover fully one-half of Copper Mountain, the Canada Copper Company owning the other half, on which it has done a large amount of development work in recent years and now is fast preparing to commence actual mining. These preliminary preparations, it may be said, include the construction of a 2,000 ton concentrator, the building by the Kettle Valley Railway of a branch line, fourteen miles in length to the mine, and an extension of the power line at Greenwood, B.C., to the property, a distance of about 100 miles. It is expected that the Consolidated Mining and Smelting Co. will inaugurate extensive development operations in connection with its new holdings.

Rocher DeBoule Copper.

The Rocher DeBoule Copper Company has closed down its mine which is situated about 10 miles from Hazelton, B.C., and the ore of which carries good copper values with low values in gold and silver. It is expected that next year a small mill, capable of treating approximately 50 tons a day, will be installed for the purpose of handling the milling ore reserves now in the mine. This work, however, is entirely dependent on the labor market, cost of machinery, etc. The mine was worked steadily this year until the end of September and about 4,000 tons of ore was shipped averaging 7 per cent. copper and \$4 a ton in gold and silver values.

Surf Inlet Mines.

Late reports regarding the operation of the Surf Inlet Mines, British Columbia, are very satisfactory. The tonnage milled, gross value, and net profits for the current year since date of the last annual report are given as follows:

	Tons Milled	Gross Yield	Profit per Month
March.....	8,377	\$95,863	\$37,376
April.....	9,141	84,204	31,460
May.....	8,957	79,780	24,147
June.....	8,880	88,726	30,047
July.....	9,407	89,132	31,153
August.....	7,158	81,069	24,888
Totals $\frac{1}{2}$ year.	52,920	\$518,774	\$179,171

It is stated that the ore reserves will warrant an increase in the milling capacity when gold mining conditions become more favorable.

Silver Standard.

The Silver Standard Mine, situated about five miles from Hazelton, B.C., and the character of the ore of which is silver-lead-zinc, is proceeding with development work. According to report a new shoot of high grade ore has been struck. It is four feet in width and from it a considerable tonnage of clean ore will be available for shipment. A new 50 ton mill, which was commenced in the fall of 1917, was completed in June and changes, additions and improvements also were made in the power plant and surface buildings at the mine.

Will Develop Fitzsimmons Claims.

The Fitzsimmons Group of Copper Mineral Claims, situated on Green Lake, are to be developed, having been bonded by the Consolidated Mining and Smelting Company. A camp has been installed, a trail built to the lower mineral showings, and the work will be pushed forward during the winter. As this is the third property on the coast taken over by the Consolidated Company mining men are expressing the opinion that it is indicative of a fixed policy to obtain control of properties possessing, in the aggregate, a sufficient tonnage of ore to warrant the construction of another smelter somewhere on the British Columbia Coast. That this is the ultimate intention of the company is the belief of most of those who have been watching mining development in the province during recent years.

Quesnel Placer Mining.

Interesting experimental work has been in progress during the past summer on the placer property of the Quesnel Hydraulic Mining Co., situated on Twenty-mile Creek, Quesnel River. This ground consists of an immense deposit of gravel, in part gold bearing. Under the management of Mr. Howard Du Bois an ample water supply for large scale hydraulicking operations was laid on the property, the complete equipment costing about \$1,000,000, and being finished in 1911. The 1912 operations, however, proved a failure as the gravel did not contain sufficient gold to pay operating expenses. Since then prospecting and testing has been carried on under the present management with a view to deciding whether portions of the gravel deposit will pay to work. In the course of last year's investigations it was found that the black sand concentrates in the riffles of the sluices carried, in places, appreciable platinum values. This year, therefore, a plant was installed to save this black sand, the fine material being taken from the sluice box by an undercurrent and put through a mill consisting of jigs and table and a clean black sand concentrate being obtained. From one half to two tons of this material a day is being re-

covered; the daily recovery varying greatly as different strata of the gravel are being hydraulicked. The question of platinum values, however, is not settled yet, as some assays show platinum and others do not. Thorough testing of the black sand is being carried out.

Takes Options on Silver-Lead-Zinc Claims.

Options have been secured on about a dozen mineral claims situated on Nine Mile Mountain, twelve miles from Hazelton, B.C., by Mr. T. R. Jones, acting for a Toronto Syndicate. The more important of these properties are the Sunrise, Silver Cup, Lead King, and Miller. They were worked some years ago but since have been idle until this year, when surface work was undertaken with encouraging results. The ore is silver-lead-zinc, and it is expected that vigorous development will be initiated next summer.

Alice Arm.

The railway and tram line up the Kitsault River, linking up the Dolly Varden Mine with the Alice Arm Camp, and furnishing an outlet for what is expected to develop into one of the most productive mineral districts of the northern section of British Columbia are almost completed. Mining men anticipate that, with transportation facilities provided, the copper, silver, lead and zinc ores of Alice Arm and the tributary country will be opened up, that several large shipping mines will be in operation shortly, and that prospecting will prove further possibilities than those now indicated. It is asserted that the Granby Consolidated Mining and Smelting Co. is interested in the Alice Arm country which is taken as a sure sign that mining activity will become more pronounced. One reason given for this belief is the fact that the company has surveyed the water-power of the district, the object being, it is confidently stated, the selection of a site for a plant with which to prosecute mining operations.

INTERNATIONAL NICKEL.

New York, Nov. 10th.—The International Nickel Company reports a surplus of \$3,415,905 for the six months ending September 30th, after the deduction of charges, war taxes and preferred dividends. This is equivalent to \$2.04 a share on the common stock, as compared with \$2.68 for the corresponding months of 1917 when there was a surplus of \$4,484,396. The total income for the first half of this year was \$7,809,342, an increase over the preceding year of \$102,279. Administration and general expenses, however, increased by just about this amount.

The decrease in surplus is accounted for by the heavier appropriation made to cover United States and foreign taxes, \$2,749,126 being set aside for this purpose, an increase of practically \$1,000,000 above the reservation of \$1,741,140 during the corresponding period of 1917. After the deduction of \$995,090 for depreciation, practically the same amount as that set aside a year ago, there are profits of \$3,683,283. The preferred dividends amounted to \$267,378, leaving a balance for the common of \$3,415,905.

Satisfactory progress is being made in the installation of plant necessary for the fuller development of the Gibson mineral claims situated in the Ainsworth Mining Division, B.C. A new compressor and power plant are being placed, the former close to the mining operations and the electric plant at a greater distance. A Plenton wheel is to be used to operate the compressor, it being planned to provide sufficient air to keep three drills going at the mine. The work is being rushed with a view to having the entire plant ready for work by the end of the year, and it is confidently expected that this will be achieved, more especially as the former difficulty of securing labor seems to be somewhat relieved.

NORTHERN ONTARIO

Lake Shore

From month to month a steady increase in production is being shown at the Lake Shore Mines at Kirkland Lake. The August record was the highest in the company's history. With a capitalization of \$2,000,000, the company has been brought from a prospect to the producing stage, without further financial encumbrance, chiefly through the efforts of the staker of the claims and present president of the company, Mr. Harry Oakes. This satisfactory financing and management of the concern led to the results of the first clean-up being available for the treasury of the company. The mill was first placed in operation on the 8th of March last. Not only is the company now in a position to disburse dividends at the rate of about 10 per cent. annually, but it is also in a position to add steadily to the net surplus, and thus from profits in excess of dividend requirements will be able to finance further enlargement to milling equipment and enlarged plans of underground development of the property. The company made its initial dividend disbursement of $2\frac{1}{2}$ per cent. on August 20th last. It is considered highly probable that a second disbursement will be made before the end of the current year. With a production of upwards of \$40,000 per month the company is turning out about half a million in gold per annum.

What appears to be an important discovery of gold has been made on the Cullen-Renaud claims adjoining the Miller-Independence property at Boston Creek. The new find is a short distance south from the north boundary of the south claim of the group. The vein has a strike of southeast and northwest and may thus be said to run at right angles to the Miller-Independence. The break in which the gold values occur is about eight feet in width. Exceedingly spectacular splashes of gold are in evidence. However, what is considered a more important feature of the deposit is the very probable presence of tellurides in the ore. This property was recently optioned to Robert W. Norrington and his associates of Detroit, and the work being done is under the supervision of these interests. The work of further opening up the vein is proceeding, and it should soon be possible to estimate the importance of the find. Earlier efforts at the opening up of this property it appears were partly conducted on this vein which cut across a large porphyry dike on which development work was chiefly centered. At one point the dike was broken up and contained high grade gold values, while either to the northeast or southwest it was found to contain little or no gold. Thus some years ago the present vein was in reality discovered without the owners of the property being aware of the fact that it constituted a high grade vein cutting the porphyry dike at right angles.

Miller-Independence

Cross-cutting is under way at the 200-foot level of the Miller-Independence property at Boston Creek. The ore deposition has been proven to continue with undiminished consistency to this depth and the richness of the vein matter is second to none so far discovered in the whole north country. With the 40-ton mill in operation within the next week or two, and drawing ore from such an important body the mine promises soon to become an important producer. A large number of other properties in the district, including the Boston Gold Leaf, the Mondeau, the Hughes Group, the Cotter, and others are receiving a good deal of attention and a number of more or less important discoveries have been recorded. Thus the Boston Creek field may safely be said to be now in the throes of a boom, which if normal conditions existed, would probably equal any other such period in the life of the various mining camps of the north country.

Pittsburg-Lorrain

Milling operations continue by the Pittsburg-Lorrain Syndicate, operators of the old Currie Property, as well as operators under lease of the old Wettlaufer mine of South Lorrain. A small oil flotation plant has been added to the equipment of the old mill on the property, and is being used in the treatment of the ore. During the month of September the company shipped one carload from the Pittsburg-Lorrain and it is understood another shipment is about ready to go forward.

Teck-Hughes

Underground development at the Teck-Hughes mine has been resumed at Kirkland Lake, and efforts are being made to get the required number of men to place the milling end of the mine in operation also. The mine was closed down several months ago due to the supply of labor being inadequate, and the costs of material almost prohibitive. The announcement of a resumption of operations, therefore, came as somewhat of a surprise in the north. The property is equipped with an 80-ton mill. The ore bodies in the mine occur in more or less lenticular bodies, these bodies sometimes widening out to upwards of thirty feet. The operation of the mill during previous working did not prove as satisfactory as might have been expected. The policy to be adopted by the company in the new effort at operation has not been announced.

Schumacher

A loss of \$7,695 for the fiscal year's operation ended March 31st last, is shown in the annual report of the Schumacher Gold Mines, Limited, which is being mailed to shareholders. Bullion production amounted to \$202,387, and other small credits raised the total income to \$202,783, while costs total \$210,479. The surplus carried forward was \$65,530, as against \$73,013 the year before.

President F. W. Schumacher says in his report that, by resorting to selective mining, the property could have been kept in operation, but that it was decided to close on July 15th, rather than mine the rich lenses of ore.

During the period of operation development work was aggressively carried on as is shown by the following figures: Drifting, 1442.2 feet; cross-cutting, 1127.9 feet; raising, 178.7 feet; diamond drilling, 705 feet; stoping, 15,753 cubic yards.

The mill treated 45,373 tons of ore valued at \$259,365.30 and recovered bullion worth \$242,060.84. Income from other sources amounted to \$635.59. Operating cost amounted to \$234,021.33 being \$1.22.02 per ton of ore milled for milling, and \$3.93.75 per ton of ore milled for mining, and all other charges except depreciation. The foregoing figures are from the period between March 31st, 1917, and July 15th, 1918.

Referring to the success of the adjoining properties, the Hollinger and McIntyre at depth, the president points out that the Schumacher directors had mapped out a policy of exploration at depth, but war conditions prevented its carrying out, consequently ore reserves have not been augmented much since the previous annual report.

Toronto, Nov. 14th.—A special meeting of the shareholders of the Schumacher Gold Mines was held immediately before the annual meeting to-day, at which the by-law providing for the sale of 100,000 shares of treasury stock at a discount of not more than 55 per cent. was ratified. A total of \$1,260,000 shares were represented.

At the annual meeting the annual report was passed and the old directors were re-elected, except that Charles A. Cover was elected in place of O. C. Manley, F. L. Culver, vice-president, presided and spoke of the in-

evitable favorable effects of the imminence of peace on the gold industry, and expressed himself as sanguine that it would not be very long before the mill resumed operations.

He said it was the intention of the management to sink the main shaft ultimately to the 1,000 or 1,200 foot level. The mill, he added, had a capacity of 180 tons per day, and a small addition to machinery would readily increase the capacity to 300 tons.

THE SPITZENBERGEN COAL MINES.

There have appeared recently in the daily press many news items concerning coal mining in Spitzbergen. These followed an announcement that a British expedition had reached Spitzbergen to operate the mines.

The development of the coal mines of Spitzbergen is largely due to the efforts of an American, well-known in the Lake Superior iron districts, J. M. Longyear, of Marquette. He successfully carried on exploration in the face of many difficulties, not the least of which was the inability to secure title to the properties.

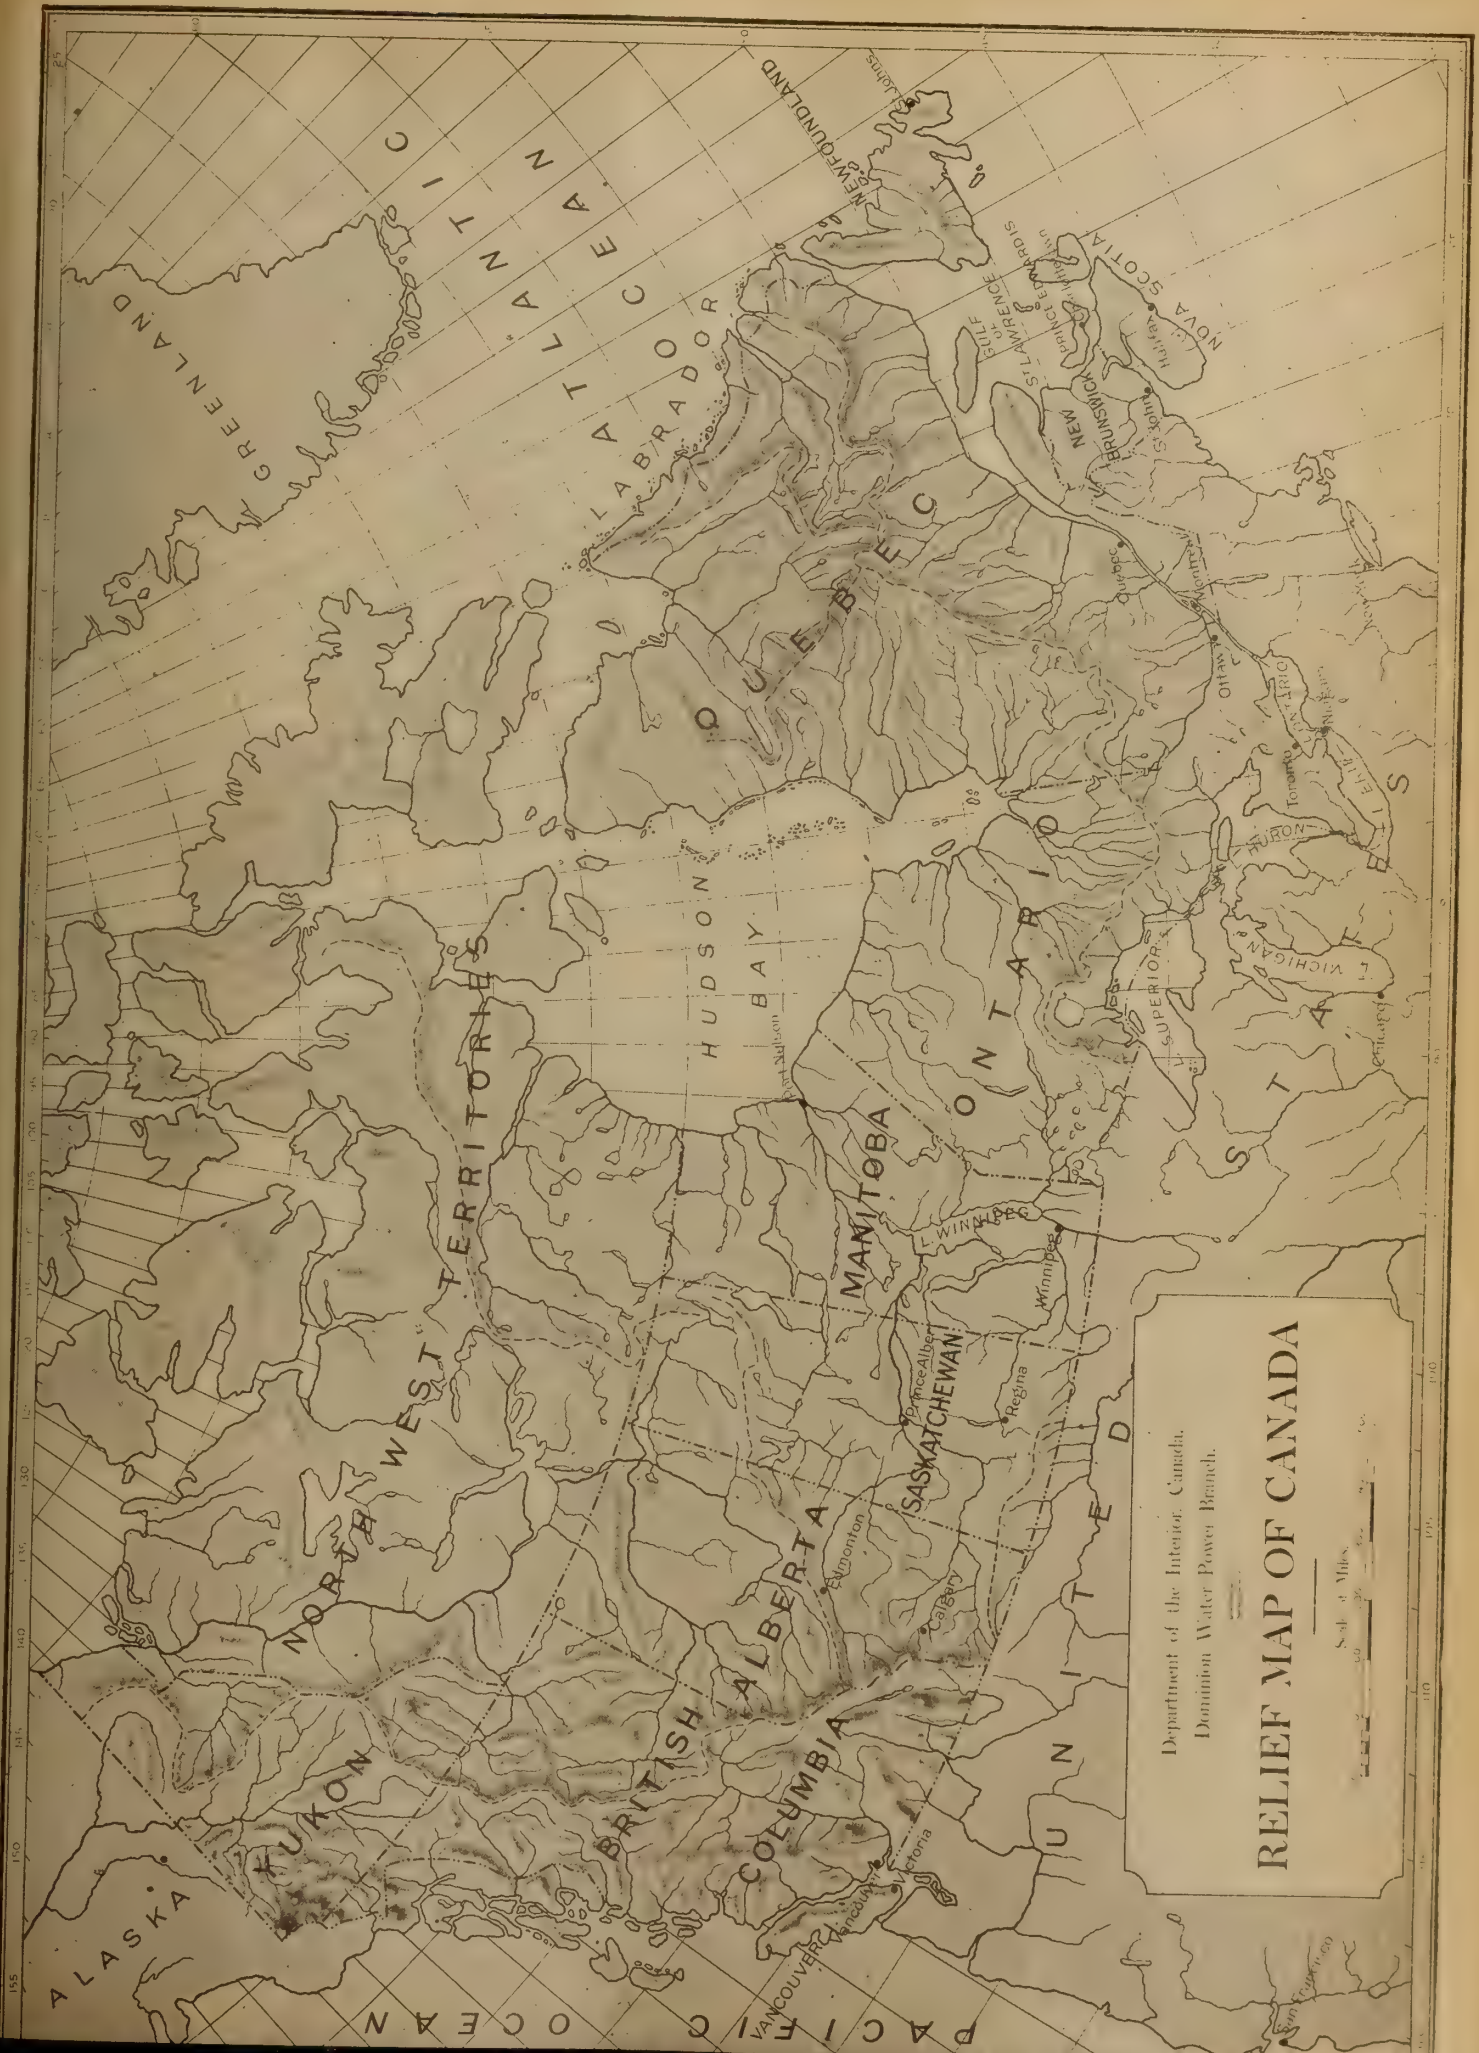

The Spitzbergen islands apparently belong to no country. Mr. Geo. E. Edwards, in an article published by the "Mining World," a few years ago, quoted Mr. Longyear as saying, "If some one stronger puts us off, the property is his." The British Government apparently declared sovereignty over Spitzbergen in 1870, but later renounced title.

The Arctic Coal Co. organized by Mr. Longyear began operations in 1905, holding its property only by possession. Though cut off from the outside world for about eight months of the year, mining was carried on steadily. Mr. Edwards wrote in 1914: "The mine is on a hillside, and the coal is dropped to the stock pile on the ocean shore at Advent Bay by means of an aerial tramway. When navigation opens (in June), this stock-pile contains about 100,000 tons, which is about the present annual shipment. The coal is loaded by crane into cars which run out to bins at the ship landing at the end of a long dock. The dock remains a mass of ice and stone the year round. . . . Everything used about the mines must be shipped in to Spitzbergen, even timber. . . . The staff are mainly American and Norwegian. . . . Two seams are being worked. These contain about 100,000,000 tons of coal, estimated as in sight."

The Norwegian Government has a wireless station about 30 miles from the coal mine, and there is a smaller installation at the mine thus giving communication with the outside world.

DEVELOPING MINERAL DEPOSITS NEAR EDGEWOOD, BRITISH COLUMBIA.

Near Edgewood, B.C., on the west side of the Arrow Lakes, and 100 miles from Revelstoke, B.C., there is a mineral belt colloquially known as Lightning-Peak which is being actively developed. There is work in progress on six properties in this locality, the Waterloo, Silver Spot, Dictator and Extension, Rampolo, Lightning Group and Lumpy Group. High grade ore is being shipped from the Waterloo and it is the intention to continue work all winter. Development is underway on the Silver Spot, Dictator and Extension, and the Rampolo, some very fine ore being in sight on the latter. The Lightning Group will be worked without cessation and the Lumpy Group, a new discovery, is to be opened up by the driving of a tunnel this winter to the ledge at 100 ft. depth. Camp is being built and supplies secured. The ledge is said to be 60 ft. wide, and to give values of 145.5 ounces silver, with a picked sample showing 675.5 ounces at the grass roots. A pack trail is the only present means of transportation and it is understood that the Government is to be asked for financial aid in the construction of a permanent trail or wagon road.

KERR LAKE

The annual report of the Kerr Lake Mining Company for the year ending August 31st proved pleasing reading for the shareholders of the famous Cobalt company as well as for all interested in the welfare of the mining camp. In spite of the company's record production the ore reserves were maintained, showing as of September 1st, 1918: 34,730 tons containing 639,800 ounces of silver, and 997,500 ounces of high grade silver, a total of 1,637,000 ounces of silver. In ounces produced as well as value received for the product the past year was the best in the history of the company. The production for the past year amounted to 2,582,993 ounces, against 2,551,345 ounces the preceding year. The total income of the operating company was \$2,394,218, against \$1,909,465 in 1917 and \$1,286,209 in 1916. After paying surplus and dividends a surplus was left of \$1,022,316, an increase over the previous year of \$344,841 and an increase over 1916 of \$880,615. The high price of silver for the current year accounts for the big surplus after the payment of the 20 per cent. in dividends. The company carried forward a balance from the previous year of \$1,711,045 which brings the balance carried forward to the end of the present year to \$2,733,361, while the outstanding stock of the company equals only \$3,000,000. The costs of production totalled 28 cents per ounce. The total amount paid in dividends to August 31st, 1918, was \$7,710,000.

During the year 3,088 feet of development work was done by drifting, cross-cutting, raising and sinking in the more favorable portions of the property. This development footage compares with 3,105 feet last year. As the ore reserves of the mine are decreasing each year, we may expect the grade of future ore extracted to also decrease. The total estimates of ore given in the report may be considered positive commercial ore under present conditions, although future development by stoping and otherwise may somewhat increase these figures."

This statement by the company proves the importance of the silver mining industry not only to the shareholders of the Kerr Lake Mining Company and the Cobalt district itself, but to the Province of Ontario, and the Dominion of Canada, all of which receive in one form and another a share of the large earnings of this progressive mining concern.

DETERIORATION OF WIRE ROPE.

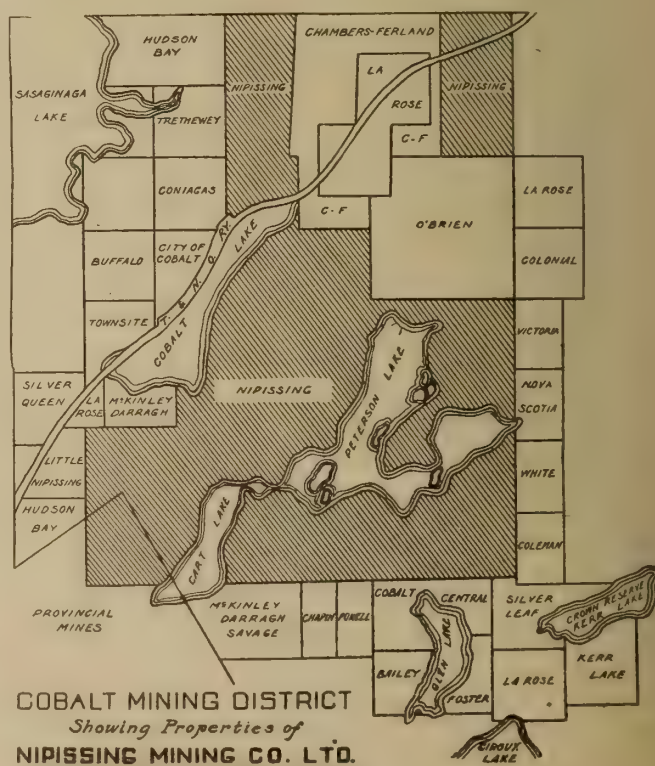

Wm. Fleet Robertson, Provincial Mineralogist for the Province of British Columbia, has returned to Victoria from Montreal, where he has been testing the cable used in Protection Shaft, Western Fuel Company of Canada, the breaking of which allowed a descending cage, loaded with miners on their way to work, to fall, carrying its passengers to instant death. What Mr. Robertson was able to ascertain as to the cause of the breaking of this rope will be told to a Coroner's Jury in Nanaimo, B.C., on the 19th of November. It is understood that he will be able to show that the break was the result of internal corrosion, brought on by the action of water. This, however, is not official, but it is known definitely that the Provincial Mineralogist carried out some careful experiments in the laboratory of McGill University and that, as a result, he will have some interesting statement to make, not alone as to the reason for the deterioration of the steel rope of Protection Shaft, but with reference to the best means of preserving cables of similar character used in mining operations from like deterioration.

INTERNATIONAL COAL CO.

Diamond drilling of coal measures situated near the mouth of the Chemainus River, Vancouver Island, is being resumed as a result of the successful defence in the

court by Mr. H. W. Treat, of his Provincial Title to these coal lands. The soundness of the licenses he holds, it will be recalled, was contested by the E. & N. Railway Co. Mr. H. W. Treat announced that the work would proceed a few days after the court's decision. He is of the opinion that the coal measures in question are the same as were worked by the old Wellington (B.C.) Mine, the area being prospected in this instance being about eight square miles, off the foreshore. The operations, it has been disclosed, are being carried on by the International Coal Co. at the head of which is Mr. Samuel Hill, of Seattle, Wn., son-in-law of the late railway magnate, Mr. James J. Hill. It is pointed out that one great advantage possessed by this property in the event of the existence of coal in commercial quantities being proved, is its accessibility. Its location on the waterfront, it is figured, will permit coal to be placed in the hands of dealers at least 50 cents a ton cheaper than can be done in the cases of most of the Island mines.

Advices from the Stewart (B.C.) Mining Camp indicate that that little community has suffered severely through the ravages of Influenza. With insufficient drugs, no doctor immediately available, and little or no liquor to be had, the patients not only were without skilled professional attention, but could be given nothing more than personal care. The latter was provided by the miners and prospectors of the surrounding districts, who dropped their work for the purpose, all the women of the town being ill. In a mining way Stewart seems to be flourishing, miners from the locality predicting that it is going to prove the biggest gold and silver producing section of British Columbia. The Bush Property near Cascade Creek, recently acquired from a New York Syndicate by Mr. R. K. Neill, of Spokane, Wn., is spoken of most optimistically. Mr. Neill, who came south some weeks ago, is making arrangements for the transportation of ore this winter. The Nesbitt, George, and Lesley properties also are mentioned, and a new company was incorporated recently to work the latter group.

Map showing location of Kerr Lake property.

The Situation at Rossland.

One of the most striking illustrations in British Columbia of the effect of the reduced purchasing power of gold is the situation at present at Rossland, B.C., where the mines of the Consolidated Mining & Smelting Co. have been practically closed down. There has been no ore shipped for some months although work is being carried on in the chief mines of the Camp with small forces. Those employed, however, are engaged only in development, preparations being made for the renewal of activity as soon as conditions again become normal. Only about 200 miners are working in the Le Roi, Centre Star, and War Eagle, while about 80 are employed in the Josie all of which are Consolidated Company's mines. On the Velvet, situated about nine miles from Rossland and owned by Granby Company interests, there are some 50 men. The people of Rossland, however, are not discouraged. The camp is being sustained by other forms of mining and better times than ever are anticipated later on when, it is expected, the mines now dormant will be reopened on a larger scale than heretofore. It is the firm belief that the time is not far off when costs will decline and the demand for gold will continue to be insistent.

Loper Goes to Penitentiary for Over Issue of Stock.

Mining men of this Province have been following the prosecution of Mr. G. Weaver Loper, formerly president of the Lucky Jim Zinc Mines of Victoria, B.C., with considerable interest. On October 2nd, he pleaded guilty to the charge of fraudulently over-issuing stock of the concern, having been arraigned at Spokane, Wn., He was sentenced to a term of from one to ten years in the penitentiary of that State.

Developing Old Sport Copper Property.

Development work on a fairly large scale continues on the Old Sport Group, which is a block of claims under bond to the Consolidated Mining & Smelting Co., since September, 1916, situated on Elk Lake near Quatsino Sound. Operations up to the present have been directed to the proving of a large tonnage of low grade copper ore which may be said to have been already practically established. Diamond drilling has been carried out with satisfactory results and it is confidently expected that it will not be long now before the company is prepared to commence shipping. The ore values, generally speaking, run between 1.4 and 4 per cent. Mr. Wm. Brewer, District Mining Engineer, in his report of 1916, says, in this connection: "In some parts of the orebody exposed in the main adit the copper values run as high as 14 per cent. for a width of 4 or 5 feet, but, so far as known at present, these enriched shoots are irregular and of such limited extent that the value of the property is based on the much larger tonnage of ore of low grade." Last year Mr. Brewer visited the property again and, among other things observed: "A water power plant has been developed from Canyon Creek, which furnishes at present with a 350 ft. head, 50 horse power, but can be developed to furnish about 425 horse-power at low water. The flume is 8,000 ft. long to a pipe line 900 ft. long. A compressor plant for two drills is installed at the camp on Elk Lake and the air carried to the mine-workings through a pipe-line; also an electric light plant, the dynamo of which is run by a 6-inch Pelton motor. At the mine there is a 7 x 9-inch double cylinder friction-hoist run by compressed air which hoists a 1-ton skip. There is also a Cameron sinking-pump, capacity 65 gallons a minute, and an Allis-Chalmers feed-pump, capacity about 35 gallons a minute." Plans are said to be in hand for the construction of a line of railway from the mine to the coast for the purpose of facilitating the transportation of ore,

Developing Copper Deposit on Sunlock Group.

Another promising Vancouver Island property, which is attracting considerable attention, is the Sunlock Group, situated on the Jordon River about forty-two miles by motor road from Victoria, B.C., It is in the development state as yet, but the extensive work being carried out under the supervision of Mr. R. H. Stewart, manager, and formerly with the Consolidated Mining & Smelting Co., has had such results that mining men are predicting that it will prove one of the biggest producers of the Province. Mr. W. M. Brewer, District Engineer, inspected the property last year. Referring to the development work done up to the time of his visit he says that it "consisted of four adits or tunnels exposing three distinct zones, as well as extensive surface stripping across another, known as the 'Centre Zone,' where three open-cuts have been made on apparently three separate mineralized zones at elevations between 780 and 865 feet. Each cut is about 20 feet long across an orebody." It is a low grade copper prospect, samples showing values running between 1.2 to 2.7 per cent., and some carrying gold and silver to the combined value of about 50 cents a ton. This property is being opened up by British Columbia capital chiefly. Besides the work of establishing ore tonnage, which is going ahead steadily, a wagon road has been constructed this year a distance of 6,000 ft. for use in shipping supplies, etc., and also, ultimately, for utilization in the transportation of ore.

The Monitor Mine is Shut Down.

The Monitor Mine, Alberni Canal, Vancouver Island, has been shut down temporarily. It is understood that Mr. Samuel Rider, of St. Albans, Eng., one of the chief owners, is contemplating a re-organization of affairs along such lines as will permit the property to be reopened and established as a permanent shipper. This property carries copper running from 1 to 18 per cent.

MR. C. F. LAW ADDRESSES BOARD OF TRADE.

The urgent need of developing an iron and steel industry in British Columbia was the keynote of an address delivered by Mr. C. F. Law, chairman of the Mining Committee of the Vancouver Board of Trade, before a convention of the British Columbia Boards of Trade on the 15th of October. He asserted that there were 12,000,000 tons of iron ore in sight in the iron deposits along the coast, the Gulf Islands and in Northern sections of the Province. He advocated a bonus by the Dominion Government on pig iron production. Dealing with the obtaining of the necessary fuel he told of the anthracite field of the Carbon District, British Columbia, declaring it to be one of the richest in the world. Touching on the slump in gold production, Mr. Law, recommended the remission of taxation on gold mining, and that all supplies and materials be permitted to enter Canada duty free.

LOCATING CLAIMS IN GRAND FORKS DIVISION.

As illustrating the present mining activity in British Columbia, some figures dealing with the condition in the Grand Forks Mining Division are interesting. In this section this year up to the end of the month of July there had been recorded 80 mineral locations and between January 1st and September 30th, there were recorded 53 certificates of improvement. It may be stated that this section includes the chrome belt of Cascade, B.C., which to some extent explains the remarkable showing made in locations.

According to prospectors returning from the district southwest of Matagami, near Devil's LJe, indications of platinum have been found. No details regarding the reported find are to hand as yet.

MINING IN HAZELTON DISTRICT, B. C.

Mr. J. D. Galloway, Provincial Resident Mining Engineer for the North-Eastern Mineral District of British Columbia with headquarters at Hazelton, B.C., states that mining development in this district has not been as active during the past year as its mineral possibilities warrant, because of the high cost of labor and of mining supplies, especially powder and machinery. He expresses the opinion that, while capital has been available for mining in many forms, the high cost of development has hindered the investment of capital in properties in the prospect stage which necessarily is speculative. Undoubtedly when the war is over, Mr. Galloway avers, many men will return to the northern country and prospecting, which now has practically ceased, will be revived and important discoveries may be made. Referring to the Keithley Creek section of the Cariboo District, he says that it is now virtually deserted although there is considerable placer ground remaining which may be worked at a profit. With the revival of gold mining which should take place after the declaration of peace, he anticipates that the district will attract more attention.

MILL COMPLETED AT SILVER-STANDARD MINE.

The Silver-Standard Mine, Omineca District, B.C., has completed the construction of a 50-ton mill which was commenced in 1917, and changes, additions and improvements also have been made in the power plant and surface buildings at the mine. It is estimated that the cost of the new construction has run between \$30,000 and \$35,000. From June to September the mill was run one shift treating from 17 to 20 tons a day, but it was gradually improved and now is operating two shifts and the production for the last six months of 1918 is estimated at 4,900 tons (milled). Practically no mining was done this year until the 1st of October, the ore for the mill being taken from the dumps. Development, however, is proceeding steadily with very satisfactory results.

MINE HOISTS

This is one of the favorite designs of our small Mine Hoists. The engines are reversing, so the load is under perfect steam control either going up or down.

We make this Hoist in 7 sizes, from 10 to 50-Horse-Power, and with any diameter drum up to 48 inches.

Our catalog shows many other types of Mine Hoists. If the kind you want is not there, let us give you a price on it, made to your liking, from your own specifications.

Marsh Engineering Works, Ltd.

MINE CAGES

Our Mine Cages are safe for the men. They are strongly constructed to resist all possible strains, are fitted with automatic safety device, and are made with plate sides and hinged top.

We make these cages to fit your shaft.

WE ALSO MAKE
Ore Buckets, various designs.
Mine Cars, any style or size.
Derrick Fittings, Overhead
Sheaves.

Guide Sheaves, etc.

Belleville, Ont. Established 1846

THE PREST-O-LITE COMPANY, INC. BECOMES PREST-O-LITE COMPANY OF CANADA, LIMITED.

In the fields of storage battery manufacture and oxy-acetylene welding, the name Prest-O-Lite has long been synonymous with "Service" throughout Canada. Some years before the United States entered the war, the Prest-O-Lite Co. Inc., recognizing the importance of the Canadian field, came to Canada and established factories for the manufacture of storage batteries and compressed acetylene gas. Canadians everywhere will be interested to know that the service of the Prest-O-Lite Company, Inc., is being perpetuated by Prest-O-Lite Company of Canada, Limited. This new company is a distinctly Canadian organization, incorporated under Canadian laws, and can claim the distinction of being Canada's foremost manufacturers of storage batteries and acetylene gas. The new company starts business with a capital stock of \$800,000, and behind it are the assets, the business, and the good will of its predecessor the Prest-O-Lite Company Inc., of the State of New York. The company's headquarters are in the Prest-O-Lite Building, corner of Elm St. and Centre Ave., Toronto. This is the most modern and completely equipped storage battery plant in Canada to-day.

Up-to-date plants for the manufacturing of Prest-O-Lite compressed acetylene are located at Shawinigan Falls, Que., St. Boniface, Man., and Merritton, Ont. The welding and cutting equipment is made and marketed at the Toronto plant. In addition, the company maintains a warehouse and office in Montreal, and a sales office in Winnipeg. The number and location of these different plants insures adequate distribution and prompt, efficient service from coast to coast.

Mr. R. H. Combs, who has been with the Prest-O-Lite Company Inc., in various capacities since 1908, occupies the position of general manager of the new Canadian company, and under his expert supervision the success of Prest-O-Lite Company of Canada, Limited is assured.

AN ELECTRIC RADIATOR.

In a year when the shortage of fuel has rendered the heating of our houses and camp buildings a more than usually engrossing problem, it is interesting to note that the Salisbury Electric Company, Limited, of Toronto, is making an electric radiator, which, with a very low current consumption will produce heat, and radiate it in exactly the same way as its larger relations, the steam and hot-water radiator.

These radiators are built of pressed steel, and, instead of water, are filled with a specially treated oil, which heats very quickly and radiates the heat more rapidly than water. It is also non-freezable, a great advantage in cases where these radiators are used in small buildings which are sometimes left unheated.

The Salisbury Radiators with their low current consumption may be used with great economy in those places where there is cheap power available, and we are informed that the Granby Consolidated Mining Company have a considerable number of them in use, and find them to be very satisfactory in operation.

The Salisbury Electric Company, Limited, is the development of the old Toronto business of E. F. W. Salisbury, who is the manager of the new firm.

Arrivals from the Klondyke state that the reason for the remarkable exodus of miners from the north is the fact that the government has exempted prospectors from remaining on their claims during the war. It is asserted that the e will be just as great a rush back to the Yukon in the spring, providing peace is declared in the interim.

Oxy-Acetylene Welding and Cutting

This \$3000 Casting Saved From the Scrap Pile

Illustration shows a 5-ton Bolt Header Frame, recently repaired by the Prest-O-Lite Process at the Brantford plant of the Steel Company of Canada.

This casting, which is valued at \$3,000, had 2 cracks, one 15 ins. long by 6 ins. thick, and the other 12 ins. long by 6 ins. thick.

The saving on this one repair was sufficient to pay for the entire welding outfit many times over.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

The Mineral Springs of Canada. Part II., by R. T. Elworthy, B.Sc.

The Mines Branch maintains the following laboratories in which investigations are made with a view to assisting in the development of the general mining industries of Canada:—

Fuel Testing Laboratory.—Testing value of Canadian fuels for steam raising and production of power gas; analyses, and other chemical and physical examinations of solid, liquid and gaseous fuels are also made.

Ore-Dressing Laboratory.—Testing of Canadian ores and minerals, to ascertain most economical methods of treatment.

Chemical Laboratory.—Analysing and assaying of all mineral substances and their manufactured products. Copies of schedules of fees, which are slightly in excess of those charged by private practitioners, may be had on application.

Ceramic Laboratory.—Equipment is such that complete physical tests on clays and shale of the Dominion can be made, to determine their value from an economic standpoint.

Structural Materials Laboratory.—Experimental work on sands, cements and limes is also undertaken.

Applications for reports and particulars relative to having investigations made in the several laboratories should be addressed to The Director, Mines Branch, Department of Mines, Ottawa.

To Users of the Callow Pneumatic Flotation Cell

THE recent decision in the Butte & Superior Suit with Minerals Separation has an important bearing upon the use of the Pneumatic, or Callow method of flotation.

The Appellate Court's decision at Philadelphia, in the Miami case, had already made clear the distinction between (1) froth produced by violent mechanical agitation of the Minerals Separation process, and (2) simple levitation by air bubbles, as practised in the Callow or pneumatic cell, without such agitation.

Now the Appellate Court at San Francisco has interpreted the United States Supreme Court's opinion in the Hyde case, whereby the Minerals Separation Patent was restricted to the use of a minimum, or 'critical' proportion of oil, in combination with violent mechanical agitation.

This latest decision of the Appellate Court in the Butte & Superior case, restricts the Minerals Separation basic patent to the use of a quantity of oil *not in excess of ten pounds (0.5%) per ton of ore, in combination with violent agitation*: it is a logical sequel to the Supreme Court's opinion and confirms the status of the Callow or Pneumatic method of flotation as distinct from the agitation-froth process.

Both the use (1) of oil in excess of ten pounds (0.5%) in combination with violent agitation, and (2) the use of the Callow system of aeration with any quantity of oil, appear therefore to be immune from any charge of infringement.

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.!

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,
Per C. F. BUSS, Superintendent.

Blasting Accessories

E. B. Caps Made in No. 6, No. 7 and No. 8 strengths. No. 8 being twice as strong as No. 6. We strongly recommend our strong blasting caps. They more than pay for themselves in decreasing fume and getting increased work from the explosive.

Blasting Machines Made to explode from 10 to 150 E. B. Caps. These batteries are made with particular care and can be absolutely depended upon to do the work.

Connecting Wire Is especially adapted for our E.B. Caps. Experience has proved that the additional capacity of 20 gauge to carry ample current for a large number of caps more than covers the additional cost.

Leading Wire Made single and double strand. Our single strand leading wire is made of copper wire, is well insulated and adapted for use in larger blasts. Double strand insulating wire is found convenient for use in mines or other places where wires have to be moved frequently.

WE SUPPLY ALL OTHER ACCESSORIES
NECESSARY FOR BLASTING

A. A. SCULLY LIMITED
123 Bay Street, Toronto

RAILWAY, MINING AND CONTRACTORS' EQUIPMENT

ROCK IN COAL MINES

is a common cause of delay in development. When rock bottom must be lifted by hand-drilling, top brushed, overcasts cut, etc., your labor cost is high, and the dead work holds back your tonnage output.

A SULLIVAN PORTABLE DRILL RIG

Will enable you, as it has enabled scores of other colliery operators, to remove rock much more rapidly and at far lower labor cost than is possible by hand drilling.

This outfit consists of a "WK-2" MINE CAR COMPRESSOR and one or more Sullivan ONE MAN ROTATORS.

"WK-2" Compressors are complete, compact little outfits, with receiver, motor and starting panel all on the same truck. The compressor is completely enclosed, self-oiling, with hopper jacketed cylinder and inlet valve unloader. The drive is by internal gear and pinion.

The motor (a. c. or d. c.) is damp proof. Track gauges as orderd.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

AFTER THE WAR

NOW is the time when the Canadian mining industry will come into its own. Europe and the United States must come to Canada for their nickel and asbestos and there will be no after-the-war depression for Canadian mines.

England will place her orders within the Empire. The CANADIAN Ingersoll-Rand company stands ready to supply all your needs in compressed air, from compressor to pneumatic riveter and drill.

LIMITED

COBALT, HAILEYBURY, SOUTH PORCUPINE, TIMMINS

"New Cleveland"

The Drill that gives Super-Service

Owners of the "New Cleveland"—and there are hundreds of them in the different mining centres of Canada—do not know what drill trouble means. From the beginning to the end of the season they stay on the job **continually**, as their solid construction requires no repairs.

They use less air and operate more smoothly than other drills, and the speed and power of the blow enables the runner to break previous records.

This means increased output at a lower cost of production, and with less labor required—a vital consideration these war times.

Use a "New Cleveland" on your job this season and put the "pleasure punch" in your work.

Write for Bulletin No. 35-A, which fully describes the "New Cleveland" Type S Stoper.

OPPORTUNITIES

--for--

Prospectors and Mining Companies

The mineral wealth of Northern Ontario is enormous. From a few developed areas a very large output of nickel, copper, silver and gold is being made. Many promising areas are awaiting the prospector and miner.

Recently Northern Manitoba has become an important producer of copper ore, and many promising gold deposits have been located. This is an excellent field for the prospector.

One of the greatest factors in development of mineral areas is the provision of transportation facilities. Railways and the mining industry have together played a very important part in the development of several parts of Canada.

The Canadian Northern Railway, recently constructed across Northern and Western Ontario, has opened up for prospecting a large territory. Easy access to many promising areas is now available. Geological maps of some of these areas can be obtained from the Geological Survey, Ottawa.

The Canadian Northern Railway in Manitoba gives access to the Pas Mineral Area. In Alberta the Canadian Northern is serving important coal fields.

THE DEPARTMENT OF RESOURCES CANADIAN NORTHERN RAILWAY

The Department of Resources, Canadian Northern Railway Building, Toronto, will be pleased to furnish information about the districts served.

THE FLOTATION PROCESS

All patent and other rights to this process in North America are now controlled by

MINERALS SEPARATION NORTH AMERICAN CORPORATION

who is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 129,819; 94,516; 96,182; 96,183; 99,743; 127,397; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,608; 163,707; 163,936; 164,587; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603; 187,263.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES unanimously adjudged our basic patent for air-froth-flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision.

On May 4, 1917, in the UNITED STATES DISTRICT COURT OF MONTANA, the opinion of Judge Bourquin was filed in the case of Minerals Separation Ltd., and others against Butte & Superior Mining Company, and was followed by a decree on September 17, 1917, wherein it was adjudicated that the three claims which had been limited by disclaimer were valid and infringed, and that the seven claims adjudged to be valid by the Supreme Court of the United States were infringed. The acts thereby adjudged to be infringement included the use of mixtures of petroleum oils and mineral-froth-forming oils in a total amount exceeding one per cent. on the ore, and also the use of Callow pneumatic cells.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

On November 11, 1918, the SUPREME COURT OF THE UNITED STATES granted the petition of Minerals Separation, Ltd., and others for a Writ of Certiorari to review the decree of the United States Circuit Court of Appeals at San Francisco which had reversed so much of the decree of Judge Bourquin in the suit against Butte & Superior Mining Company as adjudged to be infringements those acts which employed oil of any kind or character used in excess of one-half of one per cent. on the ore.

Prospective users of our flotation processes are earnestly requested not to be influenced by the views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,116,103; Lode Gold, \$93,717,974; Silver, \$43,623,761; Lead, \$39,366,144; Copper, \$130,597,620; Other Metals (Zinc, Iron, etc.), \$10,933,466; Coal and Coke, \$174,313,658; Building Stone, Brick, Cement, etc., \$27,902,381; making its Mineral Production to the end of 1917 show an

Aggregate Value of \$595,571,107

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392.

Production During last ten years, \$296,044,925

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

Full information, together with Mining Reports and Maps, may be obtained gratis by addressing

THE HON. THE MINISTER OF MINES
VICTORIA, British Columbia

Just Why is the MARCY Grate?

The Marcy Discharge Grate has revolutionized Ball Mill practice.

The principle of the old ball mill was fundamentally right, but it took the Marcy Mill to turn the tide of popular approval completely in favor of the short-type Ball Mill as the cheapest and best method of ore reduction for cyanidation, flotation, amalgamation, concentration, etc., and it was the Marcy Grate that did it.

There are, to be sure, other things which contribute to Marcy efficiency, but without its patented grate the Marcy would simply be "another" ball mill.

Now, just "why is the Marcy Grate?"

Why does it contain so many slotted openings, running from the periphery of the mill to a point near the center?

The grate is intended to hold back the coarse ore and balls and allow the fines to escape. A small head of water carries the

fines through the slots and away from the grinding zone practically as fast as they are produced.

The small head of water makes a thick pulp, which greatly increases the mill's grinding capacity because of the ore particles which adhere to the balls. If need be, the pulp may be so thick as to scarcely run down a steep launder.

On account of the discharge at or near the periphery of the mill, the mineral and gangue have an equal chance to escape. There is no segregation of coarser mineral particles in the mill.

All this means little slimes because of the short time in which ground material stays in the Marcy Mill.

Capacity 4 to 1,000 tons per day depending upon the size and crushing conditions.

It means ONE EASY STEP, from crusher product to material for concentration, flotation, etc., with the minimum of oversize.

Ontario's Metal Production, First Nine Months, 1918 . . . 402

British Columbia's Coal Output 404

Personal and General 405

Special Correspondence 406

Markets 411

When Hon. Martin Burrell, Minister of Mines in the Dominion Government, was in British Columbia recently a delegation of Vancouver Island residents waited on him with regard to the interests of settlers interested in the coal rights of the Island. They wanted some statement from the Minister as to whether, should the British Columbia Government re-enact the Settlers' Rights Act of 1917, the Federal authorities would refrain from disallowing it again. Mr. Burrell could make no definite statement, but assured his petitioners that he appreciated the importance of the matter from the viewpoint of the settlers, involving as it did title to a considerable proportion of the coal resources of Vancouver Island. He agreed that all those interested were entitled to the fullest hearing by the Dominion Government should the matter come up for reconsideration. The Settlers' Rights Act, it may be explained, gave the settlers within the E. & N. Ry. Belt a specified period in which to make claim to the coal rights within the limits of their property, they then being granted title to the coal, if able to substantiate their claims. The coal areas in question, or at least most of them, now are owned by the Canadian Collieries (D) Limited.

THE CANADIAN MINING INSTITUTE

We are pleased to publish in this issue the letter of Mr. F. W. Gray on the functions of the Canadian Mining Institute. Mr. Gray well presents the ideas of those who believe there is, or should be, a wall between engineers and other members of the Canadian Mining Institute. We do not agree with Mr. Gray; but we can assure him that there are many, both within and without the Institute, who do.

Our opinion is that the main purpose of the Canadian Mining Institute is, and should be, the development of the mining and metallurgical industry of Canada. We believe that the majority of the men best qualified to carry out this purpose are technically trained men; but we believe also that certain non-technical men are just as fully qualified. We do not agree with Mr. Gray that mining engineers should cut themselves off from other men in this work. We believe that the strength of the Canadian Mining Institute lies in the fact that it is a great factor in working out the problem of applying science to industry, and we believe that a purely professional society would not be as successful in this work as is a society, largely composed of technical men, but also including non-technical men who hold positions of responsibility in the mining and metallurgical industry. Surely we have had a sufficiency of the exclusiveness of scientific societies. Those who wish to better the position of the engineering profession defeat their own ends when they divorce themselves from the industry which they serve.

Mr. Gray says: "If it had been intimated to us that we were affiliating with a trade association and not with a technical and professional society, we should not have dreamt of an affiliation." His words imply the belief that a society cannot be a successful technical and professional society and at the same time take an active part in the development of one of Canada's foremost industries. The very existence and success of the Canadian Mining Institute is a refutation of this idea. As a technical and professional society the Canadian Mining Institute is second to none. It is more successful than most such societies because it has not divorced itself from the industry. It is certainly not a "trade association," as that term is generally used, and yet it takes an active interest in many matters affecting the mining and metallurgical industry, besides purely professional matters.

The Engineering Institute of Canada is essentially a professional society. Many civil, mechanical and electrical engineers cannot attach themselves so closely to one industry as can mining engineers, metallurgists and geologists. They do the best they can under the

circumstances. It is obviously necessary to have some society for engineers who cannot find opportunity for intercourse and united effort in a society devoted to one industry. The Engineering Institute of Canada fills this need. It is naturally the largest engineering society in Canada and it is doing very useful work. Mining engineers have in the Canadian Mining Institute an organization which gives them the advantages of such a professional society and at the same time confines its attention to the industry with which they are most concerned, and does not exclude taking a part in non-professional matters affecting the welfare of the mining and metallurgical industry.

The Canadian Mining Institute is a technical and professional society, but it is more than that. It is an Institute that recognized years ago, what the English-speaking world has recognized more particularly during the past few years, that science and industry should be closely linked together and that technically trained men are of more use to the community when they refuse to set themselves apart.

The mining and metallurgical industries in Canada as in the United States, owe a great part of their success to scientifically trained men. It is natural that in an Institute that exists for the purpose of developing Canada's mining and metallurgical industry, technically trained men should predominate. Because they do, the Canadian Mining Institute is a strong technical and professional society as well as an organization which is able to do much that professional societies cannot do.

Among the members of the Canadian Mining Institute are many non-technical men who are taking a leading part, along with technical men, in the direction of mining and metallurgical enterprises. Far from believing that this is a source of weakness to the Institute, we believe it to be a great source of strength.

During the past few years there has been much said and written of the necessity of greater application of science to industry. In the mining industry we have been particularly fortunate in having made considerable progress along this line. The very character of the Canadian Mining Institute is an evidence of this. We believe that to make of the Canadian Mining Institute an old-style professional society would be a retrograde movement. We need not only advancement in learning among technical men, but also more rapid application of learning to industry. The first step is obviously to keep those who are responsible for the policies of mining and metallurgical companies in close touch with advances in science. In an Institute which includes non-technical as well as technical men, we have something that is far more valuable than a mere professional society; and we have the professional society also.

Mr. Gray says that he "resents and will resist any attempt to belittle our technical status." So will we all. But we do not agree with Mr. Gray's implication that we belittle the technical status of an engineer when we claim that an Institute which includes non-

technical men as well as technical men is of more value to the mining and metallurgical industries than would be a society composed wholly of technical men.

COMMISSION WILL INVESTIGATE CONDITIONS IN THE CROW'S NEST COAL FIELD.

The appointment of a Royal Commission to investigate conditions in the Crow's Nest Coal Field now is occupying the attention of the parties to the recent strike. The mines of Fernie and Michel, B.C., are in operation again after an enforced idleness of some thirty-five days, the men having been granted their demand for a Single Shift, or one shift in twenty-four hours. With this concession, however, was coupled the condition that an inquiry should be instituted having in view the establishment, or otherwise, of the men's claim that there is greater danger to the life of the worker through the use of the Double Shift than there is under the system now adopted. It also was understood that the Commission would be appointed immediately and that it would prosecute its inquiry with the utmost diligence in order that the report might be available in the shortest possible space of time. The Commission is to work under authority of the Provincial Government, its personnel to consist of a representative of the miners, one of the company, and a third, the chairman, to be selected by the Minister of Mines.

The re-opening of the Fernie-Michel Mines under the new order necessitated some re-organization, as can easily be understood. Mr. J. O. Jones, advisor to Mr. W. H. Armstrong, Director of Coal Mine Operations in District 18, and Mr. Robert Livett, International Representative of the U.M.W. of A., accompanied representatives of the management of the colliery on an inspection trip of the mines as soon as the men had voted to go back to work. They went through all the working places which the company contended were in the development stage, and therefore under the terms of one of the details of the settlement agreement, not open to the application of the single shift principle. Over thirty of these places were in dispute but, finally almost all were unanimously classified, those upon which it was impossible to reach an agreement being referred to Mr. Armstrong for decision.

GRANBY PRODUCTION OF COPPER IN NINE MONTHS

The copper output of the Anyox and Grand Forks smelters of the Granby Consolidated Mining & Smelting Co., for the first three-quarters of 1918, that is to say, up to the end of September, was 29,081,635 lb. This is a very satisfactory showing in comparison with that of last year when Anyox produced 27,661,301 lb. and Grand Forks 6,858,718, a total of 34,520,019 lb. Thus, with three more months to count, the Granby Company is within 5,438,384 lb. of its mark set in 1917, and if output is continued at the rate of 9,693,878 lb. a quarter, which has been done up to date, the 1918 production from the British Columbia smelters of this company will be 4,255,494 lb. in excess of that of the previous year. As the Ladysmith Smelter, which was operated intermittently during the year and now is closed down, produced 96,212 lb. of copper and no report is yet available as to what is being done by the Consolidated Mining & Smelting Co. of Canada, or what its aggregate may be expected to be, the indications may be put down as most promising; in fact, the belief is that British Columbia's total copper output at the end of 1918 will be found to be easily equal and possibly well in excess of that of 1917.

The Functions of the Canadian Mining Institute.

The Editor of the Canadian Mining Journal:

Sir,—Your editorial of the 1st November commenting on the relations between the Canadian Mining Institute and the Engineering Institute of Canada, correctly points out that failure to recognize the proper functions of the two societies has been responsible for past misunderstandings, and that if the members were more familiar with the nature of their respective societies, co-operative effort to improve the status of the engineering profession would be found not only desirable, but easy of accomplishment.

At the same time, speaking for the members of the Canadian Mining Institute resident in Nova Scotia, and in particular for the members of the Mining Society of Nova Scotia—a body that includes within its membership a number of members of the Engineering Institute of Canada—the writer desires to protest most emphatically against your opinion that the Canadian Mining Institute represents an industry, in contradistinction to the Engineering Institute of Canada, which it is contended represents a profession.

Recently the Mining Society of Nova Scotia voted to affiliate with the Canadian Mining Institute, but we can assure you that if it had been intimated to us that we were affiliating with a trade association and not with a technical and professional society, we should not have dreamt of an affiliation. We had not thought, nor did we ever expect to think, that the Canadian Mining Institute has as its chief aim the development of the mineral resources of Canada. The object of the Institute, as it has been generally understood by its members, is to provide a medium for the reading of technical papers, the dissemination of technical knowledge, and the practice of mining as it has been improved from year to year by the actual experience of its members in mining operations and prospecting. The connection between these objects and the development of the mineral resources of a young country like Canada is naturally so intimate as to be inseparable, and it has been a necessary concomitant that pioneers of the mineral industry—not necessarily technically trained men—should have been prominently associated with the Canadian Mining Institute. Nevertheless this fact does not lessen in any way the claim of the Institute to be as truly a technical and professional society as, for example, the Institution of Mining Engineers in Great Britain or the American Institute of Mining Engineers.

The time had probably arrived—was perhaps overdue—for the Canadian Mining Institute to adopt the stricter classification of its new members into fully qualified technical members and associate members that is customary in technical societies, but the retention of full membership by those older and valued members of the Institute who do not claim technical qualifications should not be any source of offence to the Engineering Institute of Canada.

On the other hand, it is open to grave doubt whether the Engineering Institute of Canada has improved its own status or the future prospects of the engineering profession in Canada if it has conceived the slightly grandiose and impractical scheme of combining in one society all the ramifications of the engineering profession. The profession of the civil engineer is wide enough and honorable enough in itself not to require

enlargement, and it discloses some narrowness of viewpoint to conceive that any one society can hope in the years to come to comprise within its scope the varied and at the same time severely specialized activities of the civil, railroad, mining, electrical, mechanical, chemical and steel-works engineers of the Canada that is to be; not to mention the extension of the engineering profession into the textile, shipbuilding and other industries that will occur to those who desire to follow the engineer into all his occupations. It may well prove to be that this conception will act as a limiting factor and a source of hindrance to the best interests of the engineering profession in future years.

The conception of a society that would co-ordinate the activities of all the engineering bodies, while allowing complete autonomy and individual independence to the several technical associations of Canada would seem to be a more judicious and proper arrangement than the absorption of the existing societies by one dominant society, and it would also be more likely to achieve a permanent career of usefulness.

If the conception of the Engineering Institute of Canada is merely as your editorial states, to “improve the status of the engineering profession,” it would seem to be a rather selfish ideal, and not in its essence distinguishable from trades unionism. The old-fashioned idea of a technical society was that it existed for the advancement of learning, and if it is in the minds of any member of the Canadian Mining Institute that the Institute represents an industry; or if it is in the minds of the members of the Engineering Institute of Canada that the Institute exists only to improve the status of the engineering profession, many people would feel inclined to agree with you in asking, “Would it not be well for each Institute to undertake to make the members of the others more familiar with the nature of the respective societies?”

It does not appear to have occurred to the Institution of Civil Engineers in Britain to criticize the rules of the Institution of Mining Engineers, and such action would be bitterly resented. The profession of the Mining Engineer calls for a severity of studies and for a breadth of scientific requirements that justify mining engineers in believing themselves qualified to manage their own affairs and to maintain their own technical societies without interference from other bodies, nor is it necessary for any mining engineer in Canada to belong to any other association than the Canadian Mining Institute and its affiliated societies, to enable him to claim the status of an engineer.

The Nova Scotia Mining Society is one of the oldest technical societies in Canada. Its membership is almost exclusively composed of technical men daily practicing their profession, but we have never considered the Society represented the mining industry in the province except as a body of engineers associated closely with that industry. We resent, and shall resist, any attempt to belittle our technical status. “The Canadian Engineer,” commenting editorially on your remarks of the 1st November, quotes Professor Haultain’s dictum that the Canadian Mining Institute “could never be absorbed completely by the Engineering Institute because its membership included many men who could not qualify for the Engineering Institute.” We have no intention of being “absorbed,” and presumably we shall be consulted, because if not, then our critics should in honesty choose some other word than “absorption” to describe their intentions.

Yours, etc., F. W. GRAY,
Editor, Mining Society of Nova Scotia.

ONTARIO'S METAL PRODUCTION FIRST NINE MONTHS, 1918.

Returns received by the Ontario Bureau of Mines from the smelters, refining works and metalliferous mines of the province for the nine months ending September 30th, 1918, are summarized in the table below, which, for purposes of comparison, gives figures for the corresponding period of 1917:

Product.	— Quantity —		— Value —	
	1917.	1918.	1917.	1918.
Gold			\$ 6,754,535	\$ 6,875,766
Silver, ounces	15,236,002	13,145,596	12,001,875	12,500,980
Cobalt, metallic, lbs.	295,866	317,291	433,739	702,717
Copper, metallic, lbs.		359,713		79,137
Nickel, metallic, lbs.	166,921	582,992	67,499	
Nickel oxide, lbs.	10,831	5,592	3,025	1,731
Cobalt oxide, lbs.	276,769	397,728	323,162	572,845
Other cobalt and nickel compounds, lbs.	276,217	367,923	30,025	53,784
Molybdenite, lbs.	65,827	43,631	83,550	54,671
Lead, pig, lbs.	1,080,000	1,291,571	139,948	115,117
*Nickel in matte, tons	31,064	33,508	15,532,000	20,105,087
*Copper in matte, tons	15,928	17,052	6,371,200	6,820,785
Copper ore, tons	2,658	16	33,419	318
Iron ore, tons	138,808	154,243	559,099	697,839
Pig iron, tons	513,232	541,564	9,841,438	14,728,461

*In 1917 nickel and copper in the form of matte were valued at 25 and 20 cents per pound respectively. For 1918 the values have been placed at 30 cents for nickel and 20 cents for copper.

Gold.

Gold production has been well maintained for the period, considering adverse war conditions which have been aggravated rather than improved during 1918. The signing of the armistice on November 11th will have the effect of releasing men almost immediately from munition plants and this will tend to relieve the labor shortage from which the mining industry as a whole has suffered. The value of the output, \$6,875,766, exceeds that for the corresponding period in 1917. This was produced from 711,185 tons of ore milled. In addition, 65,939 ounces of silver, worth \$64,029, were recovered. Hollinger and McIntyre continue to be the largest producers, the output respectively being valued at \$4,685,586 and \$1,206,875. New producers this year include Davidson at Porcupine, Patricia at Boston Creek and Lake Shore at Kirkland Lake. From the last mentioned, since milling operations started in March, 11,253 tons of ore were treated with a recovery in gold and silver of \$271,265, or \$24.10 per ton. At Boston Creek a new find of gold telluride on the Miller Independence has attracted a great deal of attention to this camp.

Silver.

Despite a decline in ounces produced, the output of silver for the first 9 months of 1918, if maintained for the balance of the year, will probably equal in value that of any other year in the history of the Cobalt camp. The average New York price of the metal for the period was 95.21 cents per fine ounce, the present price of silver being 1.01½. Mines shipping 750,000 ounces or over are given in order: Nipissing, Mining Corporation of Canada, Kerr Lake, O'Brien. Shippers this year to date include mines that have been idle for some time. Some of these are: Edwards & Wright, Ltd., operating the Green Meehan at North Cobalt; the Silver Eagle and Keeley mines, in South Lorrain, and Peterson Lake. Many of the mines are now treating slimes and tailing dumps by flotation methods.

Nickel-Copper.

The only copper ore shipment was a trial lot by the Hudson Copper Co., of Havilah. High operating costs, increased freight rates and smelter charges, and lack of a customs smelter within the province contribute to make copper mining unprofitable at the present time. As a result of the operations at the new Port Colborne refinery of the International Nickel Company of Canada, there was a production of metallic nickel and copper from nickel-copper matte. The refinery started last July, and up to the end of September had produced 358,205 lbs. of nickel and 359,713 lbs. of copper. The Copper Cliff and Coniston smelters treated 1,141,089 tons of ore, producing therefrom 64,926 tons of matte containing 33,688 tons of nickel and 17,232 tons of copper.

Iron Ore and Pig Iron.

During the first nine months of this year 154,243 tons of iron ore were shipped. Of this total, 84,886 tons were shipped to Ontario points and 69,357 tons outside the province. In addition to the output of the Algoma Steel Corporation and Moose Mountain, Ltd., shipments were made by the Poe Mining Co. from Palmerston tp., Frontenac county and by the Canadian Union Iron Mines Corporation, from Drummond township, Lanark county.

Pig iron production came from 1,083,456 tons of ore smelted, of which only 87,106 tons were of Ontario origin. Although the tonnage of pig iron produced was only slightly in excess of the 1917 figures, the value shows an increase of nearly 50 per cent. Eight furnaces were in blast, operated by four companies. The steel production was 668,333 tons worth \$21,601,144. As a result of the war's ending, the character of the output will be changed almost immediately from shell steel to structural steel and rails.

Lead.

Production of pig lead was in excess of the 1917 output but a decline in price is reported. The only mine and smelter operating is that of the James Robertson Estate at Galetta, on the Ottawa River. The entire product is shipped to the headquarters of the company at Montreal.

Molybdenite and Ferro-molybdenum.

The output of molybdenite concentrates shows a decrease. Molybdenum is one of the war metals, and as a result of the armistice the demand has declined. Early in the year the International Molybdenum Co., of Orillia, and the Tivani Electric Steel Co., of Belleville, produced ferro-molybdenum to the extent of 19,410 lbs. worth \$59,153. Electric Foundries, Ltd., of Orillia, produced in experimental work 1,800 lbs. of ferro-manganese. This last-mentioned company and the Tivani company are now engaged in the electric furnace production of low phosphorus pig iron.

GRANBY HONOR ROLL.

In honor of the 400 or more men of the Granby Mining & Smelting Company, who have joined the allied forces, the Granby Company is preparing an honor roll to perpetuate their memory. The tablet, which is a handsome work of Corinthian design in fumed oak, standing over four feet high, is to be placed in the company's Vancouver office. It will be suitably framed and colored photographic enlargements will be on view at each of the company's plants. The scroll at the top of the cornice shows the Union Jack, Canadian Ensign and Old Glory entwined with a Maple Leaf in the centre, all brought out in colors. A large inset picture in the centre of the tablet by the English artist, Herbert Schmatz, entitled "Banners of Empire," depicts the Canadian Regimental Flags lying on General Wolfe's tomb in Westminster Abbey, while the men are fighting in France. Beneath the picture is a glass cabinet containing the honor roll, a dark green morocco-bound book divided into six sections, representing the company's six plants at Anyox, Alaska, Cassidy, Grand Forks, Phoenix, and the Vancouver office. A separate loose leaf bears the record of each individual, giving particulars of his name, family record, date of enlistment, history of his services with the company, his department, age, military record and battalion. Of the 400 or more Granby employees who have responded to the call, between twenty-five and thirty have been killed and nearly one hundred have received serious wounds.

LA ROSE ACQUIRES HOMESTAKE SILVER MINE.

The Homestake silver mine, one of the best-known old mines of British Columbia, has been sold to the La Rose Mining Company, of Cobalt. This is the second Cobalt mining company to enter the mining field of British Columbia recently, the Mining Corporation of Canada having recently acquired and now being engaged in the development of the Woolsey property near Revelstoke, B.C. The Homestake was disposed of by Mr. Byron R. Jones and associates, of Vancouver, who had secured the property under option. This mine was operating twenty-two years ago, but its owners at that time, a Vancouver syndicate, although its silver values were high, were unable, under the processes then in use, to extract more than a little over 70 per cent. For this reason the working of the property, having been found unprofitable, ceased. With the oil flotation process and the high price of silver, the Homestake

will be placed among the producers again, its new owners being convinced that, as a result of the changed conditions, it will prove to be a first-class investment. Mr. H. D. Cameron, a nephew of Sir Douglas Cameron, former Lieutenant-Governor of the Province of Manitoba, will be in charge of the work. The Homestake is situated in the Kamloops Mining Division of British Columbia, approximately 18 miles from the Canadian Northern Pacific Railway and at an elevation of about 2,600 feet. It consists of four Crown-granted mineral claims, of 191.44 acres. A tunnel 190 ft. in depth has been sunk.

Mr. Robert R. Hedley, a well-known mining man of Vancouver, B.C., is superintending the operation of the Mary Reynolds mine of Yale District. This is a gold-silver proposition and Mr. Hedley expects to arrange for the installation of a mill next summer. He looks forward to developing, in a short time, an output of between two and three carloads of ore a month.

Mr. James Errington has obtained an option on the group of claims known as the Aspen Grove Property, a low-grade copper proposition, which is situated in the Kamloops Mining Division, B.C. There are seventy claims in this group and an engineer has been engaged to make a report on the whole property. Drilling is expected to commence in the spring of next year.

One of the most important public works undertaken by the Mines Department of British Columbia with a view to opening up a promising mineral district to development is the construction of what is known locally as the Big Bend Road, which runs from the City of Revelstoke north along the Columbia River. The country in this section, generally speaking, is rough and mountainous and it has been and is (as the work is not yet finished) an expensive and, to the engineers engaged, a somewhat difficult work. The road now is open to La Forme Creek, in which locality are situated a number of mining prospects from which much is expected.

From the Chu Chua section of the North Thompson River, British Columbia, comes the report of another rich gold strike. A sample taken from the discovery was displayed at Kamloops, B.C., which, it is estimated, would run from \$25,000 to \$40,000 a ton in gold values. Henry Skenig is the locator. He is just back after spending a year at the claim. He says he has run a tunnel 87 feet and stripped the lead at points for about 12,000 feet, and has also run crosscuts at several points.

It is stated in Vancouver, B.C., that despite the efforts of the United States authorities at the border, American gold still is coming into Canada for barter and exchange, especially among the Chinese who pay as high as 35 per cent. premium for coinage. This, in turn, it is claimed, is shipped out of Canada to the Orient. During recent months the price for gold among the currency gamblers in the Oriental section of Vancouver has increased from 10 to 35 per cent. It is said that large sums of gold are held in Chinatown awaiting the opportunity of shipment to China. One man who has sold considerable coinage to Chinese speculators is said to have made the statement recently that several months ago he got only \$22 for a \$20 gold piece but now he could get \$25.50.

BRITISH COLUMBIA'S COAL OUTPUT.

A statement prepared by the Provincial Department of Mines, showing the coal production in British Columbia for the first nine months of 1918 is of special interest because of the special efforts made to maintain a high output notwithstanding many and unusual difficulties. The figures issued show an aggregate increase of 255,188 tons; not very considerable when viewed from the broad standpoint of American production, but, to the operators concerned, very satisfactory because it has been accomplished in the face of problems which appeared insuperable at the moment but each of which has been successfully dealt with. Of course, the scarcity of labor has been a factor which has confronted the collieries ever since the war started and costs also have been steadily advancing. But it was not alone these that the operators of Vancouver Island were called upon to overcome. They found that in some cases their most reliable workings were becoming exhausted and had to develop new mines to take their places. And there have been, and are, other difficulties, as will be shown.

The Canadian Collieries (D), Limited, found it necessary to abandon No. 4 Mine Extension comparatively early in the year. This, however, was not allowed to interfere with production any longer than could be helped. It was decided to open a new mine, No. 5 South Wellington, which has been on the shipping list for some time and is making a good showing.

The Pacific Coast Collieries Co., Ltd., had to close Nos. 1 and 2 Slopes, South Wellington, but it concentrated on Nos. 3 and 4 Shafts, Morden Mine, which have been doing exceptionally well.

The British Columbia Coal Mining Co., whose Jingle Pot mine figures strongly in the output statistics for 1917, was closed by order of the Chief Inspector of Mines early in the year owing to the discovery of a fire which threatened to be serious. It remained sealed for months, representing a very serious loss to the Island output. However, it now has been re-opened and its daily tonnage is advancing steadily.

If there had not been something to offset all this the figures given at the outset would be impossible. There have been, fortunately, compensating features, one of the most notable perhaps being the splendid production of the Harewood Mine, Canadian Western Fuel Co., as well as the very satisfactory manner in which the operation of the No. 1 and Reserve Mines, of the same company, has been speeded up. Then there have been additions to the ranks of the collieries, some of which already have begun to count and others of which still are in the development stage. These include the Granby Consolidated Mining and Smelting Co.'s mine at Cassidy's, V.I., which promises to be one of the finest coal mines of Western Canada in point of plant and general equipment and which is materially swelling the monthly production statistics. Also, there is the new Wakesiah Mine, Canadian Western Fuel Co., at Nanaimo, which is expected to be in operation in the course of a few weeks and the output capacity of which is placed, by conservative estimate, at 150,000 tons per year. Its development will represent an expenditure of about \$200,000. The Nanoose Collieries, also, is doing some development which will have an important bearing on the productiveness of the Vancouver Island fields in the future.

Details of the output for the first three-quarters of 1918 follow

Island Fields: 1917, 1,275,147 tons; 1918, 1,277,847 tons. Increase, 2,700 tons. Crowsnest Fields: 1917, 350,180 tons; 1918, 572,010 tons. Increase, 221,830 tons. Nicola-Princeton: 1917, 106,158 tons; 1918, 136,816 tons. Increase, 30,658 tons. Total increase, 255,188 tons.

It will be noted that the most marked increase was in the Crowsnest, which is explained by the fact that the mines of Fernie, Michel, Corbin, etc., worked constantly, turning out a steadily increased tonnage, until the strike occurred over the introduction of the Single Shift System in the two former mines. As the labor trouble of 1917 in this district took place early in the year the difference is clear. If there had been no Single Shift Strike, there would have been a further increased tonnage of at least 60,000 tons. As it was, the September returns showed a slump of 75,777 tons over those of August. Another contributory cause for this was the Nanaimo cable accident.

It may be remarked incidentally that the Royal Commission to be appointed to make inquiry into the necessity for the Single Shift in Fernie and Michel has not yet been named, because the miners have been unable to nominate their representative. The inquest into the circumstances of the death of the Nanaimo miners is still in abeyance. The latter awaits the report of Provincial Mineralogist W. Fleet Robertson, who went to McGill University with parts of the broken cable to carry out a series of physical, chemical, microscopic and other tests with a view to revealing the cause of the accident. From Montreal comes the report that the fracture shows that, while the outside strands of the rope were flawless and apparently as strong as ever, the centre or core for a certain distance had been affected by rust. The origin of this rust and the reason of its localization to a limited length of the rope where the fracture took place has yet to be explained.

To revert to the question of production, there now is some speculation as to what the returns for the remainder of the year will show. While all the October figures are not to hand, enough have been received to show that that month cannot be expected to make a particularly good comparative showing. The ravages of Spanish influenza have been felt by the miners of British Columbia to a greater extent than workmen in other lines of activity. It is known that the Canadian Western Fuel Company's output for October was 59,219 tons. This was for 27 working days. Compare that with 61,200 tons for September in which there were 25 working days and the effect of the "flu" to that particular colliery is apparent. It has made a difference of approximately 300 tons a day. The same conditions prevail at Fernie, where the production, normally 2,500 tons daily, is reported to have dropped to 500 tons a day. Michel, it is said, escaped the disease to a large extent by becoming a closed town, trains passing through with locked doors and no strangers being allowed ingress.

However, with the "flu" checked, which should soon be accomplished, conditions now are fairly propitious and British Columbia may wind-up the year 1918, after all, with a good margin over the preceding year in respect of coal output.

The Telkwa Coal Basin.

Some of the coal deposits of Northern British Columbia are being developed, that which now is receiving attention being the Telkwa Coal Basin, situated about 35 miles from Telkwa on the line of the Grand Trunk Pacific Railway. Three drill holes have been

sunk and, according to the engineer's report, it has been established that there are 50,000,000 tons of good bituminous coal available in this particular section. Experiments seem to indicate that it will prove to be good coking material, but the coal has not yet been given a practical trial. The most serious difficulty confronting the promoters is the question of transportation, the construction of a branch line connecting with the G.T.P. being necessary. This is a matter which is being dealt with now, and if the financial support necessary for the work is secured, this coal will be exploited.

DECISION IN FAVOR OF COAL OPERATORS ON VANCOUVER ISLAND.

The British Columbia Court of Appeal has handed down judgment in favor of Mr. H. W. Treat and his associates as against the E. & N. Railway Co., in the suit brought by the latter to have the defendants—Messrs. Treat et al—declared trespassers on certain coal-bearing lands on the foreshore of that block of land known as the E. & N. Land Belt, Vancouver Island. This confirms the opinion of the lower court and affirms Mr. Treat's title to the lands in question, which are situated near the mouth of the Chemainus River between Victoria and Nanaimo, B.C. It means that the courts hold the view that the Dominion Government had no power to convey foreshore rights to the railway company when bonusing it, by a considerable land grant, for the construction of the road. It means, also, that the development of the coal in question will proceed without interference and that others, holding provincial licenses to coal areas on the foreshore of the island and within the belt, probably will take steps leading to the development of this part of the coal resources of the island.

The Canadian Northwest Steel Company is building a fuel pulverizer, on plans prepared by the Fuller Engineering Company, for the B.C. Sugar Refinery of Vancouver, B.C. It is expected to cost about \$40,000. This is the first installation of the kind in the Canadian West and for that reason is being viewed with special interest.

ASPEN GROVE AMALGAMATED MINES.

The Aspen Grove Amalgamated Mines, Ltd., of British Columbia, has been formed for the purpose of taking over and operating several large groups of mineral claims in the Aspen Grove District. The property includes sixty claims and has been developed sufficiently to satisfy those interested that they have a splendid deposit of copper. Considerable work is contemplated which, it is stated, will commence at an early date. The officers are: J. A. Bate, president; M. A. Durland, secretary-treasurer; M. L. Grimmett, director and solicitor; Joseph Walters and Dr. J. J. Gillis, directors. The company's headquarters are at Merritt, British Columbia.

PRINCETON MINING AND DEVELOPMENT COMPANY.

A considerable body of ore is blocked out on the property of the Princeton Mining & Development Company near Princeton, B.C., and as a short spur from the Great Northern Railway has been completed shipments to the Granby Smelter at Grand Forks will start without loss of time. It is the intention to work continuously. Assays of the ore average about \$35 to the ton.

DEVELOPING PRODUCER SILVER-COPPER PROPERTY NEAR JEDWAY.

Energetic measures are being taken for the development of the Producers' Mine, a promising silver-copper property situated on Moresby Island near the town of Jedway. Water power is being provided, a ten-inch water pipe driving a 48-in. Kincaid waterwheel. A compressor plant has been imported from Vancouver City. It is proposed driving a 250-ft. tunnel to tap the vein and, if the programme now laid out is carried through, the mine will be on the shipping list by February, 1919. Mr. Frank Buckingham will have charge of the mine operations.

PERSONAL AND GENERAL.

Mr. J. B. Tyrrell has been elected chairman of the Toronto branch of the Canadian Mining Institute.

Dr. R. C. Wallace, Commissioner of Northern Manitoba, is moving from Winnipeg to The Pas, Manitoba, where he assumes his new duties on December 1st.

Mr. E. V. Neelands is in Toronto.

Mr. Charles Williams, of the Hollinger staff, was in Toronto last week.

Mr. J. L. Agnew is suffering from an attack of influenza.

Mr. H. E. Rice has been appointed general superintendent of Dominion Iron and Steel Co.

Mr. A. D. Miles, president of the International Nickel Co. of Canada, is now in the new offices in Toronto.

Major E. F. Pullen has been awarded the Distinguished Service Order Medal.

Lieut.-Col. R. W. Leonard has been elected president of the Engineering Institute of Canada for the coming year.

Mr. R. N. Palmer is at Black Lake, Que.

Major T. R. London has been appointed Commander of the Royal Canadian Engineers in Military District 11, which includes British Columbia and Vancouver Island.

Mr. Chas. Randall has been appointed manager of the Dome Lake Mining Co., Porecupine.

The bulletin on the Radial Coal Cutter, just issued by the Canadian Ingersoll-Rand Company, Ltd., describes the "37" and "47" coal cutters manufactured by that company. The bulletin describes the details of construction and indicates the particular advantages of this type of coal-cutter; briefly, these are the portability and ease of operation, with first cost comparing favorably with that of the standard rock drill. One of the principal features of the machine is the variable stroke, which has been found to be essential for this class of work.

Mr. Thomas Graham, superintendent of the Canadian Collieries (Dunsmuir), Ltd., states that the ravages of the epidemic of Spanish influenza have severely handicapped him in his endeavor to maintain the output of the several mining properties of that company. He asserts that the number of men who have laid off work for periods of varying length during the past few weeks runs into the hundreds. It has been impossible, therefore, to keep production up to the maximum point during the first weeks of November. However, he is hoping that an improvement soon will be apparent.

SPECIAL CORRESPONDENCE

NORTHERN ONTARIO.

The Otisse Property, Matachewan.

The results of diamond drill work done on the Otisse property in the Fort Matachewan district have been satisfactory. This announcement was made authoritatively. So far as can be reasonably ascertained, diamond drilling has indicated the presence of a large body of mill ore. In all, thirteen holes were sunk on the property, which was staked by Sam Otisse and optioned by the Colorado-Ontario Development Company less than a year ago. The results of the first few holes drilled did not prove very satisfactory, but as work progressed, better results were obtained. Operations at the property have now been suspended, pending the arranging of the installation of a mining plant. This will not be attempted until the winter roads are available for hauling supplies to the new district, owing to the fact that freight at the present time costs the exorbitant price of \$90 per ton from Elk Lake, the end of the steel, which compares with a cost of about \$15 per ton over the winter roads. A new \$4,000,000 company has been organized for the purpose of active operation of the property. This is to be known as the Matachewan Gold Mines, Limited. Associated with the new company are the original members of the Ontario-Colorado Development Syndicate, among whom are Charles Flynn, of New York, and C. A. Foster, together with Walter J. Boland, of Toronto.

Camp buildings have been erected on the property sufficiently large to accommodate a large force of workmen. A land road has been cut to within about six miles of Elk Lake, and the remaining six miles can be cut in a short time, thus furnishing satisfactory communication with Elk Lake for the winter months at least. Owing to the fact that the greatest amount of work on any one property in the district has been accomplished on the Otisse, it has formed the centre of interest for the new camp. The Davidson property, which adjoins the former, is the first on which gold discoveries were made in the district, but up to the present it has not been extensively opened up. It, therefore, appears to be evident that the future of the Matachewan area to a large extent hinges on the results met with in the future development of the Matachewan Gold Mines, where ore has been indicated and awaits the actual underground development to prove its extent and importance. Several hundred mining claims have been staked in the district and a considerable amount of surface work has been done by various property owners, therefore the announcement of results achieved in diamond drilling and the assurance of further development work on the leading property in the new gold area will prove a source of much satisfaction to the many property holders.

The Gowganda Road.

Road construction between the end of the railway at Elk Lake and the Gowganda Mining camp has been suspended for the time being. Limited labor, coupled with extremely wet weather, retarded the progress of the work a good deal, in spite of which fact, however, a part of the road has been put in pretty fair shape. The results of mining in the district during the coming winter may be expected to determine to what extent the government will devote its energies to road-building in that district during the coming summer. With the cessation of hostilities, it is expected larger num-

bers of men will be available for this class of work in the future.

Elk Lake Expects a Boom.

Indications point to Elk Lake being the centre of much activity during the coming winter months. In addition to the increased activity in mining circles in the Elk Lake district, operations under way in the Gowganda camp, coupled with indications of another busy winter in Matachewan, provide the reasons for the expected boom. Elk Lake as a silver mining section had the misfortune to be discovered at the time when Cobalt was just nicely under way as a silver camp, with its excellent railway connections. In spite of the fact that some very spectacular shoots of high-grade ore were encountered in a number of places, no real paying mines were developed. However, mining methods have been greatly improved over those prevailing a decade ago, and it is possible that with the added knowledge of geological conditions and better methods of treatment, a number of mines may yet be developed. The Elk Lake field is located some forty miles north-west from Cobalt and the rock formations resemble those of Cobalt with the one exception that the diabase formation predominates. Some conglomerate occurs, but in less extensive bodies than in the Cobalt camp. It is a well-known fact that the largest percentage of silver produced in Cobalt came from the veins in the conglomerate. Exceptions to this rule have occurred, however, as in the case of the Kerr Lake Mine at Cobalt, where immensely rich veins have been found in the diabase. Invariably, however, these veins have been found in close proximity to the contact of the diabase and conglomerate formations. The present high price of silver is added incentive to the various property holders to more diligently search for the precious metal, and there is a strong possibility of their efforts resulting favorably in a number of cases.

A Silver Discovery.

A promising discovery of silver is said to have been made on the Westcott claims in the Township of Tudhope, Elk Lake District, not far from the Toledo property.

Shipping Ore From Foster Mine.

Steady shipments of ore are being made from the old Foster mines at Cobalt. About eight cars per week are being shipped to the Northern Customs mill. Arrangements are being made for increasing these shipments to twelve cars per week, from which it is expected about 4,000 ounces of silver per ton will be produced. During the removal of these dumps a considerable amount of high-grade ore is being encountered and already one carload, estimated to contain about 300 ounces to the ton, has been shipped. The ore is being handled by one man operating a mechanical bucket, and the costs of handling have been reduced to a minimum. In the meantime, underground operations are being carried on at the first level of the mine.

Boston Creek.

Efforts are being made to have the "National" stop at Boston Creek Station. The present passenger service to the new camp is somewhat inconvenient, owing to No. 47 train only running as far as Englehart, necessitating travellers stopping over at Englehart or some point along the line until the arrival of the Montreal train late in the afternoon. This brings passengers to Boston Creek in the evening, making it necessary to make the trip to the outlying mines after night-fall. The "National" passes through Boston Creek three days a week shortly after noon and would provide ex-

cellent service to passengers with this station as their destination.

Developments at the Miller-Independence Mines at Boston Creek are such as to arouse the greatest enthusiasm. The phenomenally rich ore being encountered is causing international interest. The calaverite, which is in spectacular quantities, occurs over a width of several feet. The pay-streak, in which the tellurides of gold occur in exceptionally large quantities, is from four to five feet in width, in addition to which there is from six to eight feet of high-grade milling ore. The management is carrying forward an aggressive policy of underground development, and drifts are being driven at both the 100 and 200-foot levels in two directions. It is also planned to diamond drill several hundred feet ahead of development work.

Will Develop Mondeau Property.

It is learned that the Timmins interests, prominent in mining circles through their connection with the Hollinger-Consolidated at Porcupine, are interested in the development of the Mondeau property in the McElroy township section of the Boston Creek mining camp. The Mondeau is situated in the northern part of what appears to be the richest belt in the Boston Creek district. It is equipped with a small mining plant, and present plans of operation call for the sinking of the shaft to a depth of 100 or 150 feet, for which work additional machinery is being installed. Lateral work will be undertaken at the aforementioned depths. A contract for shaft sinking has been let, and work is already under way. The entry of the Timmins interests into the Boston Creek camp is of considerable importance, showing that the district is looked upon favorably by the leading mine operators of the Dominion. The most important factor to date has been the extensive rich deposits developed on the Miller-Independence property. Evidence continues to accumulate from week to week, however, that the extent of the gold-producing area of the new camp will be large. Discoveries of more or less importance, and worthy of further development, have been made at widely-separated points in the four townships which comprise the Boston Creek gold district, namely: Boston, McElroy, Pecaude and Catherine. The camp is ideally located as regards railway transportation and power, and with sufficient men available for the energetic development of the large number of promising prospects in the district, rapid enlargement is looked for in the mining activities of the camp.

Pittsburgh-Lorrain.

Milling operations at the Pittsburgh-Lorrain property in the South Lorrain section of the Cobalt district have been suspended for the winter months. During the summer and fall the company has employed the oil flotation process with considerable success. The Pittsburgh-Lorrain owns and operates the old Currie property, and also the Wettlaufer mine and mill under lease. The operation of these properties have been the most consistent effort at silver mining in the South Lorrain district in recent years.

Temiskaming Mill Again in Operation.

Developments at the Temiskaming Mine in the Cobalt camp have recently been of a favorable nature. The new vein reported as having been encountered on the Gans lot is showing improvement as work proceeds. It is understood drifting is proceeding both north and

south, and the vein has a width of about one foot. The wall rock is said to carry silver values over the full width of the drift. The mill at the property, which has been closed since last spring, was placed in operation again this week, it being presumed that sufficient ore is now available to keep the plant operating at capacity for a reasonable period. The treasury of the company is in excellent condition, there being upwards of half a million dollars in cash available, in addition to which \$400,000 of the recent Canadian Victory Loan was subscribed for by the company.

Nipissing.

During the month of October the Nipissing Mining Company produced \$278,468, and shipped products from Nipissing and customs ore of an estimated net value of \$545,135. Favorable underground developments were encountered at shaft 73 and at 96 tunnel. A small vein which was encountered in 73 shaft in September, has improved from one inch in width to as high as three and four inches, assaying from 2,000 to 3,000 ounces to the ton. At 96 tunnel a crosscut encountered two soft veins about two inches in width and assaying 1,500 ounces. Elsewhere conditions underground continued to be satisfactory. A winze is being started at the sixth level of No. 73 shaft in order to explore and develop the southeast part of the northern portion of R. L. 401. A promising vein was encountered at the sixth level about two months ago, but it is apparent that more depth is desirable. It is estimated that the depth of conglomerate at that point will be at least 125 feet below the sixth level. The vein is strong structurally, and has other encouraging features. Construction work has been almost completed and sinking is now under way. A new shaft is being started near the centre of R. L. 404, near the edge of Cobalt Lake. There is a large area of undeveloped conglomerate in this vicinity. It is comparatively shallow in depth, however, and the shaft will have a depth not to exceed 125 feet.

A total of 125 tons of high-grade ore were treated, and the refinery shipped 401,423 fine ounces of silver. The low-grade mill treated 6,882 tons. The following is a summary of production:

Low-grade mill	\$120,987
Washing plant	157,481
Total	\$278,468

\$7,624,761 in Ten Months.

During the first ten months of the current year the mines of Cobalt have shipped silver of an approximate value of \$7,624,761. This compares with \$6,070,748 during a corresponding period of 1917, and represents an increase of \$1,554,013, or an average increase of upwards of \$150,000 every thirty days. At this rate the silver output of the camp will exceed that of the year 1917 by almost \$1,900,000. Even with the increased costs of operation, the profits of the various operating companies will be greatly swelled. The 1918 silver production in point of value will establish a record for the Cobalt camp, owing to the fact that the price of the white metal has been abnormally high during the year, as well as the fact that the known ore bodies of the larger producing mines of the camp are being found to extend beyond their previously known limits in almost every case. It is also possible

that new mines will be developed where energetic exploration work is being carried on at a number of properties in the camp. The North Cobalt area is receiving considerable attention at the present time. The installation of an electrically-driven mining plant is under way at the property of the Mining Corporation of Canada on the west side of the track at this place, and excellent results are attending the development of the Green-Meehan mine on the east side of the track. The Mining Corporation has outlined a somewhat extensive plan of operation. The fortunes of the mines of the camp will, no doubt, continue to fluctuate, as has been the case from the beginning. It is not improbable, however, that the working out of one mine may be followed by greater production from others, which will likely continue for a great many years.

Kerr Lake.

The production from the Kerr Lake Mine at Cobalt for the month of October amounted to 200,220 ounces of silver. This compares with 208,339 ounces during the preceding month, and is slightly lower than any previous month of the current year. With the price of silver remaining at slightly over \$1.01 per ounce it is evident the value of the output of the past month is higher than that of the earlier months of the year. The following is a summary of development for the past ten months of the year:

Month.	Ounces.
January	204,641
February	204,153
March	207,100
April	201,000
May	268,213
June	210,000
July	231,000
August	250,400
September	208,339
October	200,220

Temiskaming and Hudson Bay.

The annual meeting of the Temiskaming and Hudson Bay Mining Company, as well as the operating company, the Hudson Bay Mines, Limited, was held at New Liskeard on November 12th. George Taylor, who since the formation of the company has been president and director, retired on account of ill-health. The shareholders expressed regret at Mr. Taylor's retirement, and passed a hearty vote of thanks in appreciation of his long and valuable services as president of the company. The annual reports of both companies will be available in a few days.

The following directors have been elected: For the Temiskaming and Hudson Bay Mining Co., Ltd.—Messrs. A. A. McKelvie, T. McCamus, F. L. Bapst, C. L. Sherill, W. H. Kinch, S. S. Ritchie, and F. L. Hutchinson: Officers: President, F. L. Bapst; Vice-Pres., A. A. McKelvie; Sec.-Treas., F. L. Hutchinson.

Beaver Consolidated.

Continued favorable developments above the diabase sill at the Beaver Consolidated Mines, Cobalt,

are reported, and the expectation that plans are being completed for the opening of the large new mill at the Kirkland Lake Gold Mines, of which the Beaver Consolidated owns seven-eighths of the stock, is serving to attract attention in mining circles. While officials are reticent regarding achievements at the mine, it is understood that no work is being done at the 1,600-foot level, with the exception, perhaps, of pumps necessary to prevent the workings from flooding. Besides completing the purchase of the Kirkland Lake Gold Mines, the Beaver has equipped the mine with a 150-ton mill in addition to developing the ore bodies to a depth of 700 feet. Close to one million dollars in gold ore has been blocked out at this property, which will prove a big asset to the Beaver Company. This large gold mine, new, but proven, added to the Beaver Mine itself, which is still a large producer, lends big value to the Beaver Consolidated.

Rich Ore at Foster Mine.

One of the most notable developments in recent years in the Cobalt camp is the sensational results being met with at the 60-foot level of the old Foster property here. A few weeks ago, shortly after underground work was commenced, a high-grade vein was encountered in one of the old workings. Since this time the drift has been driven about 30 feet in ore, the vein being about three and a half inches in width, and in places carries massive silver, while the average grade of the ore is around five thousand ounces to the ton. In the wall rock leaf silver in chunks, sometimes as large as a man's hand, is found in the seams along the sides of the vein. Already a large amount of this high-grade ore has been bagged, while high-grade ore continues to show along the floor, in the face and roof of the drift. The property is being operated under lease by C. L. Campbell and W. Fairbairn of Haileybury. While the lease will doubtless result in the holders getting large returns, the Foster Company itself will not derive any great benefits from the new discovery, the lease calling for the company to receive but ten per cent. of the "profits" of the operation. Besides the successful working of the underground portion of the mine, the dumps are being sent to the Customs Concentrator at 104, and about 4,000 ounces of silver per week is being recovered from this source, while also a fair amount of high-grade ore has been found in the work of removing the old ore from the surface dumps.

Adanac.

The vein at the 310-foot level of the Adanac Mine ranges in width from 18 to 30 inches, and the silver values in the face of the drift range from 100 to 400 ounces to the ton. At the point where the vein was cut several weeks ago, the grade of ore was comparatively low. However, since drifting was commenced, a steady increase has been recorded, with assays of 395.60 ounces showing in the last few rounds. The composition of the vein is smaltite, niccolite, calcite and silver, the smaltite and niccolite constituting the greater percentage of the vein matter. A crosscut is also being driven to the east to cut the series of veins which parallel that along which the drift is being made. Early this week one of these veins was cut, in which considerable leaf silver occurs. The wall rock also contains visible lead silver. Altogether, the result of operations appears to be very satisfactory with excellent possibilities of early improvement.

Restakes Disputed Property.

The disputed ground along the boundary line of the Violet property of the La Rose and that of the O'Brien Mining Company, has been restaked by Mr. G. E. H. Booth of the La Rose Mining Company. This seems to point toward the belief on the part of Mr. Booth that the disputed ground is indeed outside the limits of the Violet Property of the La Rose and also that of the O'Brien Mine. The incident is unique in the history of mining in this country, in that, if the staking is in Mr. Booth's behalf, it would take from the La Rose (the company with which Mr. Booth is associated) a large part of their main workings on the Violet; or if the staking is for the company with which Mr. Booth is employed, the company is then staking its own shaft.

Schumacher Gold.

At a special meeting of the Schumacher Gold Mines, Limited, held immediately before the annual meeting of the company, a number of interesting statements were made by Mr. F. L. Culver, Vice-President of the company, who occupied the chair in the absence of the president. He said it was the intention of the management to sink the main shaft ultimately to the 1,000 or 1,200-foot level. The mill, he added, had a capacity of 180 tons per day, and a small addition to the machinery would readily increase this capacity to 300 tons. The Schumacher Mine is situated adjacent to the Hollinger Consolidated Gold Mines and the McIntyre-Porcupine. Extensive ore bodies have been opened down to a depth of 700 feet. The announcement that development to the 1,000 or 1,200-foot level had been decided upon by the management lends still further to the importance of the operation. The mill on the property is the third largest gold ore-treating mill in Northern Ontario. A by-law was passed authorizing the sale of 100,000 shares of treasury stock of the company at a discount of not more than 55 per cent.

Sittings Postponed.

Owing to the prevailing epidemic of influenza in this portion of Northern Ontario, Mining Commissioner T. E. Godson, K.C., has decided to postpone the sittings listed for hearing in Haileybury in December. The postponement will be until some time in January.

Ophir.

The Mining Corporation of Canada has notified the Ophir management that the option on their property by the former company will be dropped on the 14th of December next. It is stated that Ophir interests have made arrangements for continuing the work, as they do not consider the veins have been adequately tested.

Lake Shore.

In his regular monthly report to the directors of the Lake Shore Mines, Limited, at Kirkland Lake, Manager R. C. Coffey points out that the mill treated 1,875 tons of ore and recovered approximately \$45,000 in gold. Both the tonnage treated and the value of gold produced are a new record for the Lake Shore. The following is a summary of the development work for the month: 200-foot level—The crosscut on No. 1 vein was advanced from 160 to 180 feet east. The east drift on the No. 2 vein was advanced from 28 to 107

feet. A diamond drill hole was started south from the No. 2 vein and advanced to 252 feet. 400-foot level—The south branch of No. 1 vein east was advanced from 265 to 322 feet. The north branch of No. 1 vein west was advanced from 259 to 263 feet. At 270 feet on the south branch a crosscut was driven to connect up with the north branch, the distance being 19 feet. Work on the No. 2 vein east was carried from 296 feet to 386 feet, and a crosscut was driven 23 feet.

Hill Gold Mines.

It is understood that operations at the Hill Gold Mines, in the Painkiller Lake section of the Munroe Gold district, is making arrangements for the commencement of operations. It is also stated the company has succeeded in securing control of additional property adjoining. A mill was in the process of installation when the work was suspended.

Elliot-Kirkland.

It has been decided to continue the main shaft of the Elliott-Kirkland property to a depth of 600 feet. The results met with at the 500-foot level did not prove as encouraging as had been hoped, and after diamond drilling at this point it was decided better conditions existed at the 600-foot level than at the 500, and accordingly the shaft is to be continued to that depth.

Installing Mill at Burnside.

The work of installing the milling equipment at the Burnside property at Kirkland Lake is being rushed in the hope of placing the mine on a producing basis by the end of the current year. It is anticipated that with the ore already developed on the property, and the treatment of the material in the 25-ton mill will provide sufficient funds for the extensive enlargement of the milling plant, which present indications appear to warrant in the not distant future. With the prospect of shortly being able to secure all the labor necessary for carrying on operations at full blast, the mill is being completed at an opportune time.

Important Developments on Cotter Property.

Important developments are taking place on the Cotter property in the Boston Creek district, where a vein some three feet in width and carrying tellurides has been opened up on the surface at a point near the southern boundary of the property. The vein runs about east and west and has a dip of about 40 degrees to the north. Meantime a diamond drilling campaign is being carried out some distance to the north, where the eastward continuation of the Miller-Independence vein is being explored. The drill is understood to have cut the vein at depth where about six feet in width of ore has been indicated. Some of the vein matter contained visible gold. With the big vein of the Miller-Independence dipping about 65 degrees to the south and the new vein found on the southern part of the Cotter dipping to the north, it would appear probable that the two orebodies would merge at depth. Everything considered, the extremely unfavorable weather and accompanying difficulty in transporting machinery and supplies to the property, as well as inability to obtain fuel, the results achieved at the Miller-Independence, the Cotter, the Cullen-Renaud and other nearby properties, the camp is gradually working into a very important place, and outside interest is steadily increasing.

Dome Mines.

The resumption of milling operations at the Dome Mines early in the new year is now considered a possibility in well-informed circles. The underground workings of the mine have been placed in a satisfactory condition to best meet the demands of the 1,300-ton mill. Not only is this the case, but it is also learned that so favorable have been the developments at depth, that besides adding greatly to the ore reserves of the mine, the average grade of ore to be treated will be higher. With ample cash available and a large tonnage of good grade ore available for treatment in the mill at once, some 400,000 tons of \$5.10 ore being already mined in a shrinkage stope at the property, it is believed but a short time will elapse before the mine is placed on a footing quite as profitable as pre-war days.

Imperial.

It is reported that the Imperial Mine is being dewatered, preparatory to a thorough examination by the McIntyre-Porcupine. During the early days of the camp the Imperial attracted a good deal of attention. Surface indications were promising, a number of quartz stringers in a large dike containing visible gold.

Chromite in Reaume Township.

An encouraging deposit of chrome has been opened up on a group of claims in the Township of Reaume, some six or eight miles southwest from Cochrane. The result of work carried on during the past summer is said to have opened up fair possibilities. The district is easily accessible by water route from the Transcontinental, being situated immediately west of the Frederickhouse River.

Gold Lake Company.

The Gold Lake Mining Company, with its head office in Toronto, has been formed for the purpose of operating a property in the southern part of the Township of Deloro, in the Porcupine district. The company own nine claims situated near Gold Lake. A number of men are now engaged in road work, and camp buildings are being erected.

Prospecting in Langmuir Township.

Excellent results are said to have attended exploration work on a group of fourteen claims situated in the Township of Langmuir. It is stated that a wide vein has been opened up for a distance of about 200 feet, in which pyrrhotite and chalcopyrite is present in what is believed to be commercial quantities.

Bonsall Property, Gowganda.

According to word from Gowganda, work has been suspended on the Bonsall property, which is controlled by M. J. O'Brien and Sir Clifford Sifton. Results are said to have been reasonably satisfactory.

BRITISH COLUMBIA

Queen-Kootenay Belle Consolidation.

The Queen, Vancouver, Kootenay Belle and Alexandra Mining Groups, situated on Sheep Creek, Nelson (B.C.) Mining Division, have been consolidated under

control of Mr. A. W. McCune, of New York. For some time it has been the opinion of mining engineers that these properties to be successfully operated would have to be placed under one management. This having been accomplished, it is believed that their joint output should be very materially increased. Sheep Creek has been a producer of gold since 1900. The Queen Mine was a producer from 1900 up to two years ago, when, as a direct result of labor difficulties, operations were suspended. In that time the camp produced gold to the amount of about \$2,500,000, of which the Queen was responsible for \$1,312,654 and the Kootenay Belle, \$104,972. Work has been commenced upon the portal of a 3,000-ft. crosscut commencing at the Malwaaz (one of the claims) and running southeast across the several properties to the Alexandra, which will cut several parallel veins. The new pipe line from the compressor to the new portal is also under way. About 25 men are being employed and this number will be increased to 200. New development will entail an expenditure of over \$200,000. The erection of a 200-ton mill, replacing the old Queen mill, is contemplated and buildings are being remodeled and renovated. A power line and telephone service with the City of Nelson are being arranged for. The manager in charge is Mr. Marcus M. McCune.

Mr. John Hopp, the operator of the largest placer ground areas of the Cariboo District, British Columbia, has come to the Coast from the interior and states that, because of the late spring and early summer of 1918, the gold production of that camp will be considerably reduced in comparison with that of 1917. Mr. Hopp asserts that it has not been possible to carry on new development to the extent necessary because of lack of labor and of capital. The difficulty in securing men, together with the general high costs and the fixed value of gold, has held the operators back seriously. Investors, Mr. Hopp explains, have shown little interest in such propositions as that offered by the placer gold fields of the Cariboo. He is looking forward, however, to better times with the coming of peace.

B.C. Mines Department Lets Contract for Diamond Drilling.

The International Diamond Drill Contracting Company, of Spokane, Wash., has been awarded a contract by the Minister of Mines of British Columbia for 10,000 lineal feet, more or less, of drilling on the Snowstorm Group of Copper-Silver-Gold Claims, situated in Highland Valley, Yale District. This is the same company that has been engaged in the development of the deposits of Copper Mountain for the B.C. Copper Company and the Canada Copper Co., for which concern it drilled a total of 100,000 feet. The Government work will start without loss of time.

STANDARD SILVER-LEAD.

The Standard Silver-Lead Mining Co. during the month of June last netted \$16,137 in profits. At the close of that month the company's surplus was increased to \$203,112. These figures offset the report for the month of May, when there was a loss of \$6,272. The change from loss to profit is explained by the receipt of \$41,917 on operating account in June, as compared to \$21,720 in the previous month, the items of June including \$35,809 from zinc sales and \$3,059 in final settlement of sales for April.

MARKETS

TORONTO MARKETS.

Cobalt oxide, black, \$1.50 per lb.

Cobalt oxide, grey, \$1.65 per lb.

Cobalt metal, \$2.50 per lb.

Nickel metal, 45 to 50 cents per lb.

White arsenic, 12 cents per lb.

Nov. 26, 1918—(Quotations from Canada Metal Co., Toronto).

Spelter, 10½ cents per lb.

Lead, 10¼ cents to 10½ cents per lb.

Antimony, 14 cents per lb.

Copper, casting, 28 cents per lb.

Electrolytic, 29½ cents per lb.

Ingot brass, yellow, 21 cents; red, 26 cents per lb.

Nov. 26, 1918—(Quotations from Elias Rogers Co., Toronto).

Coal, anthracite, \$12.00 per ton.

Coal, bituminous, nominal, \$9.50 per ton.

NEW YORK MARKETS.

Copper—Fixed for the period August 7, 1918, to January 1, 1919, at 26 cents per lb.

Tin—Prices are nominal. Supply is controlled by the American Iron and Steel Institute.

Silver—The U.S. Treasury announced on Aug. 15 that the maximum price was fixed at \$1.01½ per ounce.

Lead—The producers' price is 8.05 cents per lb.

Zinc—Market dull, 8 to 8½ cents per lb.

Aluminum—Fixed at 33 cents per lb.

Silver—101½ cents per ounce.

Molybdenite—\$1.00 to \$1.10 per lb.

Pyrites—30 to 40 cents per unit.

The Rossland Mining Camp of British Columbia has been severely hit by the Spanish influenza epidemic. The mines have closed down and even the daily newspaper of the town has ceased publication.

MINE CARS

We manufacture an exceedingly large range of styles and sizes of Mine Cars: Rotary, Side Dump, End Dump, Tipple Cars, Skip Cars, etc.

We build any type of steel body car that you may desire. If our large catalogue does not contain the car you want, let us give you a price on your car, built to your liking, from your own specifications.

MINE HOISTS

We show herewith one standard type of our small Mine Hoists for use in the smaller mines, or for prospecting or development work.

We make many other designs, besides the one illustrated, one of which is probably just the Hoist you are looking for.

We also design special Hoists to meet the exact needs of the user. We build them to your order, just the way you want them built.

Made in 7 sizes, from 10 Horse Power to 50 Horse Power, and with any Diameter Drum up to 48 inches.

1846

MR. JUSTICE MURPHY'S DECISION IN RELIEF ACT CASE.

Does the Relief Act covering licenses on coal and petroleum lands, passed by the Legislature of British Columbia in 1915, automatically protect from relocation, coal and petroleum lands upon which license fees have become due, but have not been paid, subsequent to August 1st, 1914? This in effect is the pleading of the Minister of Lands in the action brought against the Minister by Messrs. Harding, Johnston and Gillespie. Mr. Justice Murphy, of the Supreme Court of British Columbia, has decided against the Minister, but it is understood that the case will be appealed.

Some years ago, coal prospecting licenses numbered 9852-3-4 were applied for and secured. The claims are on the North Thompson River, in the vicinity of Kamloops. On the 17th day of May, 1914, the annual fees were paid, keeping the title in good shape until May, 1915. Under the Relief Act mentioned above, application was made in July, 1915, for relief against forfeiture as the current year's fees had not been paid. At the time, no relief was granted, but a suggestion came from the Minister of Lands to the effect that a proportionate amount of the fees would be accepted. This suggestion was not acted upon. On the 18th day of February the lands were located by Freeman Harding, James Garfield Gillespie and William Henry Johnston, who subsequently gave the requisite 60 days' notice of intention to apply for licenses, duly published the notice in the Gazette and a Kamloop's newspaper, and applied to the Minister of Lands for their licenses, which application was refused.

A protest was entered, and on the 9th day of May the Minister of Lands referred the matter to the Cabinet Council, who sustained his decision, and on the 23rd day of May the new applicants for licenses gave notice of appeal to the Supreme Court.

Meanwhile, that is to say, on March 21st, the original license holders paid to the Department one year's fees, namely, \$300.00, and an Order-in-Council was passed on the 31st day of May, extending relief to the original holders for the balance of the fees. In the action against the Minister of Lands, the old licensees were not made parties to the trial, although the judge said they should be given an opportunity of hearing. Mr. A. M. Whiteside, of Vancouver, was present, representing the assignee of a portion of the claims, but as he had not received instructions for all the old license holders, Sir Charles Tupper, for the plaintiffs, successfully prevented his argument being heard.

A conference of miners of District 18, which includes the eastern section of British Columbia and the Province of Alberta, will be held on January 6th to discuss problems relative to coal mining operations within the limits of that section and the men's attitude toward the same.

There is some doubt as to what the Munition Resources Commission of the Dominion of Canada proposes to do in regard to the continuance or the discontinuance of the work of prospecting for platinum now in progress on the Tulameen River, British Columbia. At the time of writing, this activity continues. A No. 3 traction Keystone drill, complete with tools and accessories, is in operation. Whether it will be maintained throughout the winter, now that the pressing war need for this metal has passed, is a question being asked by those interested.

Oxy-Acetylene Welding and Cutting

3½ Ton Press Frame Repaired by Welding

In an accident this big power press frame, weighing 3½ tons, was broken in two pieces—the breaks occurring just below the bearing. By the Prest-O-Lite Welding Process the broken frame was repaired and ready for service in 40 hours.

Two welds, 11 inches wide and 9 inches deep, were necessary. The actual welding time was 7 hours and 40 minutes.

For repair work, as well as for manufacturing, the Prest-O-Lite Process is invaluable.

Prest-O-Lite PROCESS

employs both gases (acetylene and oxygen) in portable cylinders. Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send a literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

PROVINCE OF ONTARIO

Ontario's Mining Lands

Ontario, with its 407,262 square miles of area contains many millions of acres in which the geological formations are favorable for the occurrence of minerals, 70 per cent. of the rocks being of pre-Cambrian age. The phenomenally rich silver mines of Cobalt occur in these rocks; so also do the far-famed nickel-copper deposits of Sudbury, the gold of Porcupine and Kirkland Lake, and the iron ore of Helen, Magpie and Moose Mountain mines.

Many other useful minerals, both metallic and non-metallic, are found in Ontario:—actinolite, apatite, arsenic, asbestos, cobalt, corundum, feldspar, fluorspar, graphite, gypsum, iron pyrites, mica, molybdenite, natural gas, palladium, petroleum, platinum, quartz, salt and talc.

Building materials, such as marble, limestone, sandstone, granite, trap, sand and gravel, meet every demand. Lime, Portland cement, brick and tile are manufactured in quantity within the Province.

Ontario in 1917 produced 46 per cent. of the total mineral output of Canada. Returns made to the Ontario Bureau of Mines show the output of the mines and metallurgical works of the Province for the year 1917 to be worth \$72,093,832, of which the metallic production was \$56,831,857.

Dividends and bonuses paid to the end of 1917 amounted to \$11,486,167.45 for gold mining companies, and \$70,821,829.34 for silver mining companies, or a total of \$82,307,996.79.

The prospector can go almost anywhere in the mineral regions in his canoe; the climate is invigorating and healthy, and there is plenty of wood and good water. A miner's license costs \$5.00 per annum, and entitles the holder to stake out in any or every mining division three claims of 40 acres each. After performing 240 days' assessment work on a claim, patent may be obtained from the Crown on payment of \$2.50 or \$3.00 per acre, depending on location in surveyed or unsurveyed territory.

For list of publications, illustrated reports, geological maps and mining laws, apply to

G. H. FERGUSON,

MINISTER OF LANDS, FORESTS AND MINES,
Toronto, Canada

Do You Also Look Inside ?

THE use of Camouflage is not confined solely to the War Zone and the trenches--other things look what they're not--electrical goods frequently--Motors often. Better be safe than sorry by buying Wagner Motors--dependable like all goods sold by us.

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

SALISBURY ELECTRIC COMPANY, LIMITED

615 Yonge Street, Toronto

These refining grinders reduce ordinary ground pulp to an even finer texture for the better grades of wood pulp paper.

Making One Belt Do the Work of Three

IN a big Ontario paper mill this refining grinder drive had been a glutton for belts.

Ten months from 8-ply belts was considered exceptional service.

The superintendent was finally induced to try Goodyear "Extra Power." We prescribed 7-ply to replace the former 8-ply belt, giving a lower initial cost.

Now, after two and a half years, the superintendent writes of continuous twenty-four hour a day service for all that time.

Just three times the service previously known. Less than one-third the cost.

Further saving—"Extra Power" gave continuous service. Only one stop to apply one belt in two and a half years.

This problem of belting costs is too vital to be decided off-hand. Belt life and belt performance must be balanced against belt price.

Thousands of executives who buy belts on facts, who keep belt costs, are turning to "Extra Power." It is the dominant factor in the belt field to-day.

It will be worth **your** while to talk with a man trained in belt problems by Goodyear. It places you under no obligation. Just 'phone, wire, or write any branch.

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,

Per C. F. BUSS, Superintendent.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY,
GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping. Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

CANADIAN MINING JOURNAL

VOL. XXXIX

TORONTO

No. 24

The "Square Deal"—promote it in these days of restless labor by an International Time Recorder.

Prosperity!

Its here and its going to stay! We know that by the big, steady stream of orders that is coming in to us for International Time Recording Systems. And we know—and you know—that Time Recorders are not bought for idle mills and factories.

The way to deserve Prosperity is to be ready for it: Face 1919 with a proper Time Recording System.

International Time Recorders

Get all the working time you pay for—with absolute satisfaction to the employee. How? Simple! Let every man be his own time keeper—he's bound to be satisfied with his time record when he made it himself. Put in cold blooded, accurate, unprejudiced, unchangeable International Time Recorders. They ensure satisfaction and a square deal to all.

Let us send you our latest folders

Vice-President and General Manager

The International Time Recorders print the late arrivals and early leavers' time in RED. All other printings mean regular time. A godsend to an over worked cashier when making up pay sheets.

Variable Air Power Demand

For air power service in which the demand varies within wide limits, highest efficiency is secured by installing one or more

Sullivan "WN-4" Twin Angle Compound Compressors

Each half of a "WN-4" Compressor is a complete, two-stage machine, with independent air inlet and unloader.

At partial loads the H.P. input per 100 cu. ft. of air remains constant, instead of running up, as with a single large unit.

If you are buying power on a "peak-load" contract, "WN-4" Compressors

will cut down your bills for current.

Accurate balance of reciprocating members, End-rolling Finger Valves and Three-Pass Counter Current inter-coolers are other factors which render "WN-4" Compressors so desirable for mining air-power service.

Capacities, 900 to 2600 cu. ft.

THE CIRCO PAGE

Illustrating Compressed Air Machinery, Tools, and Appliances

The Jackhamer Hard at Work

For down-hole drilling, flat-hole work as shown in the illustration or in the special mounting, the Jackhamer is the drill you need. There is no handier one-man drill, and the miner finds it easy to run.

The Jackhamer is made in Canada for Canadian conditions. It is not an experiment, but has been proved by years of service. The materials are first class, manufacture is extremely careful, and the Jackhamer is absolutely dependable.

The Jackhamer will stay hard at work.

"TESTED"

The Last Word in Rock Drills

TESTED—the clinching quality or proven durability—means much to rock drill users. It means sure service—a long life for the Drill—and durability wherever used, with no long stops for repairs, because it is proven service.

Hundreds of Cleveland users after a long service of constant use against all conditions have sent back the verdict that for durability, labor and time saving "Cleveland" excels all.

We can prove these facts by use if you will only write for our Bulletin No. 35A.

OPPORTUNITIES

--for--

Prospectors and Mining Companies

The mineral wealth of Northern Ontario is enormous. From a few developed areas a very large output of nickel, copper, silver and gold is being made. Many promising areas are awaiting the prospector and miner.

Recently Northern Manitoba has become an important producer of copper ore, and many promising gold deposits have been located. This is an excellent field for the prospector.

One of the greatest factors in development of mineral areas is the provision of transportation facilities. Railways and the mining industry have together played a very important part in the development of several parts of Canada.

The Canadian Northern Railway, recently constructed across Northern and Western Ontario, has opened up for prospecting a large territory. Easy access to many promising areas is now available. Geological maps of some of these areas can be obtained from the Geological Survey, Ottawa.

The Canadian Northern Railway in Manitoba gives access to the Pas Mineral Area. In Alberta the Canadian Northern is serving important coal fields.

THE DEPARTMENT OF RESOURCES CANADIAN NORTHERN RAILWAY

The Department of Resources, Canadian Northern Railway Building,
Toronto, will be pleased to furnish information about
the districts served.

NICKEL

Shot—High and Low carbon.

Ingots—Two sizes, 25 lbs., 50 lbs.

ELECTROLYTIC NICKEL—99.80%

Prime Metals for the Manufacture of Nickel Steel, German Silver, Anodes and all remelting purposes. Our Nickel is produced as Rods, Sheets, Strip Stock, Wire and Tubes.

PRINTING AND PUBLISHING

We wish to draw the attention of mining, metallurgical, and development corporations to our excellent facilities for compiling, arranging, illustrating, printing and distributing Annual Statements, Special Reports, Descriptive Pamphlets, etc.

We guarantee our work in all respects. In letter-press, half-tone engravings and reproductions in color, we are prepared to give entire satisfaction.

We shall be glad to furnish estimates to enquirers.

THE FLOTATION PROCESS

MINERALS SEPARATION NORTH AMERICAN CORPORATION

Is the registered owner of the following Canadian patents: Nos. 76,621; 87,700; 94,332; 129,819; 94,516; 96,182; 96,183; 99,743; 127,397; 129,820; 134,271; 135,089; 137,404; 142,607; 147,431; 147,432; 148,275; 151,479; 151,480; 151,619; 151,810; 157,488; 157,603; 157,604; 160,692; 160,693; 160,694; 160,846; 160,847; 160,848; 160,849; 160,850; 160,937; 163,608; 163,707; 163,926; 164,587; 165,390; 166,415; 167,474; 167,475; 167,476; 167,603; 187,263.

On December 11, 1916, the SUPREME COURT OF THE UNITED STATES unanimously adjudged our basic patent for air-froth-flotation to be valid, holding that this patent covers any process of froth flotation wherein the results obtained are such results as are secured by the use of a fraction of one per cent., on the ore, of an oily frothing agent in an ore-pulp, with agitation. Three of the thirteen claims which specified the use of "a small quantity of oil" and which the Court held to be invalid have since, by proper disclaimer, been brought within the scope of the Supreme Court's decision.

On May 4, 1917, in the UNITED STATES DISTRICT COURT OF MONTANA, the opinion of Judge Bourquin was filed in the case of Minerals Separation Ltd., and others against Butte & Superior Mining Company, and was followed by a decree on September 17, 1917, wherein it was adjudicated that the three claims which had been limited by disclaimer were valid and infringed, and that the seven claims adjudged to be valid by the Supreme Court of the United States were infringed. The acts thereby adjudged to be infringement included the use of mixtures of petroleum oils and mineral-froth-forming oils in a total amount exceeding one per cent. on the ore, and also the use of Callow pneumatic cells.

On May 24, 1917, the UNITED STATES CIRCUIT COURT OF APPEALS at Philadelphia, in the case of Minerals Separation, Ltd., against Miami Copper Company, unanimously sustained the validity and broadly construed a second basic patent, owned by us, for the use of all "Soluble Frothing Agents." In the same opinion, the Court also validated a third patent for the use of cresols and phenols in the cold and without acid. The defendants, Miami Copper Company, endeavored to avoid infringement of these patents by using Callow pneumatic cells, but the Court held that the operations of the defendant company infringed all three patents.

On November 11, 1918, the SUPREME COURT OF THE UNITED STATES granted the petition of Minerals Separation, Ltd., and others for a Writ of Certiorari to review the decree of the United States Circuit Court of Appeals at San Francisco which had reversed so much of the decree of Judge Bourquin in the suit against Butte & Superior Mining Company as adjudged to be infringements those acts which employed oil of any kind or character used in excess of one-half of one per cent. on the ore.

Prospective users of our flotation processes are earnestly requested not to be influenced by the views disseminated by interested parties that any of these BASIC PROCESS PATENTS can be evaded by a mere variation of apparatus for agitating and aerating the pulp, or by the simple addition of oils or other materials in excess of a fraction of one per cent. on the weight of the ore treated.

BRITISH COLUMBIA

The Mineral Province of Western Canada

Has produced Minerals valued as follows: Placer Gold, \$75,116,103; Lode Gold, \$93,717,974; Silver, \$43,623,761; Lead, \$39,366,144; Copper, \$130,597,620; Other Metals (Zinc, Iron, etc.), \$10,933,466; Coal and Coke, \$174,313,658; Building Stone, Brick, Cement, etc., \$27,902,381; making its Mineral Production to the end of 1917 show an

Aggregate Value of \$595,571,107

The substantial progress of the Mining Industry of this Province is strikingly exhibited in the following figures, which show the value of production for successive five-year periods: For all years to 1895, inclusive, \$94,547,241; for five years, 1896-1900, \$57,605,967; for five years, 1901-1905, \$96,509,968; for five years, 1906-1910, \$125,534,474; for five years, 1911-1915, \$142,072,603; for the year 1916, \$42,290,462; for the year 1917, \$37,010,392.

Production During last ten years, \$296,044,925

Lode-mining has only been in progress for about twenty years, and not 20 per cent. of the Province has been even prospected; 300,000 square miles of unexplored mineral bearing land are open for prospecting.

The Mining Laws of this Province are more liberal and the fees lower than those of any other Province in the Dominion, or any Colony in the British Empire.

Mineral locations are granted to discoverers for nominal fees.

Absolute Titles are obtained by developing such properties, the security of which is guaranteed by Crown Grants.

VICTORIA, British Columbia

For prospectors and small tonnages

10-TON CONCENTRATING MILL

There is no reason why prospectors and operators of small mines cannot get the same percentage of efficiency as the huge plants milling thousands of tons. We offer a ball-mill costing only as much as the bare foundations for stamps of equal capacity and designed like the large MARCY mills.

Number Thirty-Two **MARCY MILL** CRUSHING "ONE EASY STEP"

This mill is suitable for plants of from 10 to 15 tons capacity and can be operated by gas-engine, water-wheel, or electricity, requiring only about 4 H.P. It is self-contained and portable; is fitted with the patented Marcy open-end discharge grate of welded chrome-steel; will grind for amalgamation or concentration, taking crusher feed. Low first cost, low maintenance, high efficiency, *lowest cost per ton output*. Follow the experience of the large mill user on a small scale.

Write to-day for Bulletin No. 42.

KLIM

Easy to get Milk into Camp

Freshly pasteurized, separated milk is reduced 90 per cent. in weight and 90 per cent. in bulk when, by removing that percentage of water, it becomes KLIM—the dry powder.

This means that the most nutritious of all foods can be brought to your camp at less cost than any other food.

Klim has the natural flavor of separated milk unchanged and is good to drink, to use in tea and coffee and for cooking and baking.

Order in 10-lb. tins.

The Federal Trade Commission, United States, has issued formal complaint against Minerals Separation, Ltd., Minerals Separation American Syndicate, Ltd., Minerals Separation American (1913), Ltd., all of London; Beer, Sondheimer & Co., Frankfort-on-Main, Germany; Beer, Sondheimer & Co., Inc., and Minerals Separation North American Corporation, New York City; and Benno Elkan, Otto Frohnknecht and Harry Falek, of New York City. These concerns and individuals are cited to appear before the Commission on December 30th, 1918. They are charged with enforcing agreements "with the intent, purpose and effect of stifling and suppressing competition."

If the Federal Trade Commission will push this investigation until the whole situation is clarified, they will deserve the thanks of the mining and metallurgical industry of not only the United States but also of Canada and, in fact, of all mining countries.

THE CANADIAN MINING INSTITUTE

Should the character of the Canadian Mining Institute be changed? Some of the members seem to be of the opinion that it should be merely an engineering or scientific society rather than an Institute which will continue to draw members from all who are prominently interested in the direction of mining and metallurgical enterprises in Canada. We believe that the Institute can be of most service to the industry as at present constituted.

Some time ago numerous false statements concerning the character of the Canadian Mining Institute were given wide circulation by a poorly informed committee of another society. Some gentlemen having misinformed them, the executive of that society published a very misleading report and asked the members to give the matter as much publicity as possible through the newspapers. In this way the statement was spread abroad that the Canadian Mining Institute was merely a "trade organization" and that the number of scientifically trained men among its members was only about 20 per cent.

To these false statements the Canadian Mining Journal took exception and called attention to them editorially. The Council of the Canadian Mining Institute also took up the matter and demanded a retraction. After many months a half-hearted retraction was made.

Since then, a strange phenomenon has occurred. It having been proven that the Canadian Mining Institute is largely made up of scientifically trained men, some of the members seem to have concluded that the Institute would therefore be of greater usefulness if it excluded all mining men of other classes. This absurd deduction has led to some expressions that imply that the only people of importance in the mining industry of this country are the scientifically trained men. The falsity of this idea scarcely needs mention. Scientifically trained men should be the first to recognize that it takes a variety of men to carry on an industry and that the welfare of that industry cannot be properly assigned to any one class. It is complimentary to the scientifically trained men that they make up four-fifths of the membership of the Canadian Mining Institute. That fact shows that they are taking the lion's share of the work which the founders of the Institute initiated. But it should be recognized that scientists have only the right to demand recognition in proportion to the service which they give. They alone do not develop our mineral resources. It is pleasing to record that they are taking a very large part.

PROGRESS IN MINING IN CANADA IN 1918.

This number, the last of the Canadian Mining Journal for the year 1918, is devoted to a review of progress in the mining districts of the Dominion. In this number will be found special articles on mining in Nova Scotia, Quebec, Ontario, Manitoba, Alberta and British Columbia.

Of unusual interest is the recent progress in Manitoba, a province which has only recently become an important producer of metalliferous ores. There can be little doubt that exploration and development of Northern Manitoba's mineral resources will result in material additions to the wealth of the country.

In Nova Scotia, scarcity of miners has resulted in decreased output of coal. In Alberta, a larger market has resulted in great increase in output, so that, for the first time, Alberta produced more coal than Nova Scotia.

The Quebec asbestos industry is flourishing, while the mining of copper-bearing pyrites for their copper and sulphur contents continues actively.

The Ontario nickel, copper, gold and silver production was very large during the year in spite of many adverse circumstances. The record of the gold mines is a remarkable one and may be taken as an indication of the great future of this industry.

British Columbia made a large output of metals and coal. The search for minerals for war purposes drew attention to the resources of this great province and the activity in 1918 will doubtless have permanently good results.

CORRESPONDENCE

THE MINING ACT.

To the Editor of the Canadian Mining Journal:

Sir,—In your issue for November 15th I note the proposed amendments to the Mining Act, as well as a letter from the secretary of Port Arthur Board of Trade.

Probably you, Mr. Editor, or some of the readers of your journal, can inform me of what use any additions or changes to the Mining Act are, so long as sections 85 and 86 remain in force.

Laws of all kinds may be good or bad; but whether they are good or bad is immaterial so long as power is given to one or two officials to say whether the laws are to be complied with or not.

Mr. T. E. Godson claims that, in his opinion, the Ontario Mining Act is the best in the Dominion, is more elastic than those of other provinces.

As for being elastic, that is the root of the evil, for a prospector never knows whether he is in secure possession of his claims or not. Some sharp mining broker may get wise to the fact that some fool of a prospector has made an important discovery and staked and recorded a claim, covering ground that in the dim, forgotten past was owned by himself. Forthwith a lawyer is engaged and a relief against forfeiture applied for, resulting eventually in the lawyer pocketing

a nice fee, the broker feeling elated over his new mining property, and the commissioner feeling satisfied with a day's work well done. But what is the feeling of the prospector? Sad to relate, he feels that legally or illegally he has received a dirty deal. He wonders why the records did not show that the ground was not open for staking, and why the recorder accepted his application for a record, and why, if it was open, he was not allowed to remain in possession. He goes back into the bush to keep company with the wild animals, knowing that the biggest and most vicious brute may be his fellow man; that under the guise of law someone has robbed him of his well-earned reward for honest labor. Of course, he knows that he could appeal, but he has not the money required to do so.

Were anything pertaining to extensions or relief required to be granted and on the records before the expiration of the life of the claim, very little harm might be done. But to allow a claim to become open for staking, and, being staked, to take it from the lawful holder and give it to one who lost it because he did not comply with the law, is, even if lawful, nothing short of robbery.

This ability to get a relief against forfeiture has developed a practice of which I will give a rough outline. Mr. A, who, by the way, is not in the habit of doing work in the bush, approaches Mr. B and offers him a stated sum (away below the amount he knows it would cost) to get the work required to be done during the year by law, stating that he does not care how it is done so long as it is on record. B takes the money and may or may not do any of the work, but files a report of work.

D comes along and finds no evidence of any work having been done. He stakes the claim and files a dispute which in due course comes up before the commissioner. The burden of proof rests on D. Suppose he is able to prove that no work was done. A pleads that he paid B for doing the work and that B is the only and original rascal, and he asks for time in which to do his work. This is usually granted, and he retains possession of the claim.

What does D get? He has to pay his own costs and about the only thing he is likely to receive is a lecture delivered with the purpose of discouraging claim jumping. Any evidence that B might give would never be considered. Accordingly, A, the instigator of the crime, goes clear. In fact, it is usually made to appear that he is a very much abused man. Consequently, no one cares to dispute a report of work filed, even knowing that the work was never done.

Subsection 3, section 85, was first passed as an Order-in-Council and seems to have been created with a view to providing work for the commissioner and the inevitable lawyers. I have no quarrel with the principle of this sub-section, but it lacks in completeness. It does not require, for instance, that the enlisted man report to the recorder of the district in which his claims are located. As a result, the recorder will accept applications for claims that are owned by soldiers and when these soldiers come back the trouble begins. It is, therefore, easily seen that the lack of attention to detail has beclouded the title to all mining locations made since the 4th day of August, 1914.

This, Mr. Editor, is one of the results of the "elastic" nature of the Mining Act.

Yours, etc.,

L. HEDLUND.

Gowganda, Dec. 2nd, 1918.

Mining in the Province of Quebec in 1918.

By Theo. C. Denis.

As regards mining, the Province of Quebec is rather different from the other provinces, inasmuch that, unlike Ontario and British Columbia, its production in metalliferous ores is small and it differs from Nova Scotia and Alberta in possessing no coal mines. The backbone of Quebec mineral production are non-metallic substances—asbestos, mica, magnesite, pyrites for sulphuric acid, and a very varied assortment of structural materials. The prominent part which the latter plays in the mineral production of the province is indicated by the fact that in pre-war times (in 1913) in a total value of a little over \$13,000,000 the building materials accounted for 62 per cent., the metallic substance for 3½ per cent., only, the balance (34½ per cent.) being made up of non-metallic minerals, such as asbestos, mica, graphite, magnesite. The effect of the war on our mining industry has been most marked, for in 1917 and 1918 the above proportions were greatly altered, and they now stand about as follows: Building materials, 33 per cent.; metallic ores, 12 per cent.; non-metallic minerals, 55 per cent.; the total production of all of which amounted to \$16,266,000 in 1917.

Figures for 1918 are not yet available, but it is likely that the total value will exceed 17 million dollars.

Asbestos Industry is Flourishing.

The asbestor industry has been very active during the year, the demand having exceeded the production. At present there are practically no stocks of asbestos on hand. The production has been strongly stimulated by the war needs, and fortunately the cessation of hostilities is not likely to have any marked effect on the industry, as the ship construction programmes of various countries call for a large consumption of asbestos for a long time to come.

Demand for Chromite Falls Off.

The same cannot be said of chrome mining, which for three years past has enjoyed an unprecedented activity in the Coleraine district, and also at St. Cyr, near Danville. Since the signing of the armistice, the demand for chromite has noticeably fallen off. However, several producers have contracts to fill for some time to come at satisfactory prices, and the decrease in activity will be gradual. It is even possible that the more favorably situated deposits may continue to produce, and compete, on the American market, with New Caledonia, Rhodesian and Cuban ores. The figures of production for 1918 will probably fall below the previous year's, and 1917 will remain a banner year in the Canadian chrome industry for some years.

Magnesite Industry Permanently Established.

Magnesite mining has been very active. Two of the companies are now producing a dead-burned magnesite which finds a very ready market. Cement kilns, burning powdered coal, are used for the purpose and the results are very satisfactory. There is little doubt that this industry is permanently established.

Shortage of Labor Keeps Down Production of Pyrite and Copper.

The pyrite and copper ore production has been greatly handicapped by the shortage of miners. Labor, and especially efficient labor, has been very scarce throughout the year. On this account, and also owing to difficulties in getting railroad cars, the tonnage will probably show a decrease as compared with 1917.

A Successful Year for Quyon Molybdenite Industry.

Throughout the whole of 1917, the price of molybdenite was set by the Government at \$1.09 a pound, and exports to countries other than England were prohibited on account of the war needs of Great Britain. The price in the United States increased up to \$2.50. In January, 1918, the restrictions on the export of molybdenite were removed and for some time the producers enjoyed the wider market at better prices. The supply, however, seems to have more than met the demand, for during the latter part of the year the price in the United States fell to \$1.00 a pound. The Quyon mine had a very successful year and the method of concentration adopted is giving very good results. It is claimed that extraction is about 90 per cent., in concentrates containing 80 to 90 per cent. molybdenite.

Steady Production of Zinc by Zinc Co., Ltd.

Zinc and lead ore mining progressed during 1918. The mines of "Zinc Company, Limited," in Portneuf country, produced all year without interruption, and active development was carried on by the "Federal Zinc and Lead Company, Limited," on their properties at the head-waters of Cascapedia River in Gaspé. These deposits appear to be very promising. At present, they are handicapped by the lack of means of transportation.

Labor Situation Improving.

Since the middle of November the labor situation has been eased off considerably. There is no longer the great dearth of men which prevailed throughout the first ten months of the year. The mine operators have not reduced wages, but they can now to some extent choose the men and dispense with the incompetent, which they could not afford to do before. The labor employed is now much more efficient and willing than a month ago.

Production of Building Materials Should Be Large in 1919.

The cessation of war material manufacture will be felt on next year's production, when a decrease is to be expected. But, on the other hand, the decrease of activity in mining of war minerals will to some extent be compensated by a resumption of production of building materials, which industry has laid comparatively dormant for the last four years.

DOMELAKE.

Mr. Charles A. Randall has been appointed manager of the Dome Lake mine to succeed Mr. A. H. Brown who has resigned. A full force of men has been engaged at the property and a comprehensive plan of development has been mapped out. A winze is being sunk from the 500-foot level to a depth of 600-feet. Three shifts are working.

NEW MANAGER FOR DOMINION REDUCTION.

Mr. S. W. Cohen has been appointed general manager of the Dominion Reduction company at Cobalt, to succeed Mr. E. M. Steindler who died in New York recently. Mr. Cohen visited the property in Cobalt early in the month, accompanied by Mr. D. M. Steindler, president of the Dominion Reduction. Mr. Cohen was at one time general manager of the Crown Reserve and Porcupine Crown Mines, and is well known in Northern Ontario.

Northern Ontario Gold Mines in 1918 Produced about \$9,168,000, Despite Handicaps.

By J. A. McRae.

Despite the great economic strain caused by the world war, the gold mines of Northern Ontario during 1918 have been able to increase their output over that of 1917. While it is yet too early to know what the exact amount will be, it is nevertheless certain that a production of at least \$9,168,000 will be recorded. This compares with a total of \$8,698,831 during the year 1917, an increase of more than half a million dollars. Such an achievement, with over half the gold mines closed down, is considered extremely important, so much so, that interest in gold properties, both prospective and proven, has been recently growing rapidly.

Hollinger Increases Output.

The progress being made, and the results recorded at the Hollinger Consolidated has exceeded the best expectations of the most sanguine, and by producing approximately \$520,000 monthly, or something like \$6,250,000 during the current year, has eclipsed all its former records. Since 1911, this great gold mine has repeatedly been the cause of startling achievements. However, an increase of over \$2,000,000 in output during 1918 over that of 1917, or more than \$1,000,000 above the previous best year in the company's history, was more than the most optimistic had dared to hope. Since beginning production in 1911 the property of the Hollinger has yielded a total of close to \$26,000,000, out of which \$9,178,000 has been returned to shareholders in the form of dividends, and, in addition to which the greatest mill for the treatment of gold ore on the continent has been erected. Also, a large cash surplus has been accumulated, upwards of \$2,000,000 being invested in Dominion Government bonds. At the beginning of 1918 the official estimate of ore reserves showed a little over \$40,000,000. The following is a summary of the output from the Hollinger, beginning in 1911:

Year	Values Recovered.	Dividends Paid.
1911	\$ 46,082.52
1912	933,682.00	\$ 270,000.00
1913	2,488,022.58	1,170,000.00
1914	2,719,354.47	1,170,000.00
1915	4,205,901.69	1,720,000.00
1916	5,073,401.05	3,126,000.00
1917	4,261,938.72	738,000.00
1918	6,250,000.00	984,000.00
Totals	\$25,978,383.03	\$9,178,000.00

It could perhaps be pointed out that the estimate of output for 1918 is based upon official figures which show a production of upwards of \$520,000 monthly during the first nine months of the current year. The \$984,000 in dividends paid during 1918 does not represent one-half of the net earnings, in that at the beginning of this year the net surplus was less than one-quarter of a million, whereas it is now apparently upwards of two million dollars.

McIntyre-Porcupine.

The McIntyre-Porcupine also continues to develop in a big way. The main works are now being carried to a depth of 1,375 feet, the deepest workings in the camp.

Production at the McIntyre is being maintained at about \$140,000 per month. With additional labor this output could be materially increased. The ore in reserve at the McIntyre ranges between \$4,000,000 and \$5,000,000.

Milling Facilities and Present Production.

Perhaps the clearest and most concise description of the present position of the various gold mines could be given as follows, showing the mining facilities at each mine and showing whether or not the mills are in operation, and at what capacity:

The Porcupine Gold Mines.

Mine.	Daily Capacity, in Tons.	Present Rate.
Hollinger Consolidated	2,800	Half
Dome Mines, Limited	1,350	Closed
McIntyre-Porcupine	600	Full
Schumacher Mine	200	Closed
Porcupine-Crown	140	Closed
Porcupine V.N.T.	120	Closed
Dome Lake	100	Three-quarters.
Davidson Gold Mines	70	Full
Total	5,355	

Kirkland Lake Gold Camp.

Mine.	Daily Capacity, in Tons.	Present Rate.
Kirkland Lake Gold Mines, Ltd.	150	New
Tough-Oakes Gold Mines ..	140	Closed
Teck-Hughes Gold Mines ..	80	Closed
Lake Shore Gold Mines ...	70	Full
Total	440	

Boston Creek Gold Camp.

Mine.	Daily Capacity, in Tons.	Present Rate.
Miller Independence	40	Half
Patricia Syndicate	40	Closed
Total	80	

Munro Gold Camp.

Mine.	Daily Capacity, in Tons.	Present Rate.
Croesus Gold Mines	50	Closed
Hill Gold Mines	40	Closed
Total	90	

This gives the following grand total:

Porcupine	5,355 tons
Kirkland Lake	440 tons
Munro Township	90 tons
Boston Creek	80 tons
Grand total	5,965 tons

In the aggregate, just a little over one-third of the available milling equipment is being used at the

Northern Ontario gold mines as a result of the shortage of labor and high cost of supplies. Now that the peace conference between the Allies and their enemies will probably clear up any possibility of resumption of wars, and with an increasing demand for gold, it seems reasonable to expect the great majority of these mills will be worked to their fullest capacity some time during the coming year. All this points toward great prosperity at the gold mines during 1919 and the succeeding years.

Kirkland Lake Area is Being Successfully Developed.

In addition to the large way in which the Porcupine mines have developed, is the fact that success in the new Kirkland Lake field is second only to Porcupine. Two modern mills have been completed in this district during 1918, namely, at the Lake Shore Mines, and at the Kirkland Lake Gold Mines. The latter has just been completed and is being tried out this month, while that of the Lake Shore has been completed and in full operation since March 8th, last. Since that date, production has ranged from \$40,000 to \$45,000 monthly, and the average grade of ore treated has been around \$24 and \$25 to the ton. The company has disbursed two dividends, each amounting to $2\frac{1}{2}$ per cent. or \$50,000, or a total of 5 per cent., amounting to \$100,000. A mill with a capacity for 150 tons daily is proposed and will probably be constructed at the Wright-Hargreaves mine during the year 1919.

Rich Gold Tellurides at Boston Creek.

In the Boston Creek gold area the sensational development at the Miller-Independence Mines, where gold tellurides have been found to occur profusely in a large vein, has been one of the most interesting and important developments in years. This field constitutes the third best gold mining area in the province, as so far developed. Plans are being laid for aggressive development work at the Independence, and, from the manner in which the rich orebody is developing at the present time, there are reasons for anticipating exceedingly favorable results. Provided the company is able to announce having completed plans for operations on an extensive scale, not a few leading mining men who have had experience in fields where tellurides occur are of the opinion that extensive developments in this area will become general, and that the potentialities of such a deposit of gold tellurides are of the highest importance, so much so that it becomes very difficult to estimate. During the year a mill was constructed on the Patricia property, but owing to the shortage of labor has not been consistently operated. Before long, however, it is expected plans will be made for pressing it into service.

Outlying Fields Await Development.

In the outlying fields not much work was done during 1918. In the Lightning River district a shaft was driven to a depth of about 70 feet on a promising vein, but the costs of supplies when delivered at the property proved prohibitive, and work was suspended in November. Also, in the Fort Matachewan gold area a good deal of activity was shown early in the year. However, with the exception of the Otisse property, nothing extensive has been done. On the Otisse, thirteen diamond drill holes were driven and it has been stated officially that a large tonnage of ore has been

indicated. At the present time, plans are being considered with a view toward installing a mining plant and carrying on work in a large way. In the meantime a company known as the Matachewan Gold Mines Company, has been formed with a capitalization of 4,000,000 shares with a par value of \$1 each, for the purpose of developing the property.

Great Activity in Gold Mining in 1919.

The coming winter is expected to bring a favorable adjustment of working forces. The coming summer is expected to witness practically all the gold mines in full operation. Also, the coming summer is expected to be the most active summer in the prospecting field since the summer of 1914. The outlook, in every way, never appeared so bright for those who have pinned their faith and their fortunes toward the exploring and development of the great gold zone of Northern Ontario, which is already of world importance, and which bids fair to soon assume a leading place among the greatest of gold-producing areas.

DOMES MINES.

With the death of Captain J. R. DeLamar, of the Dome Mines, in New York this week, much speculation is rife regarding the effect his passing will have upon future operations of the big mine, which is conceded to be the second largest gold mine in the Dominion of Canada. It is understood the late president of the company left his affairs in such shape that no unusual disturbance of the affairs of the company is anticipated. The Dome mines will be the centre of increasing interest during the next few months, during which time the property is expected to reach a stage of capacity production once again. It is probable that these next few months will call for exceptional executive ability and able administration, by reason of the fact that it will be necessary to secure the services of a large staff of technically trained men, a task which entails the utmost care if the best interests of the company are to be served. The consensus of opinion appears to be that the first year following the recommencement of milling and mining operations on a large scale will provide many pleasant surprises for those interested in the great mine. Mr. J. S. Bache, of New York City, has been appointed president of the Dome Mines company to succeed Mr. DeLamar, and no doubt the affairs of the company are once again under able administration.

CONIAGAS DROPS OPTION ON ANKERITE.

According to recent word from Porcupine the Coniagas Mining Company has dropped its option on the Ankerite property there. During the currency of the option a large amount of development work was done on the property, and the prevailing impression had been that results being met with were of a very satisfactory nature. However, the option, on which a large cash payment is said to have accrued due the first of the current month, has been allowed to expire. In the meantime the Coniagas has moved its supplies and equipment to the adjoining Maidens-McDonald property which it owns and on which development work is to be conducted.

Cobalt Silver Mines in 1918 Produced 18,000,000 Ounces Silver, Valued at \$17,000,000.

By J. A. McRae.

One and a half decades have passed since silver was first discovered in Cobalt. As the year 1918, the fifteenth year of its productivity, draws to a close, it is evident the production for the year will be equal in value if, indeed, not in excess of any previous year.

Production for the year, it is now evident, has averaged about 1,500,000 ounces per month, and by the end of the current month will have reached an aggregate of approximately 18,000,000 ounces for the calendar year. The value of the output will be over \$17,000,000. Provided no change occurs within the next sixteen days in the quotations for commercial bar silver, the average for the full twelve months will be 96.69 cents per ounce. This compares with an average of 81.41 cents per ounce during 1917, and represents an increase of slightly over 15 cents per ounce. This 15-cent increase on a production of 18,000,000 ounces adds approximately \$2,700,000 to the year's production. It is now quite interesting to look back to the opening year of the war against Germany, when the price of silver fell below 50 cents an ounce, and at one time hovered around 48 cents an ounce, thus constituting approximately one-half the 1918 average. It is needless to emphasize what this doubling in price has meant to the Cobalt mines.

A Year of Steady and Successful Operation.

The year has not been marked by any particularly notable development, but has been one of consistent operation, marked by few particularly sensational successes and likewise only a few disappointments. The Nipissing, Mining Corporation of Canada and the Kerr Lake have been the leading producers, the two former companies producing somewhere around four million ounces each, and the Kerr Lake around two and a half million ounces. Other companies producing over one million ounces each are the O'Brien and the Coniagas. The Nipissing, with its large acreage of unexplored ground, has added a number of high-grade silver veins to the large number previously known. A more or less comprehensive plan of development is now taking place in addition to continuing normal production. This may reasonably be expected to bring in additional, and perhaps important, veins. Everything considered, there is reason to believe the Nipissing from now forward for several years will be able to lay claim to the distinction of being the largest silver-producing mine under the British flag.

Changes in Personnel of Companies.

Development work below the diabase sill at the Beaver Consolidated which, early in the year gave promise of adding greatly to the value of the mine as well as adding to the potential value of adjacent properties, does not appear to have been attended with the success at first indicated. The beginning of December found work suspended in the zone below the diabase sill. However, the lower workings were being kept pumped out and it is evident further work in that zone is contemplated. Early in the year Frank L. Culver, in control of the Beaver, and also formerly in control of the Temiskaming Mine, lost control of the latter, being succeeded to the presidency of the Temiskaming company by J. P. Bickell. Other changes in the personnel of the various companies included the appointment of T. R. Finnucane, former manager of the McKinley-

Darragh-Savage Mines, to the position of managing-director, and the promotion of J. C. McCloskey to the managership. Douglas A. Mutch resigned as manager of the Hudson Bay Mines, to take over the management of the Ankerite mine of the Coniagas Company. A. H. Brown, a former manager of the Hudson Bay, again entered the service of the company. J. W. Moffet, owing to illness, resigned from the Beaver, and L. W. Ledyard, a former manager of the Teck-Hughes mine, was appointed general superintendent of the Beaver. With the change of control at the Temiskaming mine I. S. McReavy was appointed manager. A number of other less important changes took place.

Prospecting on Non-Producing Properties.

A good deal of prospecting work has been done at a number of non-producing mines. Among these, the Adanac Silver Mines has made perhaps the largest and most consistent effort. During the year approximately one thousand feet of work has been done. A number of large veins were opened up. At the time of writing, very encouraging silver values are being encountered.

At the Ophir, a good deal of work has been done, but with not altogether favorable results. At the Gifford, considerable exploratory work has been carried on. The Cochrane property, adjoining the Temiskaming mine, was taken under option by the latter company a few months ago and is being explored through the workings of the Temiskaming. The mill of the Temiskaming was closed down last spring owing to ore reserves being low, and was re-opened a few weeks ago. The Foster property was leased in the early fall to C. L. Campbell and W. Fairburn. A shoot of high-grade ore was encountered which has yielded almost one carload of ore. The Trethewey company purchased the property of the Castle Syndicate, in the Gowganda district and is conducting development work with fair encouragement.

At the Peterson Lake an oil flotation plant was installed and has been working with good results for the past two months or more.

In the township of Bucke, some interest has been manifested during the current year. The former Green-Meehan Mine, now controlled and operated by Edwards & Wright, has yielded a large tonnage of low-grade ore together with an encouraging amount of high-grade. The Mining Corporation of Canada purchased a property in the late summer near North Cobalt, and has installed an electrically driven mining plant, and propose sinking a shaft to a depth of 300 feet. This work is being watched with a good deal of interest, in that any success here might reasonably lend value to a large area where rock formations are of a similar character as that upon which the Mining Corporation is conducting exploration work.

In South Lorrain.

In the South Lorrain area the Pittsburg-Lorrain Syndicate, having a lease on the Wettlaufer Mine and mill, as well as operating its own property, carried on work throughout the year, but, at the time of writing, has planned to close the mill during the winter. The Keeley mine is being worked in a small way, a carload of ore being sent out about the middle of November.

Cobalt Payroll, \$3,500,000; Power and Supplies, \$3,500,000.

Employing approximately 2,375 men, the payroll of the Cobalt mining companies has approximated nearly \$10,000 per day or about \$3,500,000 for the year. At least an equal amount, perhaps, has been paid out for

power and supplies. This appears to indicate a profit of upwards of \$9,000,000 for the year 1918, probably the greatest net profit ever realized in any previous year in the history of the camp.

There were times during the year when a number of the mines conducted operations with a deficiency of perhaps ten per cent. in the number of men normally required to operate to best advantage. Also there were times when more or less difficulty was experienced in securing the requisite supplies without expensive delays. These factors combined to reduce the efficiency which otherwise might have attained a higher plane. However, now that peace is in sight, and now that men are returning from the munition plants and seeking employment at the mines, the deficiency in numbers and efficiency may reasonably be expected to rapidly become adjusted.

Cobalt Has Produced 292,724,172 Ounces Silver Worth \$169,360,561.

The output of silver from the Cobalt mines has now reached the enormous aggregate of approximately 292,724,172 fine ounces with a value of about \$169,360,561. Before the middle of 1919 the output will pass the three hundred million ounce mark.

The following is Cobalt's record:

	Average price, cts. per oz.	Ounces.	Value.
1904	57.2	206,875	\$ 111,887
1905	60.4	2,451,356	1,360,503
1906	66.8	5,401,766	3,667,551
1907	67.5	10,023,311	6,155,391
1908	52.9	19,437,875	9,133,378
1909	51.5	25,897,825	12,461,576
1910	53.5	30,645,181	15,478,047
1911	53.3	31,507,791	15,953,847
1912	60.8	30,243,859	17,408,935
1913	57.8	29,681,975	16,553,981
1914	54.8	25,162,841	12,765,461
1915	49.69	24,746,534	12,135,816
1916	65.661	19,915,090	12,643,175
1917	81.417	19,401,893	16,131,013
1918	96.69	18,000,000	17,409,998

Totals 292,724,172 \$169,370,559

At the present rate of production, and with silver maintaining at its present price, it would require less than five more years to bring Cobalt's total to close to four hundred million ounces and with a total value of upwards of one-quarter of a billion dollars.

A Promising Future for the Cobalt Silver Mining Industry.

As for the future, with metal authorities predicting a continued high price of silver for several years, Cobalt's prosperity is expected to increase during the post-war era. The reasons are several. Chief among them is the fact that abundant labor will be available, and that the cost of supplies will decline. Indeed, there is already evidence of the commencement of this expected decline in costs. In recording the foregoing statement, that Cobalt's prosperity is expected to increase during the post-war era, it should perhaps be well to point out that such is not meant to convey the belief that the output of silver will increase. Quite to the contrary, there may reasonably be expected a slight decrease in output from year to year, but so slight, especially with silver at the present high quotation, as to convey no threat to the profitable existence of the mines for a great many years. A few of the mines will gradually reach the end of their resources, while others

may reasonably be expected to bring in new and hitherto unknown deposits, this to continue for many years. The increase in efficiency and the lower costs, for a considerable time should serve to offset any slight decline in output, and thus maintain profits, in the aggregate, at about the present level.

Casey-Cobalt.

A car-load of ore was shipped a few days ago from the Casey-Cobalt Mine situated in the township of Casey, about nine miles north-east from New Liskeard. The ore was shipped to Denver, Colorado.

Mr. Bruce White, one of the best known mining men in the Kootenay District the man who staked the Slocan Star, died at Nelson, B.C., recently.

R. K. Neill, the proprietor of the Bush Mines, Portland Canal District, B.C., is preparing for extensive development work. He is arranging for the purchase of horses and outfit to haul ore from the mines to the wharf. Meanwhile, everything possible is being done to complete road building.

IRON ORE ON BELCHER ISLANDS.

Iron ore of good grade is reported to have been found on Belcher Islands. Mr. Robt. Flaherty reported that the deposits examined by him were low-grade—38%. More recent discoveries, of which we show photographs, are said to be of higher grade. The ore is blocky hematite resembling that of Newfoundland. The photographs are furnished by Mr. Sainsbury, one of the discoverers. Mr. M. M. Gibson, of Toronto, has reported favorably on the property.

Iron Ore on Belcher Islands, Hudson Bay.

Coal Mining in the Province of Alberta in 1918.

Production Increased 20 Per Cent.

By John T. Stirling.

It is estimated that the production of coal in Alberta for the year 1918 will be slightly in excess of six million tons, and as the production for the year 1917 was 4,863,414 tons this means that there will be an increase during 1918, over 1917, of approximately 20 per cent. Exact figures are only available for the nine months ending September 30th, 1918, and these figures show that there were produced during that period 4,594,200 tons as compared with 3,182,826 tons during the same period in 1917.

Increased Quantity of Alberta Coal Sold in Canada.

It is gratifying to note that the market for Alberta coal has been extended to such an extent that 384,622 tons of domestic coal were shipped into the province of Manitoba during the first nine months of the present year as compared with 153,243 tons during the same period of 1917. The reason for this large increase is, of course, due to a great extent to the statement made several months ago, by the Fuel Controller of Canada, that shipment of anthracite coal from the United States to Canada would be very considerably decreased during 1918 and also to the fact that an extensive publicity campaign was started by the Provincial Government of Alberta warning consumers to put in their supply of fuel at the earliest opportunity. As a result of this campaign a great deal of fuel has been stocked throughout the western provinces, ready for use during the winter months, to such an extent that no shortage of fuel need now be anticipated in the provinces of Alberta, Saskatchewan and Manitoba, even although a severe winter is experienced.

Several new mines have been opened during the year and several abandoned, making the total number now in operation 263. There are employed at the present time 2,782 men above ground and 6,195 men underground.

Now that a great deal of the prejudice that has existed in Manitoba and Saskatchewan has been overcome it is to be expected that the market, which has been obtained in these provinces during the last few months for Alberta coal, will continue to increase.

There Is No Necessity of Importing Coal Into Prairie Provinces.

There appears to be no reason whatever why any coal should be imported from the United States into these provinces, unless in a few isolated cases where it would appear that small amounts of anthracite coal were essential.

Alberta Could Produce 9 or 10 Million Tons Coal Annually Now.

Although the output produced in Alberta has increased so considerably during the past few years, I am of the opinion that if the mines were worked steadily during the whole year without increasing the present labor employed and with the present amount of development work done that between nine and ten million tons of coal could be produced annually. This is a safe estimate, as during four or five months of each year 80 per cent. of the mines are idle owing to lack of orders. Even with the wide publicity that has been given the question of fuel during the last twelve months very few of the domestic coal mines in the province have worked to more than 50 per cent. of their capacity

during the months of September, October and November. The same conditions exist in the steam coal mines, although in a lesser degree and a number of the operators of these mines are becoming seriously alarmed regarding the outlook for market during the next few months.

MILLER-INDEPENDENCE.

According to advice received it has been planned to increase the capitalization of the Miller-Independence Mines of Boston Creek from 500,000 to 700,000 shares. This decision was reached by the directors at a meeting held in Dayton, Ohio, the early part of the current month. This has been made advisable owing to the large way in which the company's property is developing. Heretofore it had been planned to operate a 40-ton mill already installed, and in this small way work the rich deposit. Development work during the past few months, however, has entirely outgrown the present equipment. In order to facilitate the desired additions to the plant and mill, which will be increased to several times its present size, as well as improve transportation to the property and make available electric power, it was decided to increase the capitalization by 200,000 shares. The price at which the new stock will be issued has not been announced. In the meantime work at the property is going ahead unremittably.

Mr. Wm. Adams is in charge of surface and milling operations, while Mr. Jack Murphy, formerly of the Tough-Oakes Gold Mines, is superintending underground operations.

As the development of the property proceeds it becomes more apparent that a series of veins occur, the richness and extent of which only future developments will reveal. It has been expected that the number one vein which is dipping sharply to the north, would come in contact with the main vein at a depth of about 120 feet. However, the working has been carried to a depth of 200 feet on the main vein with no sign of the number one vein coming in. Between these two veins another strong fracture occurs, and it is now believed the number one vein joins this fracture and straightens up in conformation with its dip. It is thus thought that the number one vein which is narrow and dipping sharply to the north is but an off-shoot of a large fracture between the two veins being worked. Another interesting and important development is the fact that there is a good deal of the mineralization of the main vein of the Miller-Independence which was hitherto believed to be copper pyrites (chalcopyrite) has been found to be in reality a bronze-colored telluride. The first intimation of this was contained in an article written by W. E. Simpson in September, in which Mr. Simpson says in part: "In mines like the Miller-Independence, the ore, at present, seems rich enough to bear the expense of any method of treatment, no matter how costly. Fine bronze colored tellurides are scattered profusely through the selected pieces (meaning those pieces taken for analysis), giving them a coppery appearance, although no copper may actually be present." This bronze colored telluride occurs in close association with the heavy and extremely rich calaverite. The foregoing announcements prove the most interesting in connection with the development of the Miller-Independence since the early announcements of the striking of telluride gold ores on the property.

MINING OPPORTUNITIES IN NORTHERN MANITOBA

Mineral Areas

Approximately three fifths of the total area of Manitoba is Pre-Cambrian, and all but a small part lies in Northern Manitoba. In the Pre-Cambrian in Ontario, the well-known camps of Sudbury, Cobalt and Porcupine have been developed. In Northern Manitoba there was practically no prospecting until the Hudson Bay Railway gave access to the mineral districts. There are three fields in particular to which attention is now directed—The Pas Mineral Belt, the Cross and Pipestone Lakes area, and the Oxford Lake, Knee Lake, God's Lake and Island Lake area.

Development

Since 1915, development has been rapid in the Pas Mineral Belt. An extensive body of low-grade copper ore has been explored by diamond drilling at Flin-Flon Lake. High grade copper is exported from Schist Lake to the smelter at Trail, B.C.; three and three-quarter million pounds of copper have already been realized. Copper prospects are under development on Athapapuskow Lake, Copper Lake and Brunne Lake. The building of a smelter will give impetus to the development of a large copper industry. Gold is now produced at Wekusko Lake, and important discoveries have been made on Copper Lake, and on Knee Lake on the Hayes River route.

Transportation

Transportation is available by the Hudson Bay Railway, by the Ross Navigation Co. Steamboats on the Saskatchewan River, and by wagon roads built into the producing areas by the Manitoba Government. Wekusko Lake may be reached in less than one day from The Pas. The Hudson Bay Railway gives easy access to several promising districts where little prospecting has yet been done.

Mining Regulations

The mineral resources are under Federal control, and the Dominion Mining Laws apply to Northern Manitoba. No mining license is required. Work to the value of \$100 per year must be performed for a period of five years on claims filed under the quartz mining regulations. The office of the Mining Recorder for Northern Manitoba is at The Pas.

To Prospectors

The mineral areas in Northern Manitoba are virtually unprospected. Valuable discoveries both in copper and in gold have been made within the last few months. The opportunities for prospectors are exceptionally good.

For maps, reports and general information, apply to

**The Commissioner of Northern Manitoba,
The Pas, Manitoba.**

Mining in Northern Manitoba, 1918

By R. C. WALLACE, Commissioner of Northern Manitoba.

In Northern Manitoba there has been steady progress during the year. With the building of a railway and the erection of a smelter—and this should be well advanced before the close of another year—a large copper industry is assured. A detailed and fully illustrated article by J. A. Campbell, M.P., on mining operations and prospecting in this area was published in a recent issue (Nov. 1st) of this journal. It will, therefore, be unnecessary, in a review of the progress for the year, to do more than refer to some of the salient features.

Enormous Tonnage of \$10 Ore at Flin-flon.

On the Flin-flon property, diamond drilling was continued by the Fasken-Black syndicate until the end of June, when the preliminary work of mapping out the orebody was completed. The tenor of the ore is remarkably uniform, the average value being slightly less than \$10 per ton. Horseshoes of unmineralized rock occur throughout the orebody; and these, it is understood, have now been fully defined. Official figures are not to hand as to the total extent of the orebody, as explored by drilling, but the figure of 20,000,000 tons has been commonly quoted in this connection. The obstacle to development was the war situation. This obstacle has, happily, been removed, and development should now be rapid.

Mandy Mines Shipped 6,300 Tons Ore, Averaging Over 20 Per Cent. Copper.

At the Mandy mine, work has proceeded continuously though the labor situation made it difficult to maintain the necessary staff. Six thousand three hundred tons of ore were transported to Trail during the summer. Owing to the abnormally low water in the earlier part of the summer, steamboat navigation was difficult, and ore shipments came in slowly. The open season was, however, unusually prolonged, and transportation was possible till the beginning of November. A contract has been let for winter haulage of 10,000 tons to Sturgeon Landing, to be ready for water transportation next year. The tenor of the ore is slightly higher even than the shipment of 1917.

Other Copper Properties.

Diamond drilling has been continued by a Duluth syndicate on the Chica group, near the mouth of the Pine-root river. Important discoveries have been made in a new district on the northeast arm of Lake Athapapuskow. The ore consists of bornite and chalcopyrite, distributed through a sheared porphyry, and occurring also as stringers in the rock. Development work is proceeding to determine the average surface values. If sufficiently high, large low-grade properties will be opened up in this area. Extensive sulphide orebodies are also being prospected at Copper Lake, some

10 miles northeast of the discoveries on Athapapuskow Lake. In this field a spectacular gold discovery has recently been made by K. J. Peterson.

Rex Mine Begins Gold Production.

The province is now definitely a producer of gold. Up till the end of October, the returns from the Rex mill, at Wekusko Lake, which commenced operations in May, were approximately \$21,550. While the figures are not high, it is remarkable, nevertheless, that under present adverse economic conditions, and in face of a very seriously depleted labor supply, a gold mine somewhat far removed from transportation should be in a position to initiate and continue operations. During the winter a 30-ton Lane mill was installed, two amalgamating plates, two Deister Overstrom concentrators, one 60-h.p. engine, two 60-h.p. boilers and one 320 cu. ft. compressor plant. The returns are from the plates, the concentrates being stored till suitable machinery is installed. The shaft has been sunk 117 feet, the south drift at the 100-ft. level has been run 200 ft. and the north drift 90 feet. At present the ore is stoped from the north drift near the shaft. The vein continues to show an average width of 4½ feet, and the values are remarkably high. The prospects are favorable that this mine will become a large producer.

The Makeever Brothers, who have formed a company to operate the mine, took an option on the Dauphin-Elizabeth group, and sank a shaft to a depth of 50 feet. The option was not taken up, but The Pas Consolidated Mines, Ltd., have now begun operations on this property.

An option was also taken on the Northern Manitoba property, and a shaft has been sunk beyond the 100-ft. level, and some 50 ft. of drifting done at that level. This is a narrow vein, carrying very rich ore, and persisting practically without change as far as prospected. In places values also occur in the quartzite of the hanging wall when heavily mineralized with arsenopyrite and tourmaline.

Gold Quartz in Sheared Porphyry.

It is noteworthy that in at least three widely separated areas gold discoveries have been made which resemble one another fairly closely, and differ from the gold deposits hitherto prospected. They occur as series of stringers or veins of gold-bearing quartz in wide bands of sheared porphyry extending to 75 ft. in width. Two of these areas are in Northern Manitoba. P. Gasse discovered a deposit of this nature in a sheared zone in the granite at the north end of Wekusko Lake. This has been sampled to a width of 75 feet. On the north shore of Knee Lake, on the Hayes River route, a prospecting party under H. M. Paull, made two such discoveries in a sheared porphyry, mineralized with copper sulphides and arsenical pyrites. High values have been obtained on cross-channeling widths of 50 feet on both locations, presumably on the same line of shear. These latter deposits are of interest in that they will attract attention to the Keewatin belt which extends southward to God's Lake and Island Lake.

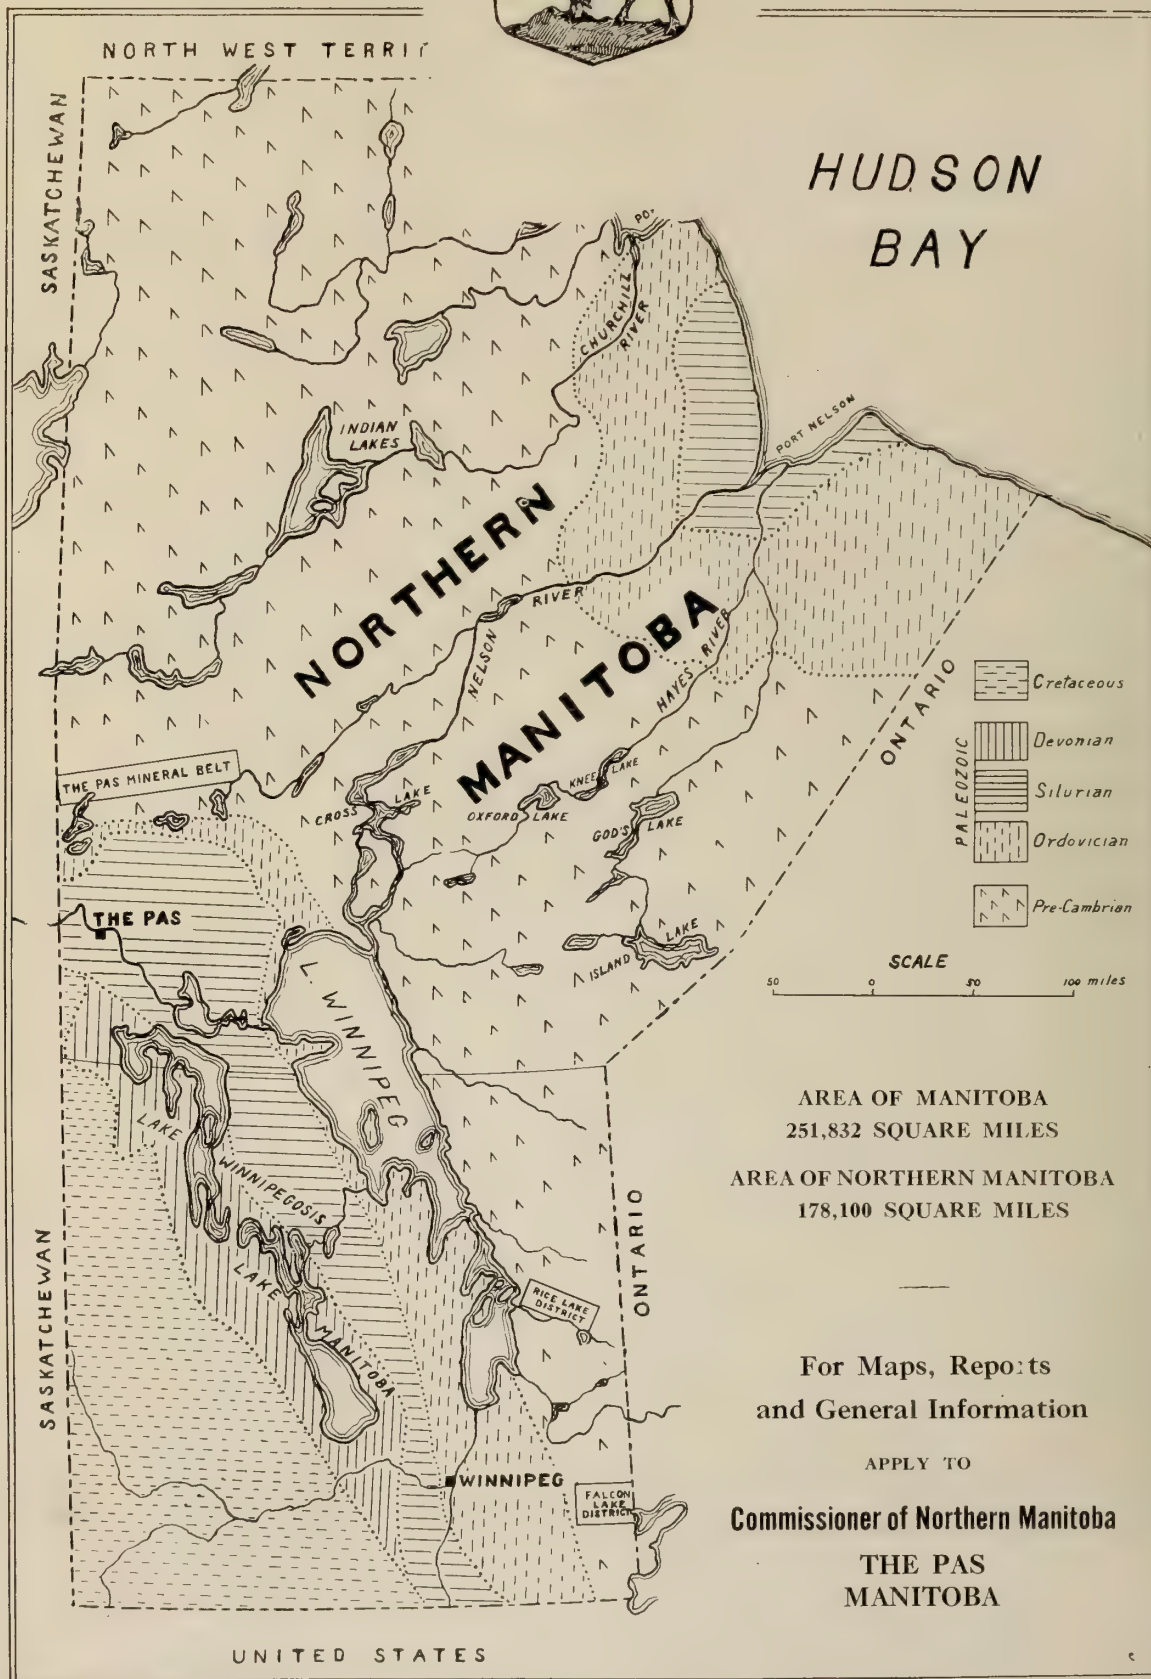

Copper Ore from Northern Manitoba

Copper and Zinc Ore from the Mandy Mine, Schist Lake, The Pas Mineral Area, Northern Manitoba.

The larger piece is chalcopyrite, such as is being mined. The ore shipped averages over 20% copper.

The smaller piece contains chalcopyrite mixed with sphalerite (zinc sulphide). This mixed ore is not being shipped.

GEOLOGICAL SKETCH MAP OF MANITOBA

BRITISH COLUMBIA IN 1918

By Robt. Dunn.

With the approach of the end of the year it is the custom to cast the eye back over the twelve months about to expire, with a view to ascertaining what has been accomplished in comparison with other similar periods. By this means it is possible to determine whether, in the particular industry under review, the country is making progress or otherwise. To no one is vouchsafed the gift of unerring accuracy in prophecy, but it is interesting, by taking the figures available and gauging the general conditions of the moment, to endeavor to arrive at some conclusion as to what the future is likely to hold for the special line of endeavor being discussed.

It is generally admitted that British Columbia is wealthy in its minerals. From the fifties of the last century it has been widely known as a mining province. Ever since the fame of the gold fields of the Cariboo District brought thousands of pioneer prospectors to the then unexplored and little-known Canadian West, British Columbia has been recognized as one of the most important of the mineral sections of the Dominion. Its output has steadily mounted and, though outstripped by the province of Ontario up to the present, there are many who predict that the time is coming when the Pacific Coast province will justify the faith of those identified with the development of its mineral by overcoming the lead now established, and obtaining and maintaining a comfortable margin.

When the war was declared in 1914, and various forms of mineral became an imperative necessity to the allied nations, this province, in common with all other mineralized sections of America, began to experience a stimulation of activity which made its mark on the annual production and, of much greater importance, brought home to local mining men and to outside parties interested in mining, a clearer conception of the mineral resources of the province. This advance in output continued until 1916, when the record of \$42,290,462 in mineral values was established. Then came the drop of 1917 with \$5,280,070 less, the total being \$37,010,392. Different explanations were given of this decline, chief among which were labor troubles, and those who discuss these matters, and whose judgment the general public has been educated to accept, ventured the opinion that, barring similar distressing experiences, it was likely that the 1918 production would come back to that of 1916. Will it? Were the predictions of those referred to sound and are they going to be borne out by the statistics that shortly will come to hand?

These are the questions which are being debated as the year draws to a close. They are subjects of much argument and much speculation.

Copper Production in 1918.

It is not the intention of the writer to venture, even now, on the quicksands of prophesy; but it may be said with reasonable assurance that British Columbia, when the books of 1918 are closed, having been audited and found correct, will be found with a copper production to her credit in excess of that of 1917, but possibly not quite up to the mark of the record year of 1916. This assertion is based on the figures available for the first nine months of the year.

Before going any further, it seems best to explain, as far as possible, the situation with regard to copper

production. In 1916 it totalled 65,379,364 lbs. and in 1917, 59,007,565 lbs. Official returns indicate that the Granby Consolidated Mining & Smelting Co., by far the largest producer of copper in the province, had turned out at the end of the month of September, or during the first nine months of the year, 29,081,635 lb.; the American Smelting & Refining Company at its Tacoma, Wash., smelter had produced from British Columbia ores over the same period, 16,344,376 lb.; and the Ladysmith Smelting Corporation, at its Ladysmith smelter, which now is closed down, had produced 96,212 lb. No advice has been received as to the results of the operations of the Consolidated Mining & Smelting Co. at its Trail Smeltery. The Northport Smelting & Refining Company reports that, at its Northport Smeltery, no British Columbia ores had been treated during the first three-quarters of the year. Therefore, the total output for nine months of 1918, of which there is knowledge, was 45,518,223 lb. Therefore, there must be produced in the last three months of the year 13,489,342 lb. in order to equal the mark of 1917. Simple figuring shows that the Granby smelters have been producing at the rate of 9,693,878 lb. a quarter and the Tacoma smelter at the rate of 4,086,094 a quarter. If they alone continue this pace until the close of the year the additional production will aggregate 13,779,972 lb. and the provincial production will reach at least 59,298,195 lb., or 290,630 lb. in excess of 1917. Working on the basis given the margin resulting is small; but it must be remembered that nothing is said of the Consolidated Mining & Smelting Company's production which, it is to be presumed, will not be inconsiderable. It is with these facts in mind that the prophecy is ventured that in copper, the back-bone of British Columbia's mineral industry, 1918 is likely to make a more satisfactory showing than the preceding year.

Silver, Lead and Zinc.

It is impossible to say much at the present moment with respect to the production of silver, lead and zinc. From general information it is surmised that silver will about equal in value the 1917 figure, but lead and zinc are likely to be somewhat below the previous year.

In explanation of these statements it can only be said that operations have been affected by the high costs and the difficulty of obtaining labor. These two factors, so pronounced throughout 1918, have had their influence on mining throughout British Columbia, as they have, no doubt, on the industry in other parts of Canada. Unquestionably the greatest producer of lead and zinc in the West is the Consolidated Mining & Smelting Co. at Trail. The story of the demand for zinc in the earlier days of the war is well known. It will be remembered that the price at one time advanced to 40 cents and all mining men in this section know that the Trail smelter management, because of the need of this metal for munition purposes and because of the high prices offering, installed an electrical plant, costing some \$2,000,000, for the purpose of recovering the zinc from the fractious ores of the Kootenays. At the high prices it was profitable; but whether the plant, under conditions of the day, is proving a commercial success, is another question. In fact, the company obtained from the Dominion Government a bonus on zinc production, to be applied should the price fall below a certain figure, and, no doubt, is now receiving assistance under this legislation in order that the industry may not receive a knock-out blow and in order that valuable experiments in the treatment of the

silver-lead-zinc ores of the Eastern Districts of the province may be continued. With these circumstances in mind, and having before us the recollection of the number of zinc plants which sprung up in the United States following the great call for the metal, and remembering that this company was not exempt from the problems of costs and labor, it cannot be supposed that its production of zinc in 1918 will prove to be record-breaking.

Investigation of Smelter Costs.

While referring to the Consolidated Mining & Smelting Company, it is apropos to state that it has been, and still is, rather a storm centre, so far as the mining fraternity of the eastern part of the province is concerned. The trouble is of long standing; in fact it was the subject of debate at the last session of the British Columbia Legislature when a motion was introduced to the effect that the affairs of the company should be subjected to rigid and thorough inquiry by a Board of Investigation clothed with authority to take evidence, examine books, etc. At the time, however, the Associated Boards of Trade of Eastern British Columbia had the matter up with the Dominion Government, having appointed a committee to apply the probe and having asked that the Federal Administration support their nominees in the work financially and, so to speak, morally. This being the situation, Hon. Wm. Sloan, Minister of Mines, suggested that it would be better to defer provincial action until it was learned what the Ottawa authorities proposed to do. On behalf of the Government he agreed that, should the committee be properly authorized, he would be glad to see that the province was represented and, on the report of this representative, it could be determined whether further provincial action was necessary. Shortly after, it was learned that the Dominion Government was glad to give the aforesaid committee moral backing, but hesitated as to finances. Further pressure, however, elicited this support as well, and now the committee is prepared to proceed. The Spanish influenza interfered with plans made recently; but the inquiry, it is assured, will be started at an early date. The committee's work is to establish whether the charges made by operators in the Kootenay and Boundary Districts that the rates imposed for treatment of custom ores at the smelter are unfair and unjustified. The smelter's customers allege that schedules issued during the year leave them little or no profit and that, in many instances, small operators are driven to close down their properties. Some take the extreme view that the smelter should be taken over by the Government. The smelter management, on the other hand, maintain that the schedule allows them the smallest possible margin for treating and marketing the ore purchased and that the changes made from time to time have been rendered necessary because of increased costs and by reason of fluctuations of market quotations. They declare that an impartial investigation is welcomed.

To revert to the question of production, the record of tonnage of ore received by the Trail smelter for treatment during the first ten months of the year possible is of some significance, especially with reference to zinc and lead, and to a lesser extent in regard to gold.

Gold Mines Suffered as in Other Provinces.

Before giving the figures, a word may be said as to gold, now that it has been mentioned. That the production of the placer grounds of British Columbia will show a decline, more or less marked, cannot be doubted.

The reasons for this are the same in this province as they are in all parts of America, viz., the fixed value of gold, high costs which are conservatively estimated to have advanced 60 odd per cent. in the West, and the scarcity of labor. In the Atlin District, for instance, it is said that it was very hard to obtain workmen at any price and, incidentally, one of the largest of the hydraulicking concerns of the camp, the Columbia Mines, Ltd., was obliged to close down and its plant was sold for a song to creditors. Indubitably this was the result of the difficulties enumerated—difficulties, as has been said, which have been common in all gold-mining centres and which led to a widespread and strongly supported agitation in the United States for the institution by the Government of a policy of subsidy or bonus in order that the industry might not languish and that the production of the precious metal so necessary in the re-adjustment of the world's credits, might be stimulated.

Ore Treated at Trail.

The Trail Smelter figures mentioned show that from January to October, 1918, inclusive, 271,417 tons of ore were received as compared with 327,639 for 1917, and 415,983 for 1916 (same period); that at the end of October, 1917, there were 148 mines shipping to Trail more or less regularly while on October 31st, 1918, the total of the mines that had shipped during the year was 122; and that in October, 1918, there had reached the smelter 26,042 gross tons of ore as compared with 49,975 tons for October of the previous year. The latter parallel, however, is scarcely fair, as October of last year was an exceptional month in point of receipts. The following table of gross tonnage receipts at Trail for each of the first ten months, 1916, 1917 and 1918, is interesting at this time:

	1916.	1917.	1918.
January	26,986	36,570	27,404
February	37,863	40,967	33,989
March	43,810	42,949	41,725
April	41,771	25,909	37,029
May	43,031	15,969	21,162
June	42,252	17,129	17,956
July	40,268	20,744	20,871
August	46,814	38,134	23,465
September	42,863	39,293	21,765
October	40,350	49,975	26,042
Totals	415,983	327,639	271,417

No. 5 Mineral Survey District.

No. 5 Mineral Survey District, which includes all the eastern part of the province, is in charge of Mr. A. G. Langley, the resident engineer, with headquarters at Revelstoke, B.C. It is the operating mines of this section which contribute much the greater part of the ore for the Trail smelter. Mr. Langley, in discussing the season's work, roughly compiles the tonnages of ore sent to Trail from the several mining divisions under his supervision as follows:

	1918.	1917.
Slocan	13,097 tons	27,657 tons
Ainsworth	16,249 "	9,105 "
Slocan City	157 "	199 "
Fort Steel	81,528 "	116,324 "
Windermere	2,339 "	2,211 "
Nelson	3,934 "	8,108 "
Golden	803 "	272 "
Trail Creek	105,897 "	97,717 "

Thirty-four properties, which made small shipments in 1917, are listed as having dropped from the shipping list this year.

The resident engineer, in going into details, states that the Slocan, and especially the Sandon Camp, is enjoying more activity than has been experienced for a number of years. The closing down of the Standard Mine, he declares, is likely to result in a decrease in tonnage production in 1918 from this particular part but "other developments which are now taking place will tend to make future shipments from this district compare favorably with those of former years." On the other hand, the Ainsworth District has had a banner year and the production will greatly surpass that of the past. The same is the case with the Slocan City Division, while the Fort Steele Mining Division probably "will show an increase in gold production, on account of the recent hydraulic work and possibly a slight decrease in silver, lead and zinc." Referring to other mining divisions, he asserts that Windemere and Golden will show slight increases, that Nelson's output will be about the same as last year and that the returns from other districts will compare favorably with 1917.

Concluding, he remarks that "generally speaking, I would consider that there has been actually more prospecting done this year than last."

No. 6 Western Mineral Survey District.

Mr. Wm. Brewer, resident engineer in charge of Western Mineral Survey District, No. 6, which embraces Vancouver Island and a part of the lower mainland, mentions twenty-one properties within his purview on which new work either is in progress or is contemplated. In this district there has been one new metalliferous shipping mining property developed during the year. It is the bog iron deposit situated near Mons on the Pacific Great Eastern Ry., and is sending ore to the Irondale smelter for fluxing purposes.

North-eastern District.

In discussing mining conditions in the North-eastern District, Mr. J. D. Galloway, district engineer, observes that the scarcity and high price of labor, the high cost of mining supplies, especially powder and machinery, and the reluctance of capitalists to invest in purely speculative mining development has retarded progress during the past year. He adds, however, that there is a large virgin field in the North-eastern District for prospecting and undoubtedly when men return with the declaration of peace, prospecting, which now has practically ceased, will again be revived and many new discoveries may be made. He enumerates twelve properties on which development work is under way.

North-western District.

Mr. George Clothier, resident engineer North-western District, speaks of fifteen properties which are being opened up in the further development, in some of which plant is to be installed.

In No. 3 District, of which Kamloops City is the centre, Mr. R. W. Thompson, the resident engineer, enumerates fourteen properties on which new work is being done.

There has been considerable activity in No. 4 District, Boundary Country, of which Grand Forks may be styled the hub and over which Mr. P. B. Freeland presides as resident engineer.

Good Progress in Coal Mining Industry.

It is possible to speak of the coal production of

British Columbia during the past twelvemonth with enthusiasm and to view the future with optimism. The gross tonnage output up to the end of October was 2,204,255 tons, the results of the month of October giving the encouraging total of 217,482 tons. Place this beside the aggregate for 1917, which was 2,398,715 tons, and it will be readily seen that, with two more months to go at the time of writing, the prospects are that 1918 will show an increase over the previous year and possibly top the record of 1916, which was 2,485,580 tons. To reach the 1917 aggregate, 194,460 tons have yet to be mined. Certainly this should be achieved, providing nothing serious happens in the interim, and it would seem safe to predict that the province will show an output at least a quarter of a million tons in excess of the previous year.

This is especially gratifying as the operators throughout the province have been confronted with problems, not alone of costs and labor, but of the necessity in some instances of opening new mines to replace those that have become exhausted and to maintain the output. Mines closed down include No. 4, Extension B.C., Canadian Collieries (D) Ltd., and Nos. 1 and 2 Slopes, of the Pacific Coast Collieries, South Wellington. In the former case the Canadian Collieries immediately arranged to maintain their tonnage by opening No. 5 Mine at South Wellington, which now is in operation and making a first-class showing.

The Pacific Coast Collieries, on their part, are maintaining Nos. 3 and 4 shafts, Morden Mine, South Wellington Colliery, from which they are obtaining good results. The British Columbia Coal Mining Co., in October of 1917, had its Jingle Pot mine closed down by the inspector of mines because of an outbreak of fire. It was not re-opened until a short time ago, but now its tonnage is slowly advancing. On the other hand, the companies have had an accession to their ranks in the Granby Consolidated Mining & Smelting Company's new colliery at Cassidy's, Vancouver Island, the production of which now has reached quite a respectable total. Development work, too, has been undertaken by the old concerns.

B.C. Coal Output Statistics for the First Nine Months of 1918.

Island Fields.

	Output, 1917, Jan.-Sept. inclusive. (Tons.)	Output, 1918, Jan.-Sept. inclusive. (Tons.)
Canadian Western Fuel Co.....	472,656	563,605
Canadian Collieries (D), Ltd. (Cumberland)	387,172	419,516
Canadian Collieries (D), Ltd., (Extension)	218,223	173,429
Canadian Collieries (D), Ltd., (South Wellington, new mine)		11,951
Pacific Coast Coal Mines, Ltd. ...	120,448	70,385
B.C. Coal Mining Co.	61,065	3,673
Nanoose Colliery Co.	15,583	25,083
Granby Cons. Mining & Smelting Co. (Cassidy's)		10,195
Totals	1,275,147	1,277,847
Island increase up to end of September, 2,700 tons.		

Crowsnest Field.

	Output, 1917, Jan.-Sept. inclusive. (Tons.)	Output, 1918, Jan.-Sept. inclusive. (Tons.)
Crow's Nest Coal Co. (Coal Creek)	216,778	319,209
Crow's Nest Coal Co. (Michel)	76,054	157,290
Corbin Coal & Coke Co. (Corbin)	57,348	95,511
Totals	350,180	572,010

Crowsnest increase up to end of September, 221,830 tons.

Nicola-Princeton Field.

	Output, 1917, Jan.-Sept. inclusive. (Tons.)	Output, 1918, Jan.-Sept. inclusive. (Tons.)
Middlesboro Colliery Co. (Merritt, B.C.)	57,860	79,542
Fleming Coal Co. (Merritt)	7,439	22,451
Merritt Colliery (Merritt, not now operating)	9,345
Columbia Coal Co. (Coalmont, B.C.) new mine	2,985
Princeton Coal & Light Co. (Princeton)	31,544	31,688
Telkwa (new mine)	150
Totals	106,158	136,816

Nicola-Princeton increase up to end of September, 30,658 tons.

Total increase in tonnage, 255,188.

The tonnage returns for the month of September showed a decline of 75,777 tons as compared with the results during August. The trouble in September was the strike at Fernie and Michel, B.C., when the mines were closed down, the men striking for a Single Shift as the only satisfactory means of adequately safeguarding the dangerous condition of the mines. The production of the Crowsnest Pass Field was seriously affected. The chart shows that the output in this section had declined steadily from the beginning of the year to the end of August, at which point it takes a decided slump, no less than 60,000 tons of coal being lost because of this difference between the miners and their employers. Whether the mines were in a dangerous condition, which condition would be improved by the Single Shift System, remains to be demonstrated by Royal Commission, it being provided under the terms of the agreement by which the mines were re-opened in accordance with the men's demands that the point indicated should be subject to inquiry on the part of such a body. The personnel of the Commission, however, has not yet been announced, but is expected to be made known very shortly. The tonnage total also was influenced during September by the fact that there were more than the usual number of off-days, there being Labor Day, five Sundays, a thirty-day month, as well as the Nanaimo accident, in which sixteen miners lost their lives when the hoisting cable in No. 1 Shaft, Protection Western Fuel Co., broke and let a descending cage crash through the heavy timbering at the bottom, carrying its passengers to a terrible death. The months of October and November have developed their particular trouble for the operators who are striving to maintain the pace set early in the year and to establish a record for 1918. It is the influenza plague. And

while there is a disposition to treat this matter lightly, its seriousness in the coal mining camps of this province cannot be questioned. The production of the Canadian Western Fuel Company, Nanaimo, B.C., for October was 59,219 tons. This is the total for 27 working days as against 61,200 tons for 25 working days in September. Compare those two figures and some idea is obtained of the ravages of the epidemic among the miners. Clearly it has reduced this company's daily results by about 300 tons, which, it will be admitted, is no inconsiderable amount in the aggregate. And from authoritative reports the same difficulty not only is being met with in other Island camps but is being experienced at present in somewhat accentuated form in the Crowsnest Field.

War Minerals.

There are two points to which attention should be directed in concluding a summary of the year's mining activity in the province of British Columbia. One is that the pressure of the war brought to light some of the minerals of which little was generally known until their necessity for munition purposes was emphasized. Most important of these is manganese, of which several most promising deposits have been located in the Cowichan District, Vancouver Island, and no doubt will be developed without loss of time. Chromite, also, has been discovered and, although nothing can be said as to the extent of the deposits, those which have been recorded in No. 4 Mineral Survey District, near Midway and on Scotty Creek, north of Ashcroft, are said to be encouraging in their indications. Then there is a very promising molybdenite property at Alice Arm; scheelite in the Cariboo District, near Barkerville; and platinum on the Tulameen River and in some placer ground of the northern country. With respect to the Tulameen placers the Dominion Government has been prospecting bed-rock at several points, using a Keystone drill for the purpose, and good results have been obtained.

Bright Outlook for Coming Year.

The second point is that the future is bright and is so considered by all identified with the industry. The catch phrase that "the mineral resources of the country have but been scratched" can be applied to this province literally and without exaggeration. Naturally, problems are constantly becoming apparent, the annual output fluctuates considerably, but the upward curve, as will be shown by a glance back over the records, has been steadily maintained. In the last few years this tendency has been more marked and it is the consensus of opinion that, with the return to normal conditions now that peace is in sight and the demands of the reconstruction period at the threshold of which we stand, the mining industry of the province is bound to come into its own.

KIRKLAND LAKE GOLD.

Considerable delay, occasioned by the shortage of labor has retarded development and construction work at the Kirkland Lake Gold property of the Beaver Consolidated Mining company. Construction work on the new head frame at the central shaft is well under way however, and the structure should be completed this month. This headframe will be 80-feet in height and when completed everything will be in readiness for the commencement of production in the new 150-ton mill, which is now being tuned up.

THE COAL TRADE OF NOVA SCOTIA IN 1918

By F. W. Gray.

The trend of the coal industry in Nova Scotia is indicated by the subjoined tabulation. The figures given for 1917 and 1918 are closely approximate, and an attempt is made to forecast the probable production of 1919. In last year's Review the writer forecasted the 1918 production as likely to be—barring accidents or stoppages of work—in the vicinity of 5,300,000 tons. A reduction of about 100,000 tons was caused by the explosion at the Allan Shaft early in the year. With the exception of a strike at the Pictou Collieries during the summer, which lasted a fortnight, there were no other notable interruptions to production.

Coal Outputs in Nova Scotia (Tons of 2,240 lbs.)

Tons	Percentage from Cape Breton Island per cent.	Percentage from Main- land Mines per cent.	Percentage of Reduction from the basis of 1913 per cent.
1913 ... 7,263,485	81½	18½	...
1914 ... 6,650,031	81½	18½	8½
1915 ... 6,709,951	82½	17½	7½
1916 ... 6,171,424	81¼	18¾	15
*1917 ... 5,667,000	77¼	22¾	22
*1918 ... 5,175,000	77¾	22¼	29
†1919 ... 5,100,000	77½	22½	30

*Approximate.

†Estimated.

The production for 1919 has become a factor of greater uncertainty because of the suspension of hostilities and the probability of a return of the soldiers to work, but it would appear probable that the decline in production will continue during the first half of 1919, and that the outputs may commence to increase by the summer, when presumably some of the soldiers formerly employed as miners will have returned to the collieries.

Some difficulties may arise whenever the soldiers commence to return in large numbers if they should apply for work at the collieries, at least so far as those men are concerned who cannot work at the production of coal at the coal-face, either because of inability or because they prefer other work around the collieries. At the present time, and throughout the greater part of the war period, the restricted production, and in a great part the increased cost of mining also, has been attributable to a shortage of skilled miners and face-workers. There are employed at the collieries a disproportionately large number of non-producers, and before any more men of this class can be employed, and indeed before the men now working in this class can be employed to their full efficiency, it will be necessary to augment the number of producers. These men are most badly needed, but they are needed in advance of any general increase of the colliery working forces, and there may be misunderstanding, or worse, when the soldiers return and apply for work at the collieries, unless this condition is thoroughly understood. If the shortage in producers can be made up, presuming a sufficient market for coal, then outputs can be increased, costs can be decreased, and employment can be given to men who otherwise will be out of work. But it should be realized that as the enlistment of men from the collieries was of a discriminating character, seeing that it was largely confined to the producing class, so must the re-employment discriminate against non-producers until the existing disproportion is remedied.

It cannot be claimed that the future of the coal industry in Nova Scotia is encouraging. Because of the operation of adverse factors, which were fully dealt with in the 1917 review, the coal operators find themselves confronted with a labor shortage, war-time wages, a permanently increased getting cost, and collieries that are either approaching exhaustion, or are incapable of producing the pre-war outputs because of the arrested condition of their underground development, brought about by a labor shortage extending now over a full three years.

The actual cost of mining coal in Nova Scotia exceeds greatly the maximum selling prices allowed by the United States Fuel Administration at the bituminous mines in that country. In some instances it costs twice as much to defray the bare outlay on wages and materials as the maximum pit-mouth selling prices just referred to. The bituminous coal production in the United States to-day is in the neighborhood of 700,000,000 tons annually, and an increase of 18 per cent. over 1917 figures has been achieved. The coal production of Nova Scotia now barely exceeds 5,000,000 tons per year, and it shows a reduction from 1917 figures of about 9 per cent.

For the first time it appears probable that Nova Scotia will fall behind Alberta in coal production, for, in the expectation of the Chief Inspector of Mines for that Province, Alberta is looking towards a production of 6,000,000 tons in 1918.

The position of the Nova Scotian coal industry has latterly been obscured by the dominance of the steel industry, because the percentage of the coal output used in steel manufacture is now so great as to have made the production of coal for domestic uses a secondary consideration. So long as the steel trade continues profitable this condition of affairs may continue, but it will eventually become plain that the coal industry itself is the basis of industrial prosperity, and the coal industry cannot be regarded as stable unless in addition to supplying the steel industry with the required fuel, it can also provide the railway, shipping, factory and domestic requirements of the accustomed distribution area of Nova Scotian bituminous coal. At the present time this is not possible, and unless the coal operators of Nova Scotia are resigned to going out of business entirely they must speedily take steps to increase the coal production, for only by increased production can the cost of extraction and marketing be reduced to figures that will permit of sales being made in competition with United States fuel, just so soon as the present coal shortage passes away.

The miners of Nova Scotia, so far as they are represented by the Amalgamated Mine Workers of N. S., have announced their intention to demand a substantial increase in wages at the end of the year, an increase which will be cumulative upon advances since 1916 totalling from 75 to 100 per cent. The miners' leaders state they wish to be paid wages on a scale as high as that of the highest paid miners on the Continent, but it is quite certain that if the miners of Nova Scotia wish to be paid the same wages as it is claimed are earned in some of the States, they will have to move to the States, because there is no blinking the fact that the extraction of coal in Nova Scotia is pursued under natural conditions that make the cost of mining much higher than in the United States, and this handicap must be accepted by all who engage in the industry. Miners' wages in Nova Scotia have reached, if they have not exceeded, the maximum burden that the economic limitations of the industry will allow.

The long-standing wage agreement between the Dominion Coal Company and its mine workers expires at the end of 1918, after having run continuously—with supplements and modifications—for a period of fourteen years. This agreement, while existing only between the Dominion Coal Company and its employees, has really dominated the wage agreements elsewhere in Nova Scotia.

In view of the critical stage at which the coal industry has arrived it is to be hoped that wise and moderate counsels will prevail in negotiating a new wage agreement, because it is to be doubted whether since the era of depression in the coal trade that paved the way for the formation of the Dominion Coal Company twenty-five years ago has the outlook of the industry been so uncertain. In fact the logic of events will eventually force the coal operators, as it did in 1893, to realize that in consolidation of interests lies the only hope of healthy survival.

SPECIAL CORRESPONDENCE

Kirkland Lake.

Interest is increasing in the southern section of the Kirkland Lake Gold Area, the chief properties in this section are the Ontario-Kirkland, Canadian-Kirkland and Hunton-Kirkland properties. Interest attaches to the Ontario-Kirkland through the fact that the company expect to have their new \$15,000 mining plant in operation by the middle of the current month, when the work of sinking the main shaft to a depth of 300 feet will be proceeded with at once.

Mr. D. Angus, of the Right of Way Mines, Cobalt, and Mr. George E. Drummond, of Montreal, are understood to be negotiating for purchase of control of the Canadian Kirkland, which is located a short distance south of the Kirkland Lake Gold property, and to the west of the Ontario-Kirkland. The Canadian-Kirkland occupies a leading place among the undeveloped properties of the Kirkland Lake Camp. A number of large well-mineralized veins have been opened up with the limited amount of development work already done. Two of these veins have been found to contain free gold and the assays as a result of careful sampling show a very encouraging grade of ore. The geology of the property is exceedingly favorable for the deposition of commercial ore bodies.

Negotiations involving purchase of control of the Hunton-Kirkland are also under way. Exceedingly rich specimens of gold ore were taken from the Hunton-Kirkland property in the early days of the camp from the surface workings. Just prior to the outbreak of war, the property became involved in a deal with English interests.

Lightning River

The case heard recently before Mining Commissioner T. E. Godson, K.C., regarding the claims in the Lightning River district known as the Howie Cochenour has been dismissed. Mr. R. N. Austin entered claim against W. M. Cochenour, L. B. Howey, M. R. Howey and George F. Martin for an interest in the claims above referred to, but the claim was disallowed. Work at the property has been suspended for the time being at least, owing, it is said, to the difficulties and high cost of transportation. It is understood that while good encouragement has been met with, the cost of operation has led to the discontinuing of the work. It required about four days for a team of horses to

make the road trip from the railway to the mine with about half a ton of supplies. Whether or not plans are being made for a resumption of work at some later date has not been announced.

Hollinger Makes New Record.

It is evident the output of the Hollinger-Consolidated for the year 1918 will exceed \$6,250,000. This entirely eclipses any previous records of the company and is the greatest yearly production from any precious metal mine in the Dominion of Canada. This is all the more remarkable when the prevailing conditions regarding gold mining in general are taken into consideration, scarcity of labor and high cost of materials of all kinds. The Hollinger has been operating with but about half the men required and utilizing about half of their large milling equipment. During the year several miles of new underground work has been done, during the course of which a number of large and important ore bodies have been added to those previously known and a large amount has no doubt also been added to the already huge ore reserves. The 425 foot level continues to constitute the main source of ore supply. The property is developed in such a manner as to permit of great economy in mining. All levels above the 425-foot might be termed auxiliary levels, as all the ore from these workings finds its way through various passes to the main haulage way where it is loaded onto cars and conveyed by electric power to the main shaft and hoisted to the mill for treatment. Not far under 1,500 tons of ore are hoisted at the property every twenty-four hours or approximately 45,000 tons per month. Under normal conditions and working the property to full capacity the amount of ore hoisted annually will probably be about 1,000,000 tons. It is estimated that the monthly output of the mine has been around \$520,000 with a net profit of about not far under \$300,000, for at least a few of the twelve months. It will probably be some little time after the close of the year before the official statement of the company will be available and the result of operations in detail made known. However, from a careful study of the statistics available it is expected that the net earnings of the company will be about three million dollars or equal to about 11 per cent. on the issued capital.

With the prospects of sufficient labor to operate at capacity early in the new year, it would appear that 1919 has great possibilities of showing an even greater production.

To Drill O'Donald Claims.

Arrangements are said to have been completed for the commencement of a diamond drilling campaign on the O'Donald claims at Boston Creek. The full extent of the work planned has not been made known yet. The O'Donald claims have been under option to various interest since the commencement of development of the Boston Creek area, and are said to have much merit. They are well located and should benefit materially from work being done on properties in the immediate neighborhood.

Tellurides on Campbell Claims, Catherine Township.

Very satisfactory results are attending development work on the Campbell claims in Catherine township near the Miller-Independence. The claims are situated in a direct line with what is considered to be the strike of the main vein of the Miller-Independence. One strong vein opened up on the property contains tellurides as well as visible gold. The property is owned by Duncan Campbell of Haileybury.

Cane Silver.

Trouble appears to be brewing for the Cane Silver Mines, Limited, with property situated in the township of Cane, near Kenebeck Station, on the Elk Lake branch of the T. & N. O. railway. In 1913 the property was optioned to Col. D. B. Shepp, of Philadelphia, at which time considerable surface exploration was done and a shaft sunk to a depth of 50 feet. While a good deal of encouragement was met with, the ore deposition was found to be erratic and the option was allowed to expire. Since that time various interests have had the property under exploration, but without success in the finding of silver ore in commercial quantities. The Trethewey Company of Cobalt held an option on the property for a short time recently, but decided not to exercise it. Toronto interests later organized a company known as the Cane Silver Mines Company, to operate the property. It now transpires that the latter company propose granting a ten-year option on the property with the privilege of renewal for a like period to other interests. The original owners of the property, who are Elk Lake men, appear to be opposed to such action and reports state that they are preparing to endeavor to prevent the consummation of such an agreement.

Silver was first discovered in this part of the township of Cane in the spring of 1913. The most consistent effort to develop the property was while under lease to Col. Shepp, since which time operations have never been continued for more than a few weeks at a time. One large aplite vein was opened up on the surface; in which leaf silver was to be seen, while a number of narrow veins carried spectacular samples of native silver.

Paragon-Hitchcock.

One machine and one shift of men is engaged in development work at the Paragon-Hitchcock property near Elk Lake. Since October 1st about 130-feet of lateral work has been done at the 100-foot level. Results met with are said to have been promising.

Plans are said to be under way for the resumption of operations at the property of the Moosehorn Mines. It is announced that endeavors are being made to secure the necessary capital to commence work again in February. In the early days of the Elk Lake boom, two or three shipments of high-grade ore were made from this property. Work at this time was confined principally to surface exploration, no effort being made to work the claims at depth.

Foster Mine.

From present indications the ore shoot encountered

some time ago at the Foster property will produce about one car-load of high grade ore. The ore is exceptionally rich and will make up a very valuable consignment. At the time of writing the high grade has disappeared from the vein in the face of the drift. The working however is being continued with the expectation of encountering a recurrence of the rich deposit. The vein is showing in the roof and floor of the drift, and a good deal of ore still remains in place.

STEEL PLATE WORK OF ALL SORTS

Boilers, for heat or for power purposes, any style you want.

Smokestacks, Smoke Pipes and Smoke Breeching.

Steel Flumes for water power.

Steel Pipes, any size, for any purpose.

Steel Tanks, any size or style, for air, water, gas, oils, gasoline, acids, etc.

Steel Bodies for Mine Cars.

Storage Tanks, for any class of material.

Blast Furnace Shells.

Boot Tanks for protecting machinery.

Ore Bins and Ore Bin Gates.

Ore Hoppers and Chutes.

Salamanders for warming air before compression.

Steam Jacket Kettles.

Steel Ladles, any size, for molten metals or slags.

We are prepared to build anything you may want made of steel plate, or to make repairs to your present plant.

Marsh Engineering Works, Limited, Belleville, Ont.

Established 1846

OBITUARY.

Harry P. Corliss.

Dr. Harry P. Corliss, Chemical and Metallurgical Engineer with the Metals Recovery Company, died on November 16th, at the age of thirty-two years, at Ray, Arizona. His death was the result of pneumonia following influenza.

In 1910 Dr. Corliss received the degree of Bachelor of Science in Chemical Engineering at New Hampshire State College. He then continued his studies at the University of Toronto for two years, specializing in physical and organic chemistry. At the end of this time he accepted a position as Industrial Fellow in the Mellon Institute of Industrial Research, Pittsburgh, Pa. In 1913 he received the degree of Doctor of Philosophy at the University of Pittsburgh.

Dr. Corliss' work at the Mellon Institute extended over a period of five years. During most of this time he was engaged in research upon metallurgical problems. The research resulted in several important improvements upon the flotation process for the recovery of minerals. Perhaps his most notable contribution to this industry was his discovery of alpha-naphthylamine as a flotation agent. It is too early as yet to estimate the full value of the discovery to the metallurgical world, but the results already obtained with it justify the belief that Dr. Corliss' work will one day be recognized as being of first importance in this field.

In 1917 he accepted a position with the Metals Recovery Company in order to initiate the large-scale application of his discoveries. In this work he was uniformly successful and was rapidly making for himself an enviable reputation as a metallurgical engineer when death called him.

Oxy-Acetylene Welding and Cutting

Oxy-Acetylene Cutting Saved 6 Days on this Job

When a severe wind-storm wrecked several big dock sheds on the waterfront of a large Southern city, 1,400 tons of steel were twisted into the entangled mass shown in this illustration.

Orders were given to remove debris in 24 days to make way for new sheds.

By means of the Prest-O-Lite Process of Oxy-Acetylene cutting, all wreckage was cut up and removed in 18 days—6 days ahead of schedule.

For speed and economy, this process is far superior to any other. Cutting metal by the old-fashioned hand method is slow, laborious and expensive.

It will pay YOU to know the savings and advantages that

Prest-O-Lite PROCESS

makes possible in Welding as well as Cutting. For manufacturing and all classes of metal repairing, the Prest-O-Lite Process has proved its value and economy.

The Prest-O-Lite Process employs both gases (acetylene and oxygen) in portable cylinders.

Prest-O-Lite Dissolved Acetylene is backed by Prest-O-Lite Service, which insures prompt exchange of full cylinders for empty ones. Provides dry, purified gas, insuring better welds, quicker work and lower operating cost.

Apparatus consists of an equal pressure blow pipe, automatic regulators and gauges, and all necessary equipment. Adaptable for oxy-acetylene cutting by the addition of special cutting blow pipe.

Thorough instructions are furnished free to every user of Prest-O-Lite Dissolved Acetylene. Any average workman who understands metals can learn the welding process quickly and easily.

We will gladly send illustrated literature and interesting data showing actual instances of savings made by others. It may suggest valuable ideas to you. Write for it.

Address Department C-108.

PROVINCE OF QUEBEC

MINES BRANCH

Department of Colonization, Mines and Fisheries

The chief minerals of the Province of Quebec are Asbestos, Chromite, Copper, Iron, Gold, Molybdenite, Phosphate, Mica, Graphite, Ornamental and Building Stone, Clays, etc.

The Mining Law gives absolute security of Title and is very favourable to the Prospector.

MINERS' CERTIFICATES. First of all, obtain a miner's certificate, from the Department in Quebec or from the nearest agent. The price of this certificate is \$10.00, and it is valid until the first of January following. This certificate gives the right to prospect on public lands and on private lands, on which the mineral rights belong to the Crown.

The holder of the certificate may stake mining claims to the extent of 200 acres.

WORKING CONDITIONS. During the first six months following the staking of the claim, work on it must be performed to the extent of at least twenty-five days of eight hours.

SIX MONTHS AFTER STAKING. At the expiration of six months from the date of the staking, the prospector, to retain his rights, must take out a mining license.

MINING LICENSE. The mining license may cover 40 to 200 acres in unsurveyed territory. The price of this license is Fifty Cents an acre per year, and a fee of \$10.00 on issue. It is valid for one year and is renewable on the same terms, on producing an affidavit that during the year work has been performed to the extent of at least twenty-five days labour on each forty acres.

MINING CONCESSION. Notwithstanding the above, a mining concession may be acquired at any time at the rate of \$5 an acre for SUPERIOR METALS, and \$3 an acre for INFERIOR MINERALS

The attention of prospectors is specially called to the territory in the North-Western part of the Province of Quebec, north of the height of land, where important mineralized belts are known to exist.

PROVINCIAL LABORATORY. Special arrangements have been made with POLYTECHNIC SCHOOL of LAVAL UNIVERSITY, 228 ST. DENIS STREET, MONTREAL, for the determination, assays and analysis of minerals at very reduced rates for the benefit of miners and prospectors in the Province of Quebec. The well equipped laboratories of this institution and its trained chemists ensure results of undoubted integrity and reliability.

The Bureau of Mines at Quebec will give all the information desired in connection with the mines and mineral resources of the Province, on application addressed to

HONOURABLE HONORE MERCIER,
MINISTER OF COLONIZATION, MINES AND FISHERIES, QUEBEC.

The Minerals of Nova Scotia

THE MINERAL PROVINCE OF EASTERN CANADA

COAL, IRON, COPPER, GOLD, LEAD, SILVER, MANGANESE, GYPSUM, BARYTES, TUNGSTEN, ANTIMONY, GRAPHITE, ARSENIC, MINERAL PIGMENTS, DIATOMACEOUS EARTH.

Nova Scotia possesses extensive areas of mineral lands and offers a great field for those desirous of investment.

Coal Over six million tons of coal were produced in the province during 1916, making Nova Scotia by far the leader among the coal producing provinces of the Dominion.

Iron The province contains numerous districts in which occur various varieties of iron ore, practically at tide water and in touch with vast bodies of fluxes. Deposits of particularly high grade manganese ore occur at a number of different locations.

Gold Marked development has taken place in this industry the past several years. The gold fields of the province cover an area approximately 3,500 square miles. The gold is free milling and is from 870 to 970 fine.

Gypsum Enormous beds of gypsum of a very pure quality and frequently 100 feet thickness, are situated at the water's edge.

High grade cement making materials have been discovered in favorable situations for shipping.

Government core-drills can be had from the department for boring operations.

The available streams of Nova Scotia can supply at least 500,000 h.p. for industrial purposes.

Prospecting and Mining Rights are granted direct from the Crown on very favorable terms.

Copies of the Mining Law, Mines Reports, Maps and other Literature may be had free on application to

HON. E. H. ARMSTRONG, - **Halifax, N. S.**
Commissioner of Public Works and Mines

To Users of the Callow Pneumatic Flotation Cell

THE recent decision in the Butte & Superior Suit with Minerals Separation has an important bearing upon the use of the Pneumatic, or Callow method of flotation.

The Appellate Court's decision at Philadelphia, in the Miami case, had already made clear the distinction between (1) froth produced by violent mechanical agitation of the Minerals Separation process, and (2) simple levitation by air bubbles, as practised in the Callow or pneumatic cell, without such agitation.

Now the Appellate Court at San Francisco has interpreted the United States Supreme Court's opinion in the Hyde case, whereby the Minerals Separation Patent was restricted to the use of a minimum, or 'critical' proportion of oil, in combination with violent mechanical agitation.

This latest decision of the Appellate Court in the Butte & Superior case, restricts the Minerals Separation basic patent to the use of a quantity of oil *not in excess of ten pounds (0.5%) per ton of ore, in combination with violent agitation*: it is a logical sequel to the Supreme Court's opinion and confirms the status of the Callow or Pneumatic method of flotation as distinct from the agitation-froth process.

Both the use (1) of oil in excess of ten pounds (0.5%) in combination with violent agitation, and (2) the use of the Callow system of aeration with any quantity of oil, appear therefore to be immune from any charge of infringement.

Front in Efficiency and Economy*

HARRIS HEAVY PRESSURE

The Aristocrat of Babbitts

St. Lawrence Paper Mills Co., Limited
Mille Roches, Ont.

The Canada Metal Co., Ltd., Fraser Ave., Toronto, Ont.
Dear Sirs:

We feel like putting in a good word for your Heavy Pressure Babbitt. We installed a very heavy machine some time ago, which had all brass boxes. The shafts weigh six tons each with a top roll weighing four tons, also a lever pressure making a total pressure of about fourteen tons. The brass boxes wore out in four weeks. We then put in Heavy Pressure Babbitt and am pleased to say that we have no more trouble. We put in Heavy Pressure in a very heavy machine eighteen months ago and there seems to be no perceptible wear.

We thank you for supplying us with a babbitt that gives such good results. Yours truly,

Per C. F. BUSS, Superintendent.

**FOR IMMEDIATE SHIPMENT
24**

60-TON standard gauge LOCOMOTIVES, built 1908-1909 by the Montreal Locomotive Works. In absolutely FIRST-CLASS RUNNING CONDITION. Complete with tenders and all equipment, and of the following specifications:

Weight on Drivers, working order	76,450 lbs.
Weight of Engine, working order	123,100 "
Weight of Tender, working order	138,950 "
Weight of Engine & Tender, working order.	262,050 "
Weight of Tender—Light, working Order..	60,650 "
Heating Surface—Tubes	1,230 sq. ft.
Heating Surface—Firebox	126 "
Heating Surface—Total	1,356 "
Grate Surface	28 "
Diameter of Driving Wheels	69 inches
Cylinders	18-inch diam., 24-inch stroke
Working pressure	200 lbs.

We will sell singly or "en bloc," at prices 20% less than these machines cost to build; 60% less than present prices.
